These scholars were the pillars of the teaching program of the institute until World War II. The list of students during the same period included Paul Mus, Jacques Faublée, Michel Leiris, André Schaeffner, Denise Paulme, Deborah Lifshitz, George Soustelle, Georgette Soustelle, Louis Dumont, André Leroi-Gourhan, Robert Gessain, Germaine Tillion, Jean-Pierre Vernant, Paul-Emile Victor, André Haudricourt, George Devereux, Germaine Dieterlen, Renee Maupoil, Leopold Senghor Segar, Jean Paul Lebeuf, Paul Levy, Roger Caillois, Pierre Métais, and many others (but not Lévi-Strauss). In most cases, students from law, philosophy, literature, or medicine were drawn to the institute because they were interested in a certificate that was exotic and supposedly easy to get. They were recruited to work as volunteers at the Museum of the Trocadéro. After obtaining their *licence* (equivalent to the U.S. bachelor's degree), students would enroll for a PhD (there was no master's degree at the time). Mauss and Rivet used their connections both in the French government and with the Rockefeller Foundation to find funding for students to do fieldwork. Fieldwork conducted by the institute's students was highly variable. There were fieldwork teams (e.g., the Griaule or Victor missions), others worked as married couples (e.g., Lévi-Strauss and Leroi-Gourhan), and occasionally, some worked as individuals. Some fieldwork lasted only a few days and some several years. Despite this diversity, all aimed to collect objects for the Ethnographic Museum and gather information for writing doctoral theses. Between 1926 and 1939, there were 104 missions. The first was undertaken in 1926, by M. Gromand (a student of Mauss), who traveled to Morocco to study the Berber. The fieldwork missions of this era fit into three broad categories: (1) missions carried out by colonial personnel, (2) missions carried out by students who studied with Mauss before the birth of the institute, and (3) missions carried out by the first generation of institute students. One of the most spectacular of these was the extravagant yacht mission sponsored by Count Étienne and Monique de Ganay. Between 1934 and 1936, the yacht crossed Oceania from Solomon Islands to New Guinea, bringing back to France thousands of objects that were deposited in the Trocadéro Museum.

In 1935, Rivet was elected deputy for Paris's 5th arrondissement. He was the first candidate to be supported by both communist and socialist voters. This combination of parties on the Left enabled the formation of the Popular Front government in 1936. Already chairman of the Anti-Fascist Committee, Rivet's political activism was intense. His deputy,

Georges River, took care of the Museum, and Mauss took care of the institute, which after 1938 was subsidized by the Ministry of Education. The objects brought back by the various missions were presented in numerous exhibitions at the Trocadéro Museum, which became the Museum of Man in 1938.

World War II and After

After the German defeat and occupation of France in 1940, many of the scholars associated with the institute went into exile: Rivet to Columbia, the Soustelles to London, and Alfred Metraux and Lévi-Strauss to the United States. Some joined the resistance and died in the war. When anti-Semitic laws were promulgated in 1941, Mauss was banned from teaching and was replaced first by Marcel Griaule and then later by Rev. Maurice Leenhart. Henri Vallois was appointed to replace Rivet as director of the Museum of Man in 1942. He, in turn, appointed Léon Pales as deputy director for physical anthropology and Griaule as secretary general of the Institute of Ethnology. Students of this era included Gilbert Rouget (b. 1916), Georges Balandier (b. 1920), Georges Condominas (b. 1920), Jean Poirier (b. 1921), Jean Guiart (b. 1925), and Jean Rouch (1917–2004).

On December 17, 1941, the Board of the Institute of Ethnology requested the establishment of a Chair of Anthropology in the Faculty of Arts at the Sorbonne. Griaule was elected to this position and thus became director of the institute. Reports of this era show that the institute had about 80 students each year. Most of these were French, but other nationalities were also represented. The French community of anthropologists, including physical anthropologists and prehistorians, had fewer than 50 people before the war. Many of these were still present after the war. However, Lévy-Bruhl died in 1939, and Mauss, although he survived until 1950, had become senile around 1943. Thus, of the institute's founders, only Rivet remained after the Liberation. He not only returned to his positions at the institute and the Museum of Man, but he also became very active in politics. Elected to Parliament in 1945, he held positions including vice president of the Foreign Affairs Committee of the National Assembly, chairman of the radio broadcasting committee, and vice president of the League of Human Rights. He was involved in the founding of the United Nations Educational, Scientific, and Cultural Organization as well as the reorganization of the National Center for Scientific Research. Thus, he had little time for the institute.

In 1949 and 1950, the institute had a teaching staff of 13, including Lévi-Strauss, Denise Paulme, Marcel Maget, Paul Mus, and Leroi-Gourhan. In 1945, an associate professorship of colonial ethnology had been created in the Geography Faculty of Lyon for André Leroi-Gourhan. Leroi-Gourhan was a student of Mauss who was decorated for the role he had played in the Resistance. Leroi-Gourhan focused on prehistory, often bringing his students to archaeological sites. However, his most important impact was on anthropological education. In 1946, he created the Centre de Formation a la Recherche en Ethnologie (CFRE; the Center for Training in Ethnological Research), a joint program with the Museum of Man, and the Office of Overseas Scientific and Technical Research. Students interested in the discipline during their *licence*, had now to complete their training, with two more years of study, before working on a thesis. The CFRE was in fact an extension of the teaching of the institute without being officially a part of it. The core of the teaching staff included Leroi-Gourhan himself, Jean Poirier, René Granai, Raoul Hartweg, Pierre Métais, and André Haudricourt. The program covered museology, human geography, anthropology, and ethnology, and included writing a thesis based on fieldwork in France. In 1946–1947, 15 students enrolled in CFRE, but only 9 passed the tests for the degree. By 1947–1948, applications had grown to 30. Eighteen students were admitted, but again relatively few of them passed the examinations and received degrees.

Twice, in 1926 and 1932, Mauss had unsuccessfully proposed the creation of a Section of Economics and Social Sciences in the École Pratique des Hautes Études. Anxious to develop the social sciences in France, the Rockefeller Foundation created it in 1947; and finally, the Ministry of Education gave its financial support in 1951. The initial faculty consisted mainly of historians (including Lucien Febvre and Fernand Braudel), who were joined by social scientists, including the anthropologists Lévi-Strauss, Roger Bastide, and Jacques Soustelle (who soon joined the government as Minister of Information). In 1950, Lévi-Strauss succeeded Leenhard, becoming director of the center for the Study of Religions of People without writing at the École Practique

des Haute Études. Lévi-Strauss became politically powerful in the new Economics and Social Sciences section, which was directed by Braudel, who, like Lévi-Strauss, had spent time in Brazil. Between 1953 and 1960, a generation of new young scholars, including Balandier, Paulme, and Condominas, were hired. The establishment created laboratories whose research missions were subsidized by the Rockefeller Foundation, and later by the Ford Foundation, and it offered an alternative education to that of the Institute of Ethnology and the CFRE of Leroi-Gourhan. When Griaule died in 1956, his Sorbonne chair was taken over by Leroi-Gourhan, and a second chair of ethnology was inaugurated by Roger Bastide in 1958. Pierre Jean Servier and Pierre Métais then received associate professorships in the University of Bordeaux (1953) and Nice (1965), and positions were created in Strasbourg, Lille, Montpellier, and other locations throughout France.

At that time, Leroi-Gourhan and Lévi-Strauss (elected to the Collège de France in 1959), codirected the Institute of Ethnology, but the discipline was already fragmented, and by the time of Rivet's death in 1958, the institute had lost power in the discipline. If it had lost hegemony over the organization of teaching and research, the institute had also lost its monopoly on publications as several collections of books and professional journals had appeared. In 1965, the CFRE was administratively attached to the Institute of Ethnology, but from 1966 to 1967, the Department of Sociology and Anthropology, led by Eric De Dampierre at Paris X Nanterre (now Paris West University Nanterre La Défense), and the Department of Ethnology at the Jussieu campus (now Pierre and Marie Curie University, Paris VI), led by Robert Jaulin (both ex-students of Lévi-Strauss), also offer *licences* in ethnology. This division of the field was further established after the May 1968 movement, and the Higher Education Reform Act reorganized teaching and research in independent units. These developments led Leroi-Gourhan to question the ability of the institute to operate in the new framework, and to Lévi-Strauss's resignation as codirector. Henri Raulin, Jean Guiart, and Claude Tardits were successive secretaries general of the institute, which was now reduced to its publications. In 1973, the now defunct institute left the University of Paris to become part of the National Museum of Natural History.

J

Jakobson, Roman O.

Roman Osipovich Jakobson (1896–1982) was a Russian-born linguist, literary theoretician, and semiotician.

Biography and Major Works

Jakobson was born on October 11, 1896, in Moscow and died on July 18, 1982, in Cambridge, Massachusetts. As an undergraduate at the philological faculty of Moscow University, he focused on Slavic studies and graduated, in 1918, with a master's degree for his work on Russian dialectology. Linguistics at that time was dominated by neogrammarians, who advocated a strictly genetic and historical approach that ignored the fact that the parts of language, in particular the sound system, form an internally cohesive system that regulates sound shifts or linguistic borrowing while being simultaneously tied to its use, to communication. On the other hand, Jakobson appreciated a model of language that treated it as an object of analysis as well as a creative tool rather than just a conduit of preexisting thoughts or a transparent window onto the object world. By the time Jakobson completed his undergraduate studies, he and his friends had become exposed to several key developments in the arts and sciences. But it was the new approaches to the study of language, in particular the work of the Swiss linguist Ferdinand de Saussure, that drew attention to the internal structure of language and provided a systematic, conceptual framework to describe it. Jakobson is often credited with being the first, in 1929, to use the term *structuralism*.

In 1915, Jakobson, together with his friends, established the Moscow Linguistics Circle and shortly thereafter, in Saint Petersburg, the Society for the Study of Poetic Language. Together known as Russian Formalism, these organizations promoted a programmatic approach to language and, in particular, verbal art. They brought together linguists, folklorists, literary scholars, and writers who emphasized the analysis of the intrinsic properties of literature and poetry as autonomous modes of expression that engage language in ways distinct from language's other uses. Jakobson, himself a poet, would train his analytical skills on the language of poetry, and it can be safely argued that it was from this vantage point that so much of his contributions to linguistics derive.

From 1920 until 1939, Jakobson lived in Czechoslovakia. He became fluent in Czech (he was already bilingual in Russian and French) and a close friend of avant-garde artists, poets, and playwrights. In 1926, he helped found the Prague Linguistic Circle, considered by many as one of the pivotal moments in 20th-century linguistics and aesthetics and the cradle of structuralism. In 1930, he received his doctorate from Prague University and, from 1933 to 1939, taught at Masaryk University in Brno. Many of Jakobson's groundbreaking studies in Slavic linguistics and poetics and his initial forays into general linguistics date from this period. Among them is his groundbreaking work with his colleague Nikolai S. Trubetzkoy in phonology, which first defined phonemes in terms of their distinctive

features that are both relationally invariant and yet work in consort with other units of sound, with which they form binary sets.

In 1939, Jakobson fled Nazi-occupied Prague together with his second wife, Svatava Pírková-Jakobson (a Czech folklorist), first to Copenhagen and Oslo, where he lectured and met with the Danish linguist Louis Hjelmslev, and then, in 1941, to Uppsala (Sweden). His pioneering work on child language acquisition and aphasia dates from these years. Both topics would reveal the intrinsic relationship between the brain's cognitive functions, the developmental logic of phonology's distinctive features, and the language of poetry. Jakobson asserted that the key figures of speech, metaphor and metonymy are present in all modes of language and thought and that they form part of the brain's cognitive and linguistic functions, a point widely accepted today.

After a brief stay in Sweden, Jakobson arrived in New York in 1941, where he taught at the École Libre des Hautes Études and later at Columbia University. A refuge for many exiled European artists and scholars, New York was a fertile crossroads of ideas and friendships that would define an era. Jakobson met Franz Boas and Benjamin Lee Whorf, who would introduce him to linguistic anthropology, in particular to the work of Edward Sapir. It was also while teaching at the École Libre that he first met Claude Lévi-Strauss, 12 years his junior, who attended his lectures on sound and meaning. The fundamentally holistic model of the American anthropologists dovetailed nicely with Jakobson's own, hierarchical understanding of language as a total phenomenon, as did their investigation into the relationship between language, thought, and culture. The close relationship between the two is not coincidental. Both schools of thought share the same historical source, namely, the German tradition associated with Alexander von Humboldt and Immanuel Kant.

Jakobson moved to Cambridge, Massachusetts, in 1949, where he was offered a professorship at Harvard in Slavic and general linguistics and where he would make his home with Svatava-Pírková and, later, his third wife, Krystýna Pomorská, herself a distinguished Slavicist. In 1957, he also joined the MIT faculty as head of the Center of Communication Science. Among the many publications that appeared during the postwar years, several stand out as pivotal to the development of a general theory of signs (semiotics), to the study of verbal art, and, in particular, to the development of linguistic and cultural anthropology. *Fundamentals of Language*, with Morris Hale (1956), marks the culmination of his long interest in the distinctive features that constitute the phonology of a given language. Instead of phonetic description, which focuses on the points of articulation (their human physiology), Jakobson, the student of verbal art, was drawn to the acoustic quality of the sound itself, noting that individual phonemes are distinguished from each other by the presence or absence of a feature (such as pitch), together forming a multidimensional grid of binary oppositions that define a language's phonological system and that, additionally, have a distinct semantic aspect (e.g., the *i* in "high" is pitched high, whereas the *o* in "low" has a low pitch).

His discovery of the American pragmatist philosopher and logician Charles Sanders Peirce's sign typology—symbol, index, and icon—allowed Jakobson to expand on de Saussure's distinction between the signifier (the sound) and the signified (the sense). The indexical sign operates by using a part of the signified (the sense) as the signifier, the form of the sign. In this relationship of contiguity (whether physical, special, or temporal), a part stands for a whole; for example, smoke is an indexical sign of fire. On the other hand, an iconic sign works through the similarity or likeness between the two parts of the sign, as, for example, a portrait painting stands in for the person depicted. Two important features about this expanded typology reinforce Jakobson's view of language. First, the underlying mechanisms of the index and icon correspond to the two fundamental figures of speech, metonymy and metaphor, respectively. Second, the relationship between the signifier and the signified is motivated and not arbitrary. Where this relationship could be thought of as given and natural, it is established by habit and is culturally relative. In fact, as Jakobson never tires of emphasizing, the two sides of the linguistic sign (symbol in Peirce's terminology) are also formed by habit and are culturally relative. Contrary to de Saussure, Jakobson argues that the very phonological makeup of a language can operate at the level of syntax and meaning in a nonarbitrary, relatively motivated way. And while this is best realized in poetry, Jakobson shows that it is present in nonpoetic language as well. For example, the word

long sounds long in contrast to *short*, which has a clipped, short sound to it. Once again, where the poetic function of speech dominates in verbal art, it proves, for Jakobson, to be the analytical gateway to the fundamentals of language.

In a landmark article, *Shifters, Verbal Categories and the Russian Verb* (1957), Jakobson drew attention to the manner in which the speech act is grammatically encoded; its intended meaning depends on referencing contextual information. Known as *deictic shifters*, personal pronouns, grammatical tense, place markers, mood (e.g., imperative, subjunctive, etc), and the evidential (e.g., whether the event reported is presented as witnessed, quoted, or remembered) are typical examples of indexical symbols (in Peirce's sense). These indexical symbols work to continuously position and reposition the participants in discourse vis-à-vis each other and the topic.

The conception of language as practice received its full elaboration in *Linguistics and Poetics* (1960). Inspired by the recent developments of communication theory, Jakobson's model of discourse consists of six factors and their corresponding functions. Typically, (1) an addresser sends (2) a message to (3) an addressee, but three additional components must be in place for the transaction to be successful: (4) a shared context (the referent), (5) the code (language) shared by both sides, and, finally, (6) contact, the physical, psychological, and social channel enabling the exchange. Most communication is focused on making claims by referring to objects outside of the speech act itself; that is, its function is cognitive (4). Traditionally, linguistics and the philosophy of language had been, in Jakobson's view, absurdly reductionist, because their attention was focused primarily on this function. But an act of speech may be oriented toward any one of the factors. The psychologist Karl Bühler had already shown that an explicative draws attention to the sender (emotive function), while a declarative and vocative phrase draws attention to the recipient (conative). It was Jakobson's attention to the message (2), the language itself (5), and also the channel through which the message was sent (6) that was groundbreaking and helped redraw the boundaries of linguistics research. Orientation toward the contact (6) dominates when the purpose of an utterance is primarily social (*phatic*, a term first suggested by Bronisław Malinowski). For instance, the greeting "Good day" is a social act of recognition, not a statement about the weather. Orientation on the code (5) as in "Can you repeat that?" elicits the metalinguistic function. Finally (2), when the message refers to itself (self-referential), it engages the poetic function of language. Rhythm, rhyme, elements of style, or ornamentation all work by selecting identical or similar units (from sound to meaning) and stringing them along contiguously. Jakobson devoted his life to analyzing the subliminal patterning of verbal art and highlighting the key place the poetic function or parallelism occupied in all discourse. This topic received its fullest elaboration in his landmark study *Poetry of Grammar and the Grammar of Poetry* (1961).

Contributions to Anthropology

Roman Jakobson was a prolific scholar; a selection of his works fills seven hefty volumes. His contribution to research in any one of the fields of inquiry he turned his attention to was always notable and, more often than not, pathbreaking. From his lifelong interest in verbal art through his analysis of the internal organization of language (phonology, morphology, syntax, and semantic) and the underlying logic of communicative practices (pragmatics) to child language acquisition, to his study of aphasia (a class of language disorders) and his work in general linguistics, semiotics (the study of a broad range of phenomena centered on the use of signs and signifying practices), and the history of linguistics, his presence is felt in a wide range of disciplines in addition to linguistics proper. Among these Slavic studies, comparative literature and literary theory, aesthetics, medieval studies, and the study of folklore can certainly lay claim to him. And, of course, so can anthropology. In fact, his broad take on language as both an object of investigation and a process implicated in all social and cultural practices arguably identifies Roman Jakobson as an important figure in the development of modern anthropology.

Claude Lévi-Strauss, Jakobson's lifelong friend, was undoubtedly his best known protégé. Of his mentor's many ideas, the following were pivotal to Lévi-Strauss: (a) the theory of distinctive features as sets of differences, (b) the identification of figurative language as generalizable linguistic forms and thought-governing rules, and (c) the conviction that both of these principles, among others, are universal and part of human makeup. Both Jakobson and Lévi-Strauss found further inspiration (and confirmation) in the

new developments in cybernetics, game theory, and, of course, genetics. All three place emphasis on information and on the underlying, rule-governing structures operating on a dualistic logic: the binary code.

The distinctive-feature model had a significant influence on the study of kinship (Lévi-Strauss, Rodney Needham), cognitive anthropology (Ward Goodenough), and mythology. In addition to the cross-cultural study of phonology, morphology, and grammatical semantics, Jakobson had an important impact on the linguistic and cultural analysis of deixis (the role of context in determining the meaning of speech), metalinguistics (the study of language in relation to culture and society), and metapragmatics (the functions of speech in discourse; William Hanks, Michael Silverstein); the ethnography of communication (Dell Hymes, James J. Fox); ethnopoetics (Steven Caton, Paul Friedrich); and, generally speaking, symbolic anthropology (James W. Fernandez).

Jameson, Fredric

Although he was born in Cleveland, Ohio, Jameson (1934–) spent most of his early life in New Jersey. He was educated at Haverford College and Yale University, studying French. He taught at Harvard University while completing his PhD dissertation on Jean-Paul Sartre, which was published in 1961 as *Sartre: The Origins of a Style*. When Harvard denied him tenure, Jameson moved to the University of California, San Diego, where he remained for more than a decade. He returned to Yale in 1982, joining the French Department, which had by this time become internationally renowned as the home of deconstruction. In 1985, he was recruited by Duke University to head up a new program in literature, and he has remained there ever since. Jameson is the author of more than 20 books as well as a great many articles and book chapters. There is virtually no 20th-century critic or theorist of consequence he has not engaged in dialogue.

Jameson's career cannot really be broken into stages as there are no major shifts of perspective or changes of focus. If an image is needed, then there may be no better way to envisage his career than to picture a stone dropping into a large pond. The ripples that spread wider and wider from that initial impact would represent Jameson's incredible appetite and capacity to absorb and process new ideas, new languages, new theories, and new kinds of media (his work embraces everything cultural, from poetry to opera to computer games). He began his career in French, but then spent the next 10 years or so mastering the leading lights of 20th-century German critical theory (Theodor Adorno, Walter Benjamin, Ernst Bloch, Georg Lukács, and Herbert Marcuse). This work yielded the magisterial *Marxism and Form* (1971) and the equally impressive companion volume, *The Prison-House of Language* (1972).

In the long essay concluding *Marxism and Form*, "Towards a Dialectical Criticism," Jameson plotted his basic hypothesis, which he has expanded and revised but never really altered in the 40 odd years since. His central idea is that all texts, be they literary, philosophical, theoretical, or even filmic, are produced in dialogue with history understood as an ineffable real. His next major work, *The Political Unconscious: Narrative as a Socially Symbolic Act* (1981), would give methodological substance to this idea. Jameson argues there that we cannot but historicize because it is as historicizing machines that cultural works are intelligible to us. Every work of art, every film, and every piece of music or literature communicates to us, at a minimum, the message that the time of this work is now, that in no other period in history before or since would it be possible. This

is why, as Gilles Deleuze argues (after Nietzsche), all great works feel untimely to us; they always arrive too soon. If they did not, they would seem neither new nor interesting, as our boredom with extinct forms attests.

The Political Unconscious transformed literary and cultural studies by offering a persuasive thesis explaining the relation between texts and history in anthropological terms as social and cultural purpose. For Jameson, history is an inexorable force; it is the outer limit, the necessary "beyond" or "horizon" of all human activity. He describes history as that which hurts, by which he means to say that history is a set of empirical facts (events unfolding across time), but goes on to add that it is only knowable as textual traces. His conception of history is, in this respect, something of an uneasy compromise between the skeptical viewpoint of poststructuralism and the absolutist position of Marxism. It accepts that history is not knowable to us in any complete way—we can never really know what the Romans thought or felt about their gods on an individual level, for example—but nevertheless insists that history is a constant force whose effects are to be seen everywhere. Culture is in this respect both a product of history and an active agent shaping history.

Borrowing from Claude Lévi-Strauss's interpretation of Caduveo face painting, Jameson argues that cultural texts manage (in a symbolic way) the multiple and various antinomies and contradictions that history throws at us. In brief, Lévi-Strauss's claim is that the Caduveo face paintings enact symbolic solutions to real social contradictions that cannot otherwise be resolved. For example, the various and complex power relations within the Caduveo tribe, and more especially in its relations with its neighbors, the Guana and Bororo, are "worked through" (in the psychoanalytic sense of resolving psychic tension by giving it expression) in a formal and aesthetic manner. In subsequent work, Jameson enlarged on this thesis to account for the cultural logic of contemporary late capitalism.

In the case of postmodernism, the subject of Jameson's next and probably most influential work, *Postmodernism, or, the Cultural Logic of Late Capitalism* (1991), it was the gloomy sense that somehow everything had ended: In art, in the wake of modernism, there was nothing new left to do; in politics, it was the end of the idea that government should be the engine of change; in capitalism itself, it was the end of the idea that the function of corporations was something other than sheer moneymaking; globally, it was the end of the idea of the nation as a discrete entity. Culturally, postmodernism responded to these forces by celebrating what remained—it made a virtue of pastiche, repetition, plagiarism, and unoriginality; it advocated an individualist approach to politics that made the resilient individual worker, who neither needed nor looked for security of tenure, the new hero of the age; it separated the idea and practice of creativity from the actuality of creating things, and in the process, it brought about a massive global realignment whereby design and sales is a First World activity, while manufacturing is exclusively a Third World activity. Although some critics suggest that postmodernism is over as a movement, it is clear that we are still in thrall to these forces.

For Jameson, the postmodern period is characterized by two major transformations: the shift from nature to culture as the key resource for capitalist growth and expansion, and the resulting penetration and colonization of the unconscious. Jameson's point is that, for the First World at least, the growth of capitalism depends on the exploitation of ideas, tastes, feelings, desires, and emotions, rather than the physical resources central to late-19th-century and early-20th-century capitalism. This does not mean that manufacturing is unimportant, but it does mean that in the first world it is no longer seen as a source of growth. In the 3 decades since Jameson made this claim, his thesis has certainly been borne out. These days, some of the largest corporations in the world, among them Google and Facebook, do not make anything at all. Their wealth derives from focusing and repackaging, and on selling our attention. As many commentators have pointed out, from the perspective of capitalism, we are not Facebook's consumers, we are its product: We use it, but it sells us (and all the information it gathers about us) to other corporations, which in turn try to sell us things. Insofar as it is meaningful to talk about manufacturing in postmodernity, it is noteworthy that the richest manufacturing corporation in the world, Apple, makes devices that absorb and indeed package our attention too. Jameson's basic point, then, is that the most valuable resource of our era is *attention* (and all that it entails), not coal, steel, oil, or any other extracted resource.

Inasmuch as *postmodernism* is an attempt to historicize an entire era, it is perhaps not surprising that it demanded several further installments to round out, if not complete, the global pen portrait Jameson wanted to sketch. This rounding-out process has been pursued in three distinct directions. First, there has been a straightforward expansion of the original material—*The Geopolitical Aesthetic* (1992), *The Seeds of Time* (1994), *The Cultural Turn* (1998), and *A Singular Modernity* (2002) all fall into this category. Second, Jameson has expanded on the theoretical underpinnings of his diagnosis—*Late Marxism* (1990), which describes Adorno's work as a joyous countertoxin to postmodernism, and *Brecht and Method* (1998) can be listed here. Third, he has produced a monumental work on modernism, the product of 30 years of musing on the subject, *The Modernist Papers* (2007), against which his account of postmodernism should be situated. In recent work, Jameson has tended to use the term *globalization* rather than postmodernism, but the thesis remains the same: He is interested in the cultural expressions of this most recent stage of capitalism.

If every great theorist must have an abiding passion or interest, then for Jameson it is the concept of the dialectic. It underpins all his writing and thinking but only infrequently receives direct or extended treatment. This changed with the publication of *Valences of the Dialectic* (2009), which also brings in full circle Jameson's earlier thoughts on history, particularly in *The Political Unconscious*. In addition, Jameson has also published two further works that can but be read as pendants: *The Hegel Variations: On the Phenomenology of Spirit* (2010) and *Representing Capital: A Reading of Volume One* (2011). Alongside these books, he frequently publishes new essays in *Critical Inquiry*, *New Left Review*, and the *London Review of Books*, his three favored journals. In 2008, Jameson was awarded the Holberg Prize in recognition of his enormous contribution to 20th- and 21st-century letters.

K

Kardiner, Abram

Although little read today, Abram Kardiner (1891–1981) was one of the founding figures of the Culture-and-Personality school of anthropology. His concept of *basic personality structure* provided a theoretical integration of social anthropology and psychoanalytic theory by showing that social structure and character formation inform and constrain each other. Kardiner was one of the founders in 1930 of the New York Psychoanalytic Institute, the first psychoanalytic institute in the United States. Not an anthropologist himself, Kardiner drew on the ethnographic research of Ralph Linton, Carl Withers, and Cora DuBois. In 1939, he published *The Individual and His Society* and in 1945, *The Psychological Frontiers of Society*. Both books consist largely of analyses by others, most prominently Ralph Linton and Cora DuBois. In the 1950s, Kardiner was a professor of psychiatry at Columbia University and, from 1955 to 1957, director of the Psychoanalytic Clinic. There he attended patients until just a few weeks before his death. His other books included *The Traumatic Neuroses and War* (1941), *Sex and Morality* (1954), *Mark of Oppression: Explorations in the Personality of the American Negro* (with Lionel Ovesey, 1951), *They Studied Man* (with Edward Preble, 1961), and *My Analysis With Freud: Reminiscences* (1977). Kardiner's influence on the emerging field of psychological anthropology is recognizable in the work of John and Beatrice Whiting, Clyde and Florence Kluckhohn, Weston LaBarre, Anthony F. C. Wallace, Melford Spiro, Gananath Obeyesekere, and Howard Stein.

Biography and Major Works

Abram Kardiner was born in New York on August 17, 1891, and graduated from the City College of New York. In 1917, he received his medical degree from Cornell and interned at Mount Sinai Hospital for 2 years. Kardiner had just completed his psychiatric residency when he was accepted as a patient by Sigmund Freud in Vienna. Freud set two conditions for Kardiner's analysis: that it last only 6 months (1921–1922) and that he be paid $10 a session in American dollars. He was proud of the fact that Freud acknowledged him as a *Menschenkenner* (knower of people). Kardiner ended up departing from Freud in placing less emphasis on the instincts and their vicissitudes. Instead, he developed an enduring interest in the ego and its adaptive mediation of biological drives and institutional disciplines. Soon he came to see culture as a set of environmental and social structural exigencies and the basic problem of individual development as the culturally specific means available for the adaptation of the ego to these exigencies. His key insight was that cultural values derive from, and provide compensation for, institutionalized constraints—constraints shaped in relation to the social and economic environment.

In the 1930s, Kardiner joined with several anthropologists to study the processes by which culture is transmitted from one generation to the next, and

it was at this time, working with anthropologists such as Ruth Benedict and Cora DuBois, that he formed his concept of the basic personality structure. The structure is a configuration shared by most of a society's members as a result of the experiences they have in common. It does not correspond to the total personality of the individual but to the value-attitude systems that are basic to the individual's personality configuration. The concept was meant to integrate patterns of child care and training with social institutions, values, and roles. The ego is the site of this integration, in keeping with the view associated with psychoanalytic theory that the basic disciplines of infant and child care play a significant role in the formation of personality. According to Kardiner, the basic personality structure was formed by primary institutions. Primary institutions (subsistence methods and family organization) establish structures for the formation of the individual ego, and the ego, in adapting to these structures, generates secondary institutions that include symbolic systems such as folklore, myth, and ritual. Secondary institutions in turn shape child-rearing practices and personality structure.

Kardiner hypothesized that the structure of the ego derives from culture-specific problems of psychological adaptation. He was not interested in the Oedipus complex or in other classic Freudian dimensions of the id and the superego, although he accepted the reality of instinctual drives. Kardiner did not reduce cultural formations to the development of psychosexual states or the renunciation of libidinal desires. In fact, he argued that describing a culture in Freudian terms such as anal or erotic was useless. Kardiner instead focused on the ego as an *adaptive* mechanism that mediated biological drives and institutionalized disciplines. The ego adapts to its environmental and social conditions, and this adaptation, in turn, shapes the formation of cultural institutions that exist to defend against and provide substitute satisfaction for the frustrations established by these socially and historically contingent disciplines.

Kardiner tended to avoid notions of causality—the "chicken or the egg" problem—by stressing that primary and secondary institutions can only be analyzed in reciprocal interaction with each other. Still, he accepted to some degree the Freudian view that the basic disciplines (of infant and child care) constrain the formation of "basic" personality—that is, the personality structure that is common to all members of the social group who are similarly conditioned by the same practices. He argued, for example, that premature sphincter discipline in Tanala child training created the template for obedience to authority in adulthood—a defensive adaptation that was reinforced in the relation of father and son, with its constant relationship between obedience and security, loyalty and protection.

In his 1939 magnum opus *The Individual and His Society*, Kardiner drew on the fieldwork of Ralph Linton (his coauthor in all but name) among the peoples of the Marquesas Islands and the Tanala of Madagascar. Simpler societies were preferred because the authors assumed that small-scale, tribal societies possess relatively uniform institutions conditioning basic ego constellations. In the Marquesas, widespread and regular famine led to female infanticide and a skewed adult sex ratio, with men outnumbering women more than 2 to 1. This, Kardiner said, gave rise to polyandry as a primary institution and also to a cultural emphasis among women on maintaining erotic attractiveness; after all, they had several husbands, not just one, to keep happy. Kardiner found a corresponding de-emphasis of the relationship between women and their children, and he asserted that this led to a neglect of breast-feeding. In the Marquesas, this led to frustrations and an unfilled longing for dependency. Dissatisfactions of this sort became the elements of Marquesan myth, a secondary institution that both represents and attempts to resolve the underlying anxieties of early childhood.

Among the Tanala of Madagascar, Kardiner found that the ancestral spirits—a secondary institution—projectively recapitulated the relationship between father and son. Sons were trained to be obedient to their fathers, following the expectation that they would later inherit the fathers' land. But the recent shift to wet rice cultivation and the increasing economic insecurity—the result of the decline of the joint family and its replacement by a complex caste system—meant that sons could no longer expect the same benefits, no matter how well they ingratiated themselves with their fathers. Primary institutions, in other words, inhibited successful ego adaptation and led to beliefs about malevolent ancestral spirits. The construct of "spirit" is the Tanala symbolic representation, or projection, of the hostility to fathers.

Projection is a form of ideational representation whereby a person attributes his or her feelings or

psychology to an external person or object. Among the Marquesans, for example, a belief in supernatural *vehini-hia*—"wild women" feared by children as cannibalistic—is a projective manifestation of unsatisfied and inverted desires centered on the mother. Fantasies and fears about food and about eating/being eaten are reinforced by the material circumstances of Marquesan society, especially the tendency for famine.

Kardiner recognized that in the absence of better empirical data he could not make strong testable claims about culture and personality. When the anthropologist Cora DuBois returned from the Indonesian island of Alor in 1939, Kardiner thought the moment had come, since DuBois had collected detailed autobiographies and projective test results. Kardiner inferred from this information that precarious material circumstances led mothers to neglect the regular feeding of their children and to provide inconsistent disciplines of rewards and punishments. Children's "unsatisfied orality" and fear of abandonment gave rise to a pervasive sense of distrust and suspicion, which impeded the formation of strong social bonds. Alorese religious beliefs—a secondary institution—mirrored their early upbringing, with ancestor spirits considered by the people of Alor as at best fickle and more likely to do harm than good. Not surprisingly, Kardiner noted, Alorese myths and legends were suffused with fantasies of revenge—a feature no doubt motivated, he said, by the child's wish to visit retribution on his emotionally detached and unreliable mother.

The study of Alor appeared in Kardiner's second famous book, *The Psychological Frontiers of Society*, published in 1945, which also included chapters on the Comanche (by Linton) and white Americans in "Plainville," a small town of 175 inhabitants in the American state of Missouri (based on fieldwork by "James West," the nom de plume of Carl Withers). Unlike the Alorese, Kardiner concluded, the mothers of Plainville did not convey mixed messages to their children, and in fact, most children grew up idealizing their mothers. Fathers, on the other hand, could not provide sufficient rewards for submission to their authority, and their arbitrary punitive acts led children (especially sons) to leave home early. Kardiner believed that the Protestant deity worshipped in Plainville's churches represented transplantations of the father in the household and of the conditions under which he loves and forgives or reinstates. In Plainville, Kardiner saw the United States—indeed, the Western world—in microcosm, and he even went so far as to state that his conclusions applied just as well to Sophocles and Shakespeare.

Frequently overlooked in discussion of Kardiner's approach is his work on American race relations, "war neuroses" (now called posttraumatic stress disorder), and unemployment during the Depression. In the case histories that constituted *The Mark of Oppression* (1951), Kardiner and his collaborator Lionel Ovesey studied the external sources of prejudice in relation to the internal sources of self-hatred in African Americans living in Harlem. Although a pioneering work, the study has been criticized for assuming that there is no Black culture independent of its construction by oppression. On the traumatic neurosis of war, he came to see that the defensive maneuver to ward off the trauma sometimes destroyed the individual's adaptive capacity. The traumatic neurosis of war, he claimed, was the result of an adaptive failure, not a conflictual illness. Finally, with reference to Depression-era unemployment, Kardiner warned that economically insecure people are prone to masochism and become fodder for ruthless demagogues who promise relief from aggression directed toward the self. Government-sponsored work relief can help—Kardiner's nod to the New Deal—but he worried that the lowered expectation of competition cannot lead to permanent security in the workforce.

Critique of Kardiner's Approach

The difficulties with Kardiner's approach, as noted at the time, are that it says little about the development of real personalities in the cultures under discussion; the distributions of personality types within cultures; the dynamics of the personality-culture interaction, especially in the context of social change; and the relevance of the basic-personality approach to complex societies. Anthropologists criticized Kardiner for attempting to reconstruct the basic personality of a culture without data on specific individuals and without testable hypotheses. Margaret Mead even considered it arrogant. Meanwhile, psychoanalysts criticized Kardiner for minimizing or omitting the Oedipus complex and the tripartite structure of the psyche. In fact, Kardiner disputed the universality of the Oedipus complex and believed that it only emerged when cultural proscriptions of sexual behavior result in the fusion of sexual and dependency needs toward

the mother. This was the case, he said, in Plainville, and by extension in most of Western culture.

Concluding Remarks

Abram Kardiner attempted a synthesis of cultural and Freudian analysis, and while the concept of "basic personality" as the structure that mediates "primary" and "second" institutions has been dropped, the interest in cultural systems as projective systems remains. Psychoanalytic anthropologists (e.g., Spiro, Stein, and LaBarre) continued to relate concepts of morality and the religious to the exigencies of early childhood, and even today there is still a lively debate on the universality of the Oedipus complex. The eclipse of the Kardinerian approach, in fact, has less to do with the rejection of psychocultural synthesis than with the general retreat from encompassing social theory in the field of anthropology as a whole. Kardiner hearkens back to an earlier phase in the development of the discipline, to a time when it was considered possible (even necessary) to connect biological, political/economic, cultural, and psychological dynamics.

Kluckhohn, Clyde

Clyde Kay Maben Kluckhohn (1905–1960) made three significant contributions to the discipline of anthropology—(1) his pioneering ethnography, (2) his innovative approach to cultural theory, and (3) his long-term service to the profession. His field studies of the Navaho Indians of New Mexico are still unsurpassed, and he was one of the founders of the subdiscipline known as culture and personality, or psychological anthropology. As an organizer and administrator, he was a major figure in the development of cultural anthropology from 1936 until his untimely death in 1960, and he spent most of his academic life at Harvard University as a student and a professor. He was a central figure in creating institutional bonds among anthropologists at different universities, and between them and agencies of the federal government. During World War II, Kluckhohn served with the U.S. Office of War Information, analyzing the problems of morale in the Japanese population. After the war, he was the first director of the Russian Research Center at Harvard, founded in 1947 with a Carnegie grant. He served as chair of the anthropology department from 1957 until his death and was also at various times director of Harvard's Institute of Ethnic Affairs and a consultant to the U.S. Indian Service.

Biography

Born in Iowa, Kluckhohn received his undergraduate education at Princeton and the University of Wisconsin, before attending Oxford University on a Rhodes scholarship, graduating in 1931 with a master's degree in social anthropology. At Oxford, he was exposed to the "culture-circle" ethnohistorical theories of Wilhelm Schmidt at the University of Vienna, before returning to the United States to take his doctorate in anthropology from Harvard University in 1936. His major intellectual influences at Harvard were the sociologist Talcott Parsons and the social psychologist Gordon Allport, as well as the linguist Edward Sapir, who was then at Yale University. Immediately on finishing his doctoral studies, Kluckhohn joined the Harvard faculty. His doctoral dissertation was largely a composite of then current anthropological theories, titled simply *Some Aspects of Contemporary Theory in Cultural Anthropology*. It has not been published.

Kluckhohn's 1936 dissertation reflected his academic training up to that time. It was a survey, one might say a hodgepodge, of ideas from the Boasians, from structural functionalism, from the culture circle, and from recent psychology, with Kluckhohn taking the role of synthesizer of these

various topics and themes. This was a pattern that continued throughout his career: Kluckhohn was an eclectic synthesizer, never developing a tight theoretical scheme of his own.

Kluckhohn had become acquainted with the Navaho Indians when, as a 17-year-old, he was sent to the Southwest to recover from a serious disease, probably tuberculosis. Kluckhohn stayed with a mother's cousin on a sheep ranch bordering the Navaho Reservation. Over the next few years, Kluckhohn not only recovered from his illness but also became an expert horseman, traveling about the Reservation and learning to speak Navaho. He wrote two travel books on these experiences, *To the Foot of the Rainbow* (1927) and *Beyond the Rainbow* (1933).

Kluckhohn and Anthropological Theory

Perhaps Kluckhohn's theoretical posture as he graduated from Harvard in 1936 can be best understood if we picture him with a wealth of diverse theoretical training in his background, from social anthropology to psychiatry, returning to the Navahos for professional ethnographic work after a long absence. Like other intellectuals of his generation who went on to become the founders of culture and personality studies, Kluckhohn was in a marvelous position to create a novel theoretical perspective as he undertook the integration of the various schools of theory he had studied. This position was enhanced during the next decade by the increasing possibilities of global fieldwork made possible in the wake of World War II, because of global political changes and the increase in available funding.

Although Kluckhohn continually published ethnographic works over the next 2 decades, they were not necessarily coordinated among themselves or congruent with the theoretical work he published in the same period. Talcott Parsons and Evon Vogt observed that Kluckhohn's failure to publish a full-scale ethnography of the Navaho often drew criticism from his colleagues. The most thorough and best structured of Kluckhohn's ethnographic works is undoubtedly *Navaho Witchcraft* (1944), which comprises 242 pages of first-person narrative based on fieldwork conducted in the 1930s. Strangely for ethnographic books of the day, it is not richly illustrated and contains but one tiny drawing (p. 187) and no other diagrams or maps. But the book is cogent and well written, and it attracted a large nonprofessional audience as well as the admiration of colleagues and students.

Ten additional previously published pieces of Navaho ethnography are collected in Kluckhohn's Festschrift, published in 1962 as *Culture and Behavior*, edited by his son Richard Kluckhohn. They address ethnographic topics such as women's songs, ceremonial patterns, dreams, socialization, and personality formation. But altogether, these published works do not constitute a complete ethnography. Missing, for example, are quantitative examinations of major topics such as demography and Navaho techniques of farming and stock raising.

Values Orientation Method

Historians and critics of the field of culture and personality usually place Kluckhohn among the founders, alongside Ruth Benedict, Erik Erikson, Ralph Linton, Margaret Mead, Edward Sapir, and Benjamin Whorf, although some observers have assigned him to a secondary echelon of theorists, along with Cora DuBois and Abram Kardiner, perhaps because of his eclecticism. In any event, Kluckhohn's particular theoretical contributions to the field became known as the Values Orientation Method, or sometimes "The Harvard Study of Values," an approach that is probably best known from *Variations in Value Orientations*, written by his wife, Florence Kluckhohn, and the University of Chicago psychologist Fred Strodtbeck, published a year after Clyde Kluckhohn's death. In general, the principal themes of the Values Orientation Method spread among Kluckhohn's many books and articles can be summarized as follows:

1. *The importance of psychoanalysis in uncovering cultural attitudes:* Kluckhohn not only believed that authentic but masked attitudes could be uncovered from native subjects but also suggested that ethnocentric biases among anthropology students, which might impede their success in the field, could be detected and resolved by their own psychoanalysis, which he recommended for aspiring fieldworkers. He asserted that psychoanalysis was "scientific."

2. *How cultural attitudes affect international politics*, especially war making, by reference not only to his own research but also to the swaddling and toilet-training hypotheses developed by psychological anthropologists including Ruth Benedict and Geoffrey Gorer during and immediately following

World War II: These blossomed into the "National Character Studies," which played an important role in anthropology in the 1940s and early 1950s. However, such studies invited harsh criticism largely because they were based on literary sources and the memories of expatriates, rather than fieldwork. Kluckhohn observed and participated in a subsequent debate about the utility of such studies, largely through his role in the Russian Research Center.

3. *The beneficial effects of "culture crossing":* Far from being a racial or a cultural chauvinist, at least in his early years, the young Kluckhohn saw the social and intellectual benefits that accrued to persons of "mixed" ancestry; mostly he meant mixed European ancestry. Later in his life, he was sometimes ambivalent about the effects of Black-White "miscegenation" on personal behavior. Especially in Chapter 5 of *Mirror for Man*, titled "Race: A Modern Myth," Kluckhohn seems to hedge against a strictly egalitarian position concerning racial differences, suggesting that "temperament," "mental capacity," and musical ability might be unequally distributed among the "races."

4. *Making anthropology more "scientific":* Although Kluckhohn continually used the word appreciatively, it is not clear what he meant by "science." Perhaps he meant only "logic" or "clear thinking." He does not seem to have believed that science required defining variables, hypothesizing the consequences of the interactions among variables and testing the hypotheses by experiments that are replicable. Rather, Kluckhohn tended to use the term *science* rather loosely. Although he admired statistical work, his own research was not quantitative.

5. *Values Orientation Theory:* This was spun off Kluckhohn's ideas about national character and explicitly comprised analysis of the following topics as treated in different cultures: (1) Human Nature, (2) the Man-Nature Relationship (developed with his wife, Florence Kluckhohn), (3) Time, (4) Activity, and (5) Social Relations. This formulation of a research agenda has probably attracted more negative attention than any other of Kluckhohn's theoretical constructions. All the social sciences seems to be embodied in number 5, while number 3, Time, seems to be more a philosophical than a social science category. Carried forward by Florence Kluckhohn and Fred Strodtbeck after Clyde Kluckhohn's death, Values Orientation Theory stimulated a generation of social psychology students in the 1960s.

6. *The importance of language:* As an ethnographer, Kluckhohn was especially attentive to native language, and was probably at his best when describing the language used in Navaho ceremonies. In the narrative portion of *Navaho Witchcraft*, he provided 130 pages of description, which admirably employed the social anthropology he learned at Oxford. This material is preceded by a phonetic guide and followed by rich, substantial appendices totaling 85 pages, concerning details of language, the context of language use, and symbolism. He was especially careful in noting semantic variation in the terms he recorded.

Key Later Works

Kluckhohn's early theoretical contribution *Personality in Nature, Culture and Society* (1948), coedited with Henry Murray, was intended as a textbook for culture and personality. It incorporated contributions from a number of distinguished anthropologists—Benedict, A. Irving Hallowell, Jules Henry, Mead, Hortense Powdermaker, and John Whiting—and articles from psychologically oriented scholars such as Allport, J. S. Bruner, John Dollard, Erich Fromm, and David Levy. Contributions from the sociologists Robert Merton and Talcott Parsons were also included. For many scholars of culture and personality, this became the standard textbook and reference in the field. For their part, Kluckhohn and Murray essentially defined the field in this volume in two coauthored articles titled "Outline of a Conception of Personality" and "Personality Formation: The Determinants."

The next year, Kluckhohn published *Mirror for Man* (1949), which by 1971 had gone through 17 printings. It was written, as Kluckhohn put it in his preface, "for the layman, not for the carping professional." It became a standard introductory textbook for anthropology in many colleges and universities in the 1950s and 1960s. It not only covers the four traditional fields of anthropology—biological, archaeology, social cultural, and linguistic anthropology—but also, not surprisingly, contains a full chapter on culture and personality.

Another side of Kluckhohn's character and intellect is also exhibited in *Mirror for Man*: his American patriotism or national chauvinism. Especially in view of Kluckhohn's statements regarding the need for psychoanalysis to purge ethnocentrism from the thinking of potential fieldworkers, certain statements in the book seem out of place. In Chapter 9, for example, Kluckhohn claims that no people moralize as much as Americans and that American mothers offer love to their children based on their meeting certain performance standards, as if this kind of behavior provides contrasts with normal or ideal behavior in other cultures. But no concrete evidence is offered. Kluckhohn tried to correct this methodological deficiency in an article published in *Daedalus* in 1958, explicitly endorsing a "conservative" political perspective, based on colorful interviews of 69 young men in the Boston area, sponsored by the Russian Research Center. As director of the center, Kluckhohn repeatedly criticized Soviet values and politics, while in *Mirror for Man* and the *Daedalus* article, he embraced the parallel but allegedly opposite moral precepts of his native country.

For many people, especially colleagues and graduate students in anthropology, Kluckhohn's most useful and enduring book is *Culture: A Critical Review of Concepts and Definitions*, coauthored with Alfred L. Kroeber and first published in 1952. It begins with a 70-page history of the word *culture* and then moves on to an equally lengthy list of specific uses and definitions of it, divided into the categories of Descriptive, Historical, Normative, Psychological, Structural, Genetic, and Incomplete. This is followed by a section of comments and criticisms by philosophers and scientists of the past, and a final section where Kroeber and Kluckhohn try to make sense of it all. As professors and students have discovered over the past half-century, the value of the book is that Kluckhohn and Kroeber have raised these issues in such an interesting and entertaining manner. The basic idea and pedagogy of this book, as well as his careful work in Navaho ethnography, probably constitute the heart of Kluckhohn's intellectual legacy.

Kroeber, Alfred L.

Alfred Louis Kroeber (1876–1960) was the leading American anthropologist of his generation. Widely regarded as the successor to his mentor, Franz Boas, he dominated the discipline during the first half of the 20th century.

Biography and Major Works

Alfred Kroeber was born in Hoboken, New Jersey, and grew up in New York City. His German immigrant father was an upper-middle-class importer. As a child, Alfred was bilingual, speaking German at home. The broadly humanistic culture of German immigrants was a decisive influence on his intellectual formation; the study of natural history was also fundamental to his development. He was educated at Columbia University, earning bachelor's (1896) and master's degrees (1897) in English literature.

In 1896, Kroeber was introduced to Franz Boas and anthropology. His earliest anthropology research was with a group of Inuit (Eskimo), then living in the city. For his doctoral dissertation on Arapaho Indian decorative symbolism, Kroeber did fieldwork in Wyoming and Oklahoma (1898–1899),

sponsored by the American Museum of Natural History, where Boas served as a curator. His 1901 doctorate was the first to be awarded by Columbia for anthropology.

Kroeber first came to California in 1900 for a curatorial position at the California Academy of Sciences, San Francisco, but he soon left when it became clear that there would be little provision for field research. In the fall of 1901, Kroeber was hired by the University of California, which had just initiated a department and museum of anthropology, founded by the regent, Phoebe A. Hearst. With periods of sabbatical and leave, Kroeber spent the rest of his professional life at the university, serving as instructor (1901), assistant professor (1906), associate professor (1911), and professor (1919), retiring in 1946 as professor emeritus. In the University of California's Museum of Anthropology, he served as curator and director. Although he effectively held these positions from 1901 and 1909, respectively, the titles were not formally given until 1909 and 1925.

Most of Kroeber's fieldwork was in California, especially between the years 1901 and 1911. In 1903, he began a systematic survey of California Indian cultures, including his own fieldwork and that of his students and colleagues. Between 1911 and 1916, Kroeber worked with Ishi, the last Yahi, who lived at the museum, then in San Francisco. Today this ethnographic relationship is probably the thing for which Kroeber is most famous, at least in the mind of the general public. With his publication of the summary *Handbook of the Indians of California* in 1925, Kroeber effectively founded the scholarly study of California Indians.

During the 1910s, Kroeber spent several summers in Zuni, New Mexico, sponsored by the American Museum of Natural History. During the first 6 months of 1918, he focused on the museum's Philippines collection, curating an exhibition and writing an excellent handbook, despite his lack of any fieldwork in the country.

By the late 1910s, following the deaths of his wife, Henrietta, and of Ishi, Kroeber underwent a personal and professional crisis. He became interested in psychoanalysis and developed a private practice in the field (1918–1923) before returning full-time to anthropology.

Although Kroeber had not been interested in archaeology during his early career, after 1920, he turned increasingly to the field, as he worked with the ancient Peruvian collections at the university museum. His study of Max Uhle's collections with the graduate students William Duncan Strong, Anna Gayton, and Lila O'Neale led to his excavations in Peru (1925, 1926, and 1942), the first two trips sponsored by the Field Museum in Chicago. For the rest of his life, Kroeber continued to study the chronological development of Nasca pottery designs.

Kroeber's lifelong interest in geography, encouraged by his Berkeley colleague Carl Sauer, culminated in his 1939 monograph on *Cultural and Natural Areas of Native North America*. Leading up to this study was a second survey of California Indians, the Culture Element Distribution Survey, carried out by his students.

Kroeber's last major work was *Configurations of Culture Growth* (1944), an ambitious comparison of civilizations, focusing on the development of artistic styles. He extended these ideas in a series of late lectures, published as *Style and Civilizations* (1957).

As a noted teacher, Kroeber mentored at least two generations of students, from Samuel Barrett, the department's first doctorate in 1908, through a cohort of important students in the late 1920s and 1930s, including William Duncan Strong, Julian Steward, Cora DuBois, Ralph Beals, George Foster, and Robert F. Heizer. With his fellow Boasian Robert H. Lowie and his protégé Edward W. Gifford, Kroeber made the department the largest and most important, as well as the oldest, in the American West. With his student Thomas T. Waterman, Kroeber wrote the first—and for many years, the only—textbook in the field: *Anthropology* (1923; revised edition, 1948).

Alfred Kroeber played a dominant role in the institutional organization of the discipline of anthropology: as one of the founders of the American Anthropological Association in 1902 and as its president (1917–1918). He was also president of the American Folklore Society (1906) and a founder of the Linguistic Society of America (president in 1940).

He helped organize displays of anthropology and Native American culture for the Golden Gate International Exposition, San Francisco (1939–1940); during World War II, he was the director of an Army Special Training Program at Berkeley on the cultures and languages of East Asia (1943–1945).

After his retirement, Kroeber continued to teach, travel, and write. During these years, he focused on issues of style and comparative civilizations.

His stature in the discipline was indicated by the comprehensive conference he organized in 1952, whose proceedings he edited as *Anthropology Today: An Encyclopedic Inventory* (1953). In the 1950s, Kroeber offered testimony on aboriginal occupancy of territory for the U.S. Indian Claims Commission, arguing against his former student Julian Steward. Although a social and political liberal, he believed that these personal values should be kept separate from his professional efforts. He also spent much time going over old research, preparing manuscripts for publication.

Kroeber was married twice: first to Henrietta Rothschild in 1906, who died in 1913, and for the second time, in 1926, to Theodora Kracaw Brown, who later became famous for her writings on Ishi. Along with his two stepsons, Theodore and Clifton, Kroeber had two children with her: Karl and Ursula (later LeGuin, the science fiction author).

Alfred Kroeber died in Paris, shortly after attending a conference in Austria. Over his lifetime, he was awarded numerous prizes and honorary doctorates, and the anthropology building at the University of California, Berkeley, was named after him in the year of his death. Kroeber's personal papers were given to The Bancroft Library, University of California, Berkeley.

Critical Contributions to Anthropology

Alfred Kroeber considered himself first of all an ethnologist, but given his wide-ranging interests and long life, he was able to make contributions to many areas of anthropology, including archaeology and linguistics as well as sociocultural anthropology. Virtually all of Kroeber's anthropology can be traced to his conception of culture and its patterning in space and time.

Culture Theory

Alfred Kroeber generally integrated his theoretical discussions with descriptive presentations. However, in his late anthology *The Nature of Culture* (1952), he explicitly summarized his cultural theory. Here, he restated his position that culture was a coherent and separate phenomenon that gave the discipline of anthropology its scholarly autonomy.

In his general orientation, Kroeber's anthropology was based on a unique combination of empirically rooted disciplines: natural history and the humanities; he fought against the grouping of anthropology as part of the social sciences. Despite his earlier background in natural history and his later foray into statistics during the Culture Element Distribution Survey, in the end, he shunned predicative models of causality and denied that anthropology was a science. In a famous debate with Boas in the 1930s, he accused his teacher of being more interested in causal explanation and the discovery of general laws.

Kroeber's most famous contribution to anthropological theory was his concept of the "superorganic," published first as an article in the *American Anthropologist* (1917). In opposition to Edward Sapir and many of his colleagues, he de-emphasized the role of the individual in culture. For Kroeber, culture applied only to a collective level, a world of meaning, norms, and values, and as such could not be explained by relating it to psychological or biological phenomena. With Clyde Kluckhohn and Talcott Parsons, he later distinguished between culture, viewed as a pattern of meaning, and society, which he applied to the behavior of individuals and groups.

Kroeber shared his basic theory of culture as patterning with Boas and many of his students. Employing a set of related terms to characterize cultural wholes—patterns, complexes, and configurations—he emphatically avoided analyses of structure and function. He felt that a comparison of these holistically conceived cultural types could reveal the processes of their historical productions. Kroeber expanded these perceptions, first worked out among tribal societies, to the styles of entire civilizations. This kind of metahistory was similar to the work of Herbert Spencer, Oswald Spengler, and Arnold Toynbee.

Kroeber's cultural relativism was basically Boasian, although, unlike Boas, there was a stronger residue of Victorian evolutionism and cultural ranking (derived from E. B. Tylor and Spencer).

Ethnography and Geographical Orientations

As a student of Franz Boas, Kroeber made important contributions to ethnography, most notably in California but also in the American Southwest, Plains, and Arctic. Among this work was important intensive study of particular peoples, advocated by his mentor: especially the Yurok and Mojave. Like

Boas, Kroeber never wrote a single, comprehensive ethnography of any particular culture. Yet, unlike Boas, throughout his life, Kroeber stressed survey and cultural comparison. Along with Otis T. Mason and Clark Wissler, Kroeber was one of the prime formulators of the concept of culture areas. His concerns with cultural boundaries and mapping led to the definition of culture regions of Native North America. He extended this comparative approach in his work on civilizations.

Like most ethnographers of his generation, Kroeber's conception of ethnography was not what we would call participant observation. Instead, it was essentially the collection of memory culture, based on collecting data and interviews. Taking these sources, his ethnographic work is characterized by a focus on the "ethnographic present," not the tracing of historical developments in the postcontact period. His interest in cultural reconstruction was embodied most thoroughly in his California handbook, published in 1925. Despite his knowledge to the contrary, he did not want to take into account the massive genocide and culture change under which these populations had suffered. This approach was most notable in his writings on Ishi. Also like his mentor, Kroeber never taught ethnographic methodology, expecting his students to pick up the necessary skills on their own.

Temporal Styles and the Comparative Study of Civilizations

Another aspect in which Kroeber went beyond his mentor was his greater emphasis on temporal patterns. He famously explored this topic in several essays (1919 and 1940) on historical trends in European women's dress styles, especially hem lengths, which he correlated with periods of political instability. Kroeber was one of the pioneers in developing the archaeological method of seriation: a system of relative dating based on design sequences or the changing frequency of styles. He first applied this perspective in 1916 to the design styles of Zuni potsherds and later to the pottery styles of Nasca, Peru.

Between 1934 and 1938, Kroeber sent 13 students to 254 tribes or bands in the American West to determine the presence or absence of hundreds of ethnographic traits in these societies. The results of this work were published in 25 reports. This tracing of the distribution of discrete and narrowly defined cultural "elements" was almost the opposite of his earlier, and later, work on cultural patterning and integration.

Partly as a result of his belief that this atomistic methodology had failed to explain cultural processes, Kroeber turned increasingly to so-called "configurational" approaches. Not recognizing any substantive differences between tribal societies and states—only methodological ones—for him it was more a question of finding the suitable historical documentation for his analyses. In his later work on cultural creativity, he related the production of individually creative works to evolving collective traditions. Nevertheless, he maintained a cultural determinism, allowing relatively little room for personal creativity. This collectivist orientation also underlay his general antipathy to the Culture-and-Personality school of the 1930s (despite his sympathy for Benedict's concept of patterning).

Kinship and Social Organization

Although kinship study was not one of his major theoretical areas, Kroeber did make an important contribution to the field. In his 1909 essay "Classificatory Systems of Relationship," he argued that kin terms should not be regarded as direct reflections of social systems but more as linguistic or conceptual categories. This position, the basis of his "Zuni Kin and Clan" (1917), was challenged by most British social anthropologists, particularly W. H. R. Rivers and A. R. Radcliffe-Brown.

Language and Linguistics

Compared with some Boasian ethnographers, Kroeber contributed relatively little to linguistics. Yet he did field research on more than 2 dozen Californian languages, in many cases writing the first grammatical descriptions of these languages. Even more fundamental was his work on language classification in mapping and comprehending the relations of Native Californians. Between 1903 and 1919, Kroeber worked with Harvard's Roland B. Dixon to reduce the number of language families in the region, anticipating the continental classificatory work of Edward Sapir. Kroeber and Dixon were the first, in 1913, to identify the Hokan and Penutian families.

In his work on the speech of Zuni children and Yurok ritual oratory, Kroeber was an innovator in

the anthropological study of speech, as opposed to language. Toward the end of his life, he became interested in animal communication. Methodologically, Kroeber was an innovator in the ethnographic use of the wax cylinder machine to record speech and music, especially in using multiple cylinders to record lengthy narratives.

Kroeber's Legacy

Author of more than 500 publications, Alfred Kroeber dominated the field during the first half of the 20th century. As the last great generalist in American anthropology, he made important contributions to all aspects of the field except physical anthropology. In addition to his substantial theoretical and ethnographic contributions, he helped formulate the primary institutional structures of American anthropology.

In many ways, however, Alfred Kroeber is largely forgotten today. Although he is rarely cited by contemporary anthropologists, he has continued to influence anthropology in recent decades.

Kroeber's legacy in Native California was immense but controversial. As an ethnographer and generalist, his contribution to the study of California Indians is foundational. Yet he has been criticized for his perceived colonialist relationship with Ishi, his declaration that groups such as the Costanoan (Ohlone) and Gabrielino (Tongva) were extinct, his stress on the salience of wealth over religion among the Yurok, and his avoidance of genocide and culture change as historical factors. Yet one must note that this shift in his reputation is due to more general changes in intellectual and cultural climates, which were largely the result of his own work.

With Clark Wissler, Kroeber helped codify the culture area approach. Through his student Julian Steward, his concern with issues of the environment and regional patterning led to the development of cultural ecology.

In archaeology, his pioneering work in seriation is a foundation of the field in North America; his analyses of the pottery styles of Nasca, Peru, were later developed by his Berkeley colleague John H. Rowe and his students. In linguistics, beyond his formative contributions to Native California studies, his work on speech made him a forerunner of the ethnography of speaking developed by Dell Hymes. Kroeber's interest in historical questions and statistical methods made him a developer of the fields of glottochronology or lexicostatistics, which he had first explored in a 1907 paper on the Yokuts language.

Kroeber's work on comparative civilizations was an inspiration for the work of Robert Redfield and the development of area studies in academia. His work on cultural configurations influenced the art historian George Kubler's *The Shapes of Time* (1962). More recently, it has attracted attention among anthropologists and historians, most notably Eric Wolf's *Europe and the People Without History* (1982).

Kroeber's concept of the superorganic has been widely criticized as reification, and many regard his "descriptive integration" of concrete phenomena as overly particularist. In many ways, however, Kroeber was a forerunner of the recent development of cultural studies. Through his work on cultural theory with Clyde Kluckhohn, Kroeber was an inspiration for the interpretative anthropology of Clifford Geertz. His rooting of kinship in the development of language made him a precursor of what would become componential analysis and ethnosemantics. His kinship theory influenced David Schneider, and through him many modern students in gender studies.

Whatever the vicissitudes of historical reputations, Alfred Kroeber's leading role in the anthropology of his day will ensure his relevance to future generations.

Kuper, Hilda B.

Hilda Kuper (née Beemer; 1911–1982), Swazi ethnographer par excellence, critical colonial analyst, littérateur, and liberal political activist, belonged to a remarkable cohort of South African anthropologists that included Max Gluckman, Ellen Hellman, and Eileen Jensen Krige, who, inspired by Agnes Winifred Hoernle (affectionately known as the "mother of South African social anthropology"), all studied social anthropology at the same time at the University of the Witwatersrand.

Kuper was born to Jewish immigrants on August 23, 1911, in the Southern Rhodesian town of Bulawayo. The family moved to Johannesburg when her father died and Hilda, the youngest of five siblings, was six. Lack of financial resources was to be a major obstacle during her early career. She entered the University of the Witwatersrand in 1927, where, on a whim and encouraged by her school friend Max Gluckman, she enrolled in a yearlong social anthropology course taught by Hoernle, one of the leading liberals in South Africa. Hoernle had a profound effect on Kuper in how she interpreted the causes and effects of injustice, inequality, and cruelty. While Hoernle had worked closely with Radcliffe-Brown, she also grounded her students in European and American diffusionist approaches. The result was that Kuper was to see them as complementary to her own.

In the second and final year of the undergraduate social anthropology major, Hoernle went on a sabbatical and was replaced by Isaac Schapera, who took the class on a monthlong field trip to Botswana. After graduating in 1930, Kuper worked at the South African Institute of Race Relations, where she did a pioneering urban anthropological study examining the impact of the liquor prohibition on Africans and how women coped by developing voluntary organizations. Using a small inheritance, Kuper made her way to London, where from 1932 to 1934 she was a participant in Bronisław Malinowski's famous seminar at the London School of Economics and served as Malinowski's research assistant. Later, when she successfully applied for funds from the International Africa Institute to undertake fieldwork for her doctorate, one of her referees, Schapera, wrote that she "was extremely bright although temperamentally rather romantic." He thought so highly of her that he was encouraging her to study the "woman side of things" among the Tswana and had even proposed marriage to her to ensure this research. Although they didn't marry, this "romantic temperament" was to lead to one of Kuper's unique and pioneering contributions to anthropology, her experimenting with alternative ways of presenting data and insights.

Serendipitously, while in South Africa to address an international educational conference, Malinowski met the King of Swaziland, Sobhuza II, who invited him to visit his kingdom after the conference. Malinowski and his research assistant, Kuper, then spent 2 weeks there, regaled by the commissioner and the king, and the result was a lifelong commitment to the Swazi people stretching from 1934 to 1984. Sobhuza, who ruled Swaziland from 1921 to 1983, was Kuper's personal friend and confidante, and he appointed her his official biographer and awarded her Swazi citizenship.

Her 1936 marriage to the lawyer Leo Kuper (uncle to the anthropologist Adam Kuper) precipitated a crisis of sorts as her grant did not allow for married female researchers. Fortunately, the matter was resolved, and she completed her fieldwork and took a position as a senior lecturer at Wits University in Johannesburg from 1940 to 1947. During this time, she managed to write up her dissertation, which was published in two volumes

in 1947, *The Swazi: An African Aristocracy* and *The Uniform of Colour*. While the first volume was almost vintage Malinowskian, in the second volume Kuper broke away from the discipline's emphasis on "social control" and "culture contact" by combining an analysis of changing institutions with an implied critique of society. Her analysis of Swazi militarism, internal politics, the colonial state, and surrogate colonialism was revolutionary. It exposed the hypocrisy of the ruling White colonial elite, who owned more than two thirds of the land in the Swaziland Protectorate and who had tried to have her expelled from the Protectorate because of her liberal political views.

After the Second World War, a demobilized Leo Kuper decided to become a sociologist, and Hilda accompanied him to North Carolina and Birmingham (United Kingdom) for his studies before Leo accepted the Chair of Sociology at the University of Natal. Unable to secure a position in the anthropology department, Kuper obtained funding to do some 4 years' fieldwork on the Indian community in Natal, working with Sidney Kark, the pioneering community health exponent. The result was a landmark study, *Indian People in Natal* (1960), on immigrant communities. The Kupers became actively involved in the Gandhian passive resistance movement against apartheid in Durban and in the formation of the Liberal Party and courageously stood up to various forms of government intimidation and harassment.

Eventually, both Kupers accepted positions at the University of California, Los Angeles, where Hilda taught from 1963 until her retirement in 1977. There she made three major contributions to anthropology. She pioneered the study of biography in anthropology with her authorized biography of Sobhuza. More important, with Leo and her colleague M. G. Smith, she developed the intellectual underpinnings of the Plural Society approach to understanding complex and colonial societies. She also explored alternative ways of presenting ethnographic data and understanding through fiction. Her novel *The Bite of Hunger* (1965) and her play *A Witch in My Heart* (1970) are exemplars of intuitive communication of deep meanings that complement the knowledge of another culture gained by discursive scholarship.

Perhaps most intriguing about Kuper's legacy is her later realization that rather than the anthropologist exploiting colonial subjects, in her case, the Swazi elite skillfully used her and other progressive South Africans to adroitly and constantly invent myths and traditions in the interests of the hegemony of the Swazi royalty.

Labov, William

William Labov (1927–) is an American linguist best known for his central role in the foundation of modern sociolinguistics, and more specifically for an approach to the investigation of language in its social context known as *variationist sociolinguistics*. He rose to prominence in the 1960s as part of a broad movement in the social sciences to focus attention on language as a social phenomenon in fields like linguistics, anthropology, sociology, and philosophy of language. As such, Labov's work stands in dialogue with prominent anthropologists from that period, including Dell Hymes and John Gumperz, who share a focus on the complex relationship between language and society. What sets Labov apart is his end goal of developing a socially informed linguistic theory and his methods, which focus on the quantification of variables as a means to describing social stratification and linguistic change. He is currently one of America's most distinguished linguists, with a body of work spanning 50 years.

Labov grew up in Rutherford and then Fort Lee, New Jersey. Educated at Harvard (BA in 1948), he worked as an industrial chemist at the Union Ink Company (1949–1960), before returning to academia at Columbia (MA in 1963, PhD in 1964). There, he worked under the direction of Uriel Weinreich, a pioneer in the field of language contact and a scholar of Yiddish. Labov stayed on to teach at Columbia from 1964 to 1970. Since 1971, Labov has been a professor of linguistics at the University of Pennsylvania in Philadelphia, a city that has served as a laboratory for much of his research.

Diachronic Studies of Linguistic Behavior and Social Patterning

Labov broke from linguistic tradition, which in the 1960s was more and more dominated by Noam Chomsky and generative grammar, by rejecting the *idiolect* (the variety of language unique to an individual) as the primary object of study. Generative linguists considered language a property of the individual and thus relied on individual speaker data, often in the form of intuitions or grammaticality judgments. In direct contrast, Labov argued that language is a community property and that individuals' speech can only be understood relative to that of the *speech communities* they belong to. Speech communities are considered to share linguistic norms and to be the level at which linguistic patterning can be most clearly observed. Labov also called for a combination of the *synchronic* (studies of language at one point in time) and the *diachronic* (studies of change over time). This was in response to the emphasis on synchrony made by both the newer generative and the earlier structuralist traditions (the latter being well known in anthropology due to the influence of Claude Lévi-Strauss). Labov's suggestion was to move away from the exclusively synchronic study of abstract idiolects to consider the variation in communities of speakers and how these patterns of variation provide information about community change over time. In this, he updated traditions in dialectology, which had combined synchrony and

diachrony by collecting data in the field to answer largely historical questions. While European in origin, dialectology was compatible with an earlier American tradition of descriptive, anthropologically influenced linguistics, deriving from Edward Sapir and Franz Boas, who were well aware of the extent of linguistic diversity, if not necessarily of intracommunity variation.

Synchronically, Labov set out to demonstrate that linguistic behavior varies systematically according to the social patterning found in speech communities. His first study found that local attitudes toward island life on Martha's Vineyard (Massachusetts) were correlated with the pronunciation of certain vowels. He then demonstrated the social stratification of several features of the New York City dialect. In the famous Department Store Study, Labov visited three stores of differing social status (Klein's, Macy's, and Saks), and he found that the sales clerks had corresponding differences in their production of the *r*s in the phrase *fourth floor*. The main part of Labov's dissertation study was on the Lower East Side of Manhattan, where he recorded interviews with a random, socially stratified sample of the population. Published in 1966 (revised edition, 2006) as *The Social Stratification of English in New York City*, this work was more rigorous than dialectologists' previous attempts to observe variation in American English. It demonstrated that several features of pronunciation varied systematically with the social class of the speakers and also with the style of their speech, along a continuum from casual to formal. At the same time, Lower East Siders of all class backgrounds agreed in their negative evaluation of the local dialect. Labov argued that this was evidence that New Yorkers formed a single speech community, sharing norms for linguistic use as well as socially stratified patterns of production.

The variation present synchronically in New York City was further important, Labov argued, in that it related to diachronic change. For example, he found that for the upper middle class, the younger the speaker, the more likely the person was to pronounce the *r* after a vowel. Dismissing the alternative possibility of *age grading*—that is, that speakers use less postvocalic (*r*) as they age—Labov called this pattern *change in apparent time*: The synchronic variation between age-groups is a snapshot of a change in progress in the community. In addition, patterns showing individual speakers using more postvocalic (*r*) in more formal styles (where more attention would be paid to speech) and middle class speakers leading in their use of postvocalic (*r*) were both indicative of what Labov calls *change from above* (above the level of conscious awareness). In this case, the change from above involved the adoption of an external prestige standard where coda (*r*) was pronounced. The framework also includes *change from below*, which for Labov is a language- and community-internal process, involving changes that speakers are not consciously aware of. Change from below was exemplified in New York City by the raising of the vowel in *bad* toward *ey* (or even *ee*) and the vowel in *bought* toward *oo*.

Much of Labov's recent work pursues diachronic questions, including the three-volume *Principles of Linguistic Change* (1994, 2001, 2010), which acts as a compendium of variationist sociolinguistic work (including Labov's own studies of Philadelphia English), orienting it within the larger body of work seeking to understand the principles underlying language change.

Another major recent publication (with Sharon Ash and Charles Boberg) is the *Atlas of North American English* (2006), which presents an acoustic analysis of the dialects of the United States and Canada, delineating the boundaries of the major dialect regions and characterizing broad patterns of phonological change. Based on telephone fieldwork, this was the first dialect atlas to cover such a large region and to be based on instrumental measurements.

Labov aligns with the fields of dialectology and anthropology in his methodological contributions. He focuses on gathering naturalistic data, trying to observe the type of speech people use when unobserved. The most valuable speech to elicit for analysis he terms the *vernacular*, which refers to the most casual and systematic of an individual's speech styles. Labov pioneered a methodology known as the *sociolinguistic interview*, a face-to-face recorded session designed to elicit variation across contextual styles (from the vernacular to the very formal) in long stretches of naturalistic speech. The sociolinguistic interview provides the individual data that, when aggregated, is the primary evidence used in sociolinguistic analysis. Today, it is often used in combination with ethnographic observation, allowing researchers to bring both qualitative and

quantitative linguistic observations to bear on their research questions.

A Quantitative Approach to Data Analysis

Labov adopts a quantitative approach to data analysis. His concept of the *linguistic variable* refers broadly to a set of referentially equivalent variants (ways of "saying the same thing"). Defining the linguistic variable allows for variants to be systematically tracked and counted across stretches of speech. Labov's earliest work used tables and graphs to compare the percentages of use of variants such as the presence or absence of *r* in phrases like *fourth floor*, aggregated over stylistic contexts and/or social classes. The regular patterns revealed in such displays constituted the evidence for *orderly heterogeneity* and the social stratification of the speech community, revealing intricate order in place of what had been dismissed as chaotic *free variation* by structuralist and generative linguists.

Later developments by Labov and others enabled a more sophisticated approach to the quantitative analysis of language. Computer programs called *variable rule programs* (VARBRUL) were developed to estimate the social and linguistic contextual effects on many types of linguistic alternations "coded" from naturalistic data. For example, researchers could use a single data set to show that a variable like *t/d* deletion (e.g., saying "wes' coast" instead of "west coast") is favored by particular social groups (e.g., by men more than by women) as well as in particular linguistic environments (e.g., before a consonant, as in *lef' hand*, more than before a vowel, as in *lef' out*). Over the next decades, practitioners would rely on this type of quantitative estimation to compare and contrast VARBRUL parameters between different varieties of a language as well as for studying individual varieties. Although statistical tools other than VARBRUL are now used, sociolinguists build on Labov's early demonstrations that linguistic variation is not random but is governed by orderly quantitative principles.

Nonstandard Language Varieties: Beyond the Deficit Model

Labov has also had a major impact through his focus on the description and legitimization of nonstandard language varieties, most notably the variety currently known as African American English (AAE). In Harlem in the late 1960s, Labov directed a team of field-workers who conducted ethnographically informed group interviews with African American youth. In his 1972 book *Language in the Inner City*, Labov described the speech of his participants as linguistically structured and sociolinguistically patterned, reiterating his stance on the orderly heterogeneity of all linguistic systems. In the case of AAE, demonstrating its systematicity was crucial at the time, when popular theories like the *deficit hypothesis* posited that linguistic, cultural, or even genetic differences accounted for the poor performance of African American children in schools. The work of the sociologist Basil Bernstein on *restricted and elaborated codes* also contributed to the popular view—one that still holds today—that AAE is a poor or incomplete version of English and reflects a broader cultural deficit for African Americans. Labov has remained an activist throughout his career, working to bring insights from sociolinguistics to a broader audience, both academic and popular. He testified as an expert during the 1979 Ann Arbor trial, which established the precedent that the home language of Black children should be taken into account in public education. More recently, he has worked to develop tools for educators that draw on linguistic knowledge about nonstandard varieties like AAE and Latino English to improve the teaching of reading to minority students. Furthermore, his work has sparked a massive subdiscipline devoted to the study of AAE, large enough to be considered almost a separate branch of sociolinguistics.

Sociolinguistics remains heavily influenced by the variationist paradigm. While some approaches, including many qualitative subdisciplines like discourse analysis and interactional sociolinguistics, critique variationism's reliance on quantifiable data and its use of fixed macro-sociological categories, variationist sociolinguistics remains in dialogue with the broader field. The so-called third wave of variationist studies (developed by Penelope Eckert, herself a student of Labov's) proposes to extend and refine early variationism by retaining its use of empirical and quantifiable data while calling for a renewed focus on the individual, critiquing Labov's assertion that individuals are worthy of study only in the aggregate of speech communities. Eckert's focus on individual practice, style construction, and social meaning also differs from Labov's variationism in drawing on theoretical models from anthropology

and social theory, including indexicality (from Charles Sanders Peirce and more recently revived by Michael Silverstein), enregisterment (Asif Agha), and language ideologies (Paul Kroskrity, Bambi Schieffelin).

Labov's own focus on the social life of language is primarily intended to inform linguistic theory. Nevertheless, his work has had a major impact on, and retains substantial relevance for, those who work at the intersections of language use and social behavior, across many disciplines.

Lacan, Jacques

Jacques Lacan (1901–1981) was a French psychiatrist and psychoanalyst who had a deep influence on philosophy, literary theory, and anthropology. One way to describe the work of Lacan is as an anthropology—a theory of what it means to be human. According to Lacan, Sigmund Freud's greatest contribution was the invention of the unconscious and the emphasis he placed on sexuality, both of which were specific to humans. Unlike animals, governed by instincts, nature, and biology, humans were defined by desire and language, by their ability to symbolize. Human subjectivity was thus always a form of intersubjectivity in which the encounters with the social and the "Other" were key in the construction of the self.

Lacan's thought presents a number of intrinsic difficulties. On a historical level, Lacan insisted again and again on the fact that he was simply reading Freud, that all of his concepts were anchored in Freud's texts. Such a claim is problematic in light of the fundamentally divergent interpretations of Freud throughout the 20th century. If Lacan's writings found little echo in the United States or in Great Britain, they nonetheless radically shaped the field of French psychoanalysis. Whether one argued with or against him, Lacan became a necessary reference within the French context. Lacan's work is also extremely complex on a theoretical level. His notoriously dense prose, his opaque references, his frequent digressions, and his general refusal of any systematic presentation have led many scholars to misconstrue or to simply dismiss his thought. The difficulty of Lacan's style, however, must be understood within his larger philosophical enterprise, as an attempt to *perform* his theory, to put it into practice. How does one write when language is inherently unstable, when meanings shift constantly, when the signifiers and signified are simply connected by an arbitrary relation, and, most important, when the self who writes, the author, is never an autonomous, centered self?

Born in 1901 in a Parisian bourgeois Catholic family, Lacan studied medicine before choosing

to specialize in psychiatry in 1927. His interest in the question of madness and the psyche drew him toward surrealism, toward André Breton, Georges Bataille, and Salvador Dalí, who were some of the earliest readers of Freud in France. During those years, he decided to undergo analysis with Rudolph Loewenstein, one of the original founders of the Société Psychanalytique de Paris, which Lacan joined in 1934. In 1932, he defended his doctoral thesis, *On Paranoid Psychosis and Its Relations to the Personality*, in which he maintained that psychosis was not the outcome of a specific malfunctioning of the brain as many neuroscientists believed but rather the product of biological and cultural factors. The subject, he argued, was never isolated as many psychiatrists assumed. He or she was neither the autonomous reflexive Cartesian self nor the transcendental Kantian actor. Rather, Lacan's understanding of the self was closest to G. W. F. Hegel's.

Theory of the Mirror Stage

Lacan became particularly engaged with Hegel's thought through Alexandre Kojève's seminar on the *Phenomenology of the Spirit*, which he attended in the 1930s. Kojève's reading of Hegel emphasized the constitutive role of desire and of the "Other," who is both desired and the agent of desire and, consequently, of recognition. Hegel offered a way to bypass the divide between the individual and the social by suggesting that the two were neither autonomous nor overdetermined by one or the other but, rather, were mutually constitutive. Hegel's influence was particularly palpable in Lacan's theory of the "mirror stage," which he first presented at an International Psychoanalytic Association (IPA) congress in 1936 and which he reworked throughout his career. The mirror stage describes the reaction of a baby from 6 to 18 months, who, despite his lack of physical coordination, recognizes himself in a mirror. Although the child experiences his body as fragmented, the image he perceives is whole, integrated, and contained. This contrast produces a feeling of conflict and aggressiveness, which the child attempts to overcome by identifying with the image, which in itself leads to a sense of jubilation. For Lacan, the mirror stage describes the structure of subjectivity more generally: The unconscious, self-defined by the free play of the drives, identifies with an ideal I, the ego, the social self. This constitutive ambiguity in identity formation, this fundamental alienation, is absolutely central to Lacan's work: Identifications are based on self-recognitions that are always already misrecognitions. The mirror stage, as Lacan will later argue, also marks the subject's entry into language. There is an imaginary dimension to this double process of language acquisition and identity formation, resulting from the sense of mastery, autonomy, and wholeness. There is also, however, a symbolic element as the child looks up to the adult carrying him, the "Other," to confirm his identity.

Lacan reworked his concepts of the Imaginary, the Symbolic, and the Real in his 1953 IPA paper "The Function and Field of Speech and Language in Psychoanalysis," also known as the Rome Discourse. A few months before this presentation, Lacan had—along with other French psychoanalysts—resigned from the Société Psychanalytique de Paris to found the Société Française de Psychanalyse. The relationship between Lacan and the IPA had been contentious for a several years, particularly because of his practice of variable-length sessions, which could last from a few minutes to several hours. Lacan's Rome Discourse emerged in this context as a sort of theoretical manifesto for a new psychoanalysis, a new practice and a new theory, one increasingly influenced by structuralism. Language was the starting point of Lacan's "return to Freud," because language, the patient's word, or rather *parole*, was the only medium available to psychoanalysis. Lacan opposed his notion of language to that of the ego-psychologists or the behaviorist school interested in establishing "communication" with the patient. Psychoanalysis, he argued, ought to focus on the gaps in language, silences, paradoxes, symptoms, and dreams, even if they did not appear to communicate anything. The idea behind the variable-length sessions was precisely to revive the "talking cure" along Freud's guidelines, to provide a forum in which the unconscious, as opposed to the ego, could speak.

Theory of Language

According to Lacan, contemporary psychoanalysts had overlooked Freud's two most important innovations: (1) the unconscious and (2) sexuality. Both of these, he argued, had a linguistic expression and could only be studied in relation to language. Lacan's theory of language was indebted to structural

linguistics and particularly to the work of Ferdinand de Saussure and Roman Jakobson, who conceived of language as a system of differences. The second greatest influence for the Rome Discourse was the work of Claude Lévi-Strauss. From *The Elementary Structures of Kinship*, Lacan borrowed Lévi-Strauss's system of structural equivalence between subjectivity, the social, and language, all of which were mediated by the prohibition of incest. Indeed, according to Lévi-Strauss, the law or prohibition was productive rather than restrictive in the sense that it forced men to marry outside their clan, to establish new social relations, and to mediate this process through language. Lacan's notion of castration operated similarly: No object could ever fully satisfy desire, not even the mother or the child, but other "small objects" (*objets petit a* as opposed to the big "Other") could come into being. Although these *objets a* generate desire, they also remain unobtainable. The structural lack of the object—the impossibility of having the full thing, *das Ding*—was once again analogous to the structural inability to ever have a full, transparent, immediate language. Just as Lévi-Strauss suggested that man could never return to a state of nature—which was by definition always already foreclosed—Lacan indicated that man would never lead a purely instinctual existence.

Imaginary, Symbolic, and Real

The Imaginary, the Symbolic, and the Real—the three orders that Lacan would eventually represent in a Borromean knot to illustrate the mutual implication of the terms—were also defined in relation to castration and to language. The Imaginary, illustrated in the mirror stage, describes the identification of the ego and the specular image. As such, the Imaginary is the realm not only of synthesis, plenitude, duality, and autonomy but also of alienation and illusion. The Symbolic is always already implicated in the Imaginary as the image of the parent holding the child suggests. If the Imaginary is the realm of the signified, the Symbolic is the realm of the signifier, of the "Other," and of radical alterity. The law that regulates desire in the Oedipus complex or that mandates the prohibition of incest is also located in the Symbolic. In this context, Lacan also developed the notion of the *nom-du-père* ("name of the father"), based on the homophony *nom* as "name" and *non* as "no," to expand the role of the biological father in the Oedipus complex—as the one who breaks the dual identificatory relation between mother and child—to larger structures of authority (other people but also institutions such as the school, the army, and the law). Finally, the Real designates what escapes from both the Imaginary and the Symbolic, the undifferentiated, the traumatic, the impossible, that which cannot be expressed in language but always returns.

Later Work

In 1963, the Société Française de Psychanalyse finally received from the IPA the official recognition that it had sought for years, but under the condition of Lacan's exclusion. Following his "excommunication" from the IPA and the Société Française de Psychanalyse, Lacan founded the École Freudienne de Paris, where he continued to imagine new, unorthodox practices to prevent the reification of the psychoanalytic theory and experience. One of these was "the pass," in which analysts-in-training testified to their experiences of analysis before being allowed to practice themselves.

In 1966, Lacan published his only collection of written texts, *Écrits* (Writings). His main teaching during those years was oral, in the form of his seminar, first held at the Sainte Anne Hospital from 1953 to 1964, then at the École Normale Supérieure from 1964 to 1969, and finally at the Faculté de Droit until his death. It was at the École Normale Supérieure that Lacan acquired some of his most loyal disciples, many of whom were students of Louis Althusser and Maoist sympathizers. Among these was Jacques-Alain Miller, who eventually married Lacan's daughter, Judith, and was responsible for the posthumous publication of the seminars. After 1968, the University of Vincennes (Paris VIII) instituted the first official department of psychoanalysis, where many of Lacan's students taught and propagated his ideas. After the 1970s, Lacan was increasingly attracted to mathematics, logic, and formalization as a way to represent certain psychoanalytic concepts differently and to avoid impasses of the written word. In 1980, he singlehandedly dissolved the École Freudienne de Paris and constituted the École de la Cause Freudienne, over which he presided for a few months until his death in 1981.

Among other themes, Lacan continued to explore neurosis, perversion, and psychosis. While

Freud conceived of these categories phenomenologically, Lacan treated them as *structures* in which symptoms and behaviors may or may not be present. Furthermore, he defined all three around the modalities of avoiding or refusing castration: What does it mean to live as decentered subjects, with lack of objects for one's desire and with a language that always already fails? In neurosis, the solution to this dilemma takes the form of seduction. Perversion is the "demonstration" or repetitive staging of a scenario directed toward the production of a specific *jouissance*, an unbearable pleasure. In psychosis, it takes the form of delusion. Lacan was particularly interested in the structure of psychosis, which resulted, he argued, from the foreclosure of the signifier—a "hole" in the Symbolic due to the absence of the *nom-du-père*. The psychotic was unable to function in the social just as he or she was unable to "signify" linguistically or be understood.

Another important theme in Lacan's later work was the problem of sexual difference. As a psychic structure, sexual difference was reducible neither to sex (biological) or to gender (social). It escaped representation. Lacan, for instance, devised the concept of the phallus, a symbol of desire that was discursive rather than anatomical, as was the penis in Freud's work. Similarly, he devoted a seminar to feminine sexuality (Seminar XX: *Encore*) in which he made famous (and famously misunderstood) declarations such as "Woman does not exist" and "She is not-whole." These statements point once again to the structural impossibility of having or of being a complete object of someone's desire. Throughout his career, Lacan worked and reworked this anthropology, a theory of the decentered self.

Lafitau, Joseph-François

Father Joseph-François Lafitau (1681–1746) was a Jesuit missionary in Quebec from 1712 to 1717. Most of this time was spent in a settlement of Iroquois converts to Christianity at Sault St. Louis, near modern Montreal. Here, he conducted the methodical and meticulous ethnographic observations that were to form the core of his voluminous two-volume treatise *Customs of the American Savages Compared to the Customs of the Earliest Times* (1724). More than a century before Lewis Henry Morgan, he used his own detailed observation of the Iroquois along with comparable descriptions by other missionaries and secular travelers as well as the corpus of classical antiquity to elaborate an ambitious scheme of universal history. His ethnography, however impressive, was hardly unique, but the comparative scope of his inquiry was truly remarkable, foreshadowing anthropological thought in the following century.

For Lafitau, the "earliest times" referred to classical antiquity and the Bible. He accepted biblical chronology as a given—in his day an uncontroversial stance. His theology also committed him to a monogenetic vision of human origins, and consequently an explanation for the peopling of the New World. He seized on the fact that, like the Iroquois, the Lycians of Asia Minor, as described by Herodotus, were matrilineal, a condition he labeled "gynococracy." On these grounds, he conjectured that the Iroquois and other Native American peoples were descendants of Lycian migrants who had migrated across Asia and crossed over to the New World from Siberia.

Lafitau's theologically inspired vision of world history posited that, originally, all humanity had been granted divine instructions for living a proper

life but that only the "chosen people" had kept these intact. Nevertheless, the institutions of other peoples—especially religion, marriage and the family, and government—reflected, however imperfectly, the divine mandate. In his chapter on religion, the longest in the book, he attempts to reconstruct a sort of primal paganism by amalgamating features of Greek and Roman religion and accounts of Native American practices, not only of the Iroquois and their neighbors but also from accounts of Virginia, Brazil, and the Antilles. His portrayal was by no means unsympathetic. For example, he depicted pagan "mysteries"—initiation rites—as techniques for inculcating the practice of asceticism as a means of accessing the sacred, imperfect refractions of the divine spark. This section on religion is the one where he makes the least use of Iroquois ethnography.

The chapter on marriage is a far more straightforward account of Iroquois kinship. Here, Lafitau takes great pains to argue that Iroquois mores are in most respects consistent with Christian morality, lavishing praise on their marital fidelity and their systematic avoidance of marriages between relatives and only deploring the ease of divorce. Here and elsewhere, Lafitau saw no inconsistency between matrilineal kinship and the divine plan. This chapter contains an accurate explanation of Iroquois kinship terminology, earning the admiration of A. R. Radcliffe-Brown and Sol Tax, among others.

Other sections of the book leave theological concerns aside, providing a highly detailed account of Iroquois government, male and female occupations, warfare, foreign policy, trade, hunting and fishing, games, sickness and medicine, and burial and mourning, interspersed from time to time with comparisons with practices from classical antiquity.

Lafitau's work had virtually no impact on contemporary French secular Enlightenment thinkers, who had no interest in his theology and little patience with his pedantic style, especially in his discussions of classical antiquity. Voltaire lampooned his diffusionist account of the peopling of the New World. Just because the Greeks hunted, told myths, and danced on holidays and the Iroquois did likewise was hardly, he ironized, a compelling argument. Voltaire conveniently, if unfairly, omitted all reference to matrilineal descent, a far more striking coincidence. In fact, Lafitau's diffusionism, however erroneous, was hardly as careless as Voltaire suggested. Notably, Lafitau carefully considered and rejected on evidentiary grounds speculation that Native Americans were the long-lost Israelites.

Ultimately, Lafitau left a deeper mark on Scottish than on French Enlightenment thinkers. Adam Smith and Adam Ferguson relied on Lafitau, along with another Jesuit, Pierre de Charlevoix, a historian of New France, for their construct of "savagery" as the earliest stage of human progress. The Scots were particularly interested in Lafitau's descriptions of government and warfare, especially his analysis of how the Iroquois managed to maintain order, wage war, and engage in highly successful foreign diplomacy in the absence of a monarchy and indeed any central authority. Although, because of his description of Iroquois kinship, he has been retrospectively hailed as a precursor, his analysis of Iroquois government is arguably his most enduring contribution.

Lamphere, Louise

Louise Lamphere (1940–) is considered one of the "founding mothers" of feminist anthropology. Her career has encompassed Navajo studies, urban and workplace ethnography, family and kinship studies, U.S. immigration and ethnic group formation, and U.S. healthcare policy. She was among the first women to be hired for a permanent faculty position at Brown University but was denied tenure there in 1975. Always combining scholarship with activism and political engagement, she instituted a gender discrimination lawsuit, which was settled (in her favor) out of court and which had wide-ranging implications for women in higher education. She has served as president of the American Anthropological Association, the American Ethnological Society, and

the Association for Feminist Anthropology, among many other positions, and has received many honors and awards.

Since receiving her PhD from Harvard in 1968, Lamphere's scholarship has been characterized by a consistent emphasis on how subordinated individuals and groups construct strategies of resistance within specific, local political economies. Her theoretical contributions avoid the dichotomous thinking (between nature and culture, e.g., or structure and agency) so common in the social sciences, in favor of an emphasis on how practice emerges from structural conditions. Her body of work is often closely related to public policy initiatives and collapses the distinctions between applied, practicing, and public anthropology. Many of her research projects were conducted with interdisciplinary teams and employed the methodologies of historians and sociologists as well as anthropology.

Lamphere became nationally known as coeditor of a volume that helped define the field of feminist anthropology, *Woman, Culture, and Society*, published in 1974. Influenced by second-wave feminism and by the contributors' own experiences as women within the academy, the book originated with graduate students at Stanford in 1971. Lamphere was a young assistant professor at the time, and she undertook the organizing and editing duties with Michelle Zimblast Rosaldo. They explicitly defined their project as "a first generation's attempt to integrate an interest in women into a general theory of society and culture." Among the questions addressed by the contributors, and by the editors in their introduction were the following: Are women everywhere, as Simone de Beauvoir posited, the "second sex"? If so, can this universal secondary status be explained by biological factors? If not, and if gender hierarchies are historical constructs, how can they be changed? How is gender asymmetry related to other forms of stratification and domination? The ethnographic literature at the time relegated descriptive information on women largely to the topics of kinship and marriage, but there were suggestions that domestic tensions could have larger political implications. The contributors to *Women, Culture, and Society* were simultaneously trying to read an existing literature in new ways, supply ethnographic evidence that had gone previously unreported, and stretch the boundaries of existing theory, including Marxist historical materialism, British structural functionalism, and the emerging transactional political anthropology of authors such as Fredrik Barth and F. G. Bailey. Taken together, the essays represent an ambitious attempt to explain both variation and continuities in women's lives across time and space.

Within this collection, Lamphere's own contribution prefigures much of her later writing. Lamphere used her own ethnographic study of Navajo families, in dialogue with material from a range of other societies, to develop the idea that women's domestic strategies were shaped by very different sets of interests, even within the same household. At a time when evolutionary theories held that women were "naturally" competitive with each other (to attract and hold on to a male provider), Lamphere demonstrated that in situations where men and women share domestic authority, as among the Navajo, it was in women's interest to work together across kin groups and generations. Where women's household standing depended on their ability to covertly influence men, on the other hand, significant intrahousehold conflict was often generated between cowives or between the mother-in-law and daughter-in-law. The resulting domestic dramas were an outcome of social structure, not of women's "intrinsic" nature.

Lamphere explored similar themes in her dissertation fieldwork with Navajo communities in northern New Mexico in 1965–1966. Classic Navajo studies by Clyde Kluckhohn and George Collier had emphasized the negative psychological aspects of witchcraft and other beliefs; Lamphere was interested in mutual aid, cooperation, and reciprocity. Living with several different families in dispersed seasonal groups, she documented the overlapping networks through which religious ceremonies, family events, and other activities were organized and resources and labor were mobilized. Navajo conceptions of personal autonomy were often in tension with equally strong values placed on generosity and cooperation. Choices about whom to ask for help and decisions to grant or withhold assistance led Lamphere to important insights about Navajo kinship, the "loose" structure of which had defied analysis through the structural-functionalist models of the day.

Beginning in the mid-1970s, Lamphere undertook a series of large, multidisciplinary projects tracking the changing political economy of the United States, with a focus on how families made decisions about deploying labor within and outside

the home. In *From Working Daughters to Working Mothers* (1987), she traced the rise and fall of the New England textile industry, into which successive waves of immigrants sent first their unmarried daughters and later their wives and mothers, over the course of the 20th century. *Sunbelt Working Mothers*, published in 1993, examined the same process as American companies relocated from the northeast to the southwest, sparking significant changes in the household division of labor between husbands and wives, as fairly well-paid factory jobs for women became briefly available (before moving offshore by the end of the 20th century). The importance of ethnicity and immigration in both sites was further explored in two edited volumes, *Structuring Diversity: Ethnographic Perspectives on the New Immigration* (1992) and *Newcomers in the Workplace: Immigrants and the Restructuring of the U.S. Economy* (1994). As feminist anthropology developed into a vibrant and theoretically rich subfield within the discipline, Lamphere contributed another "state-of-the-art" edited volume, *Situated Lives: Gender and Culture in Everyday Life* (1997). Her commitment to documenting the ways working families adapt to the changing economic environment led her to medical anthropology and a major project on Medicaid managed-care initiatives in New Mexico, resulting in a special issue of *Medical Anthropology Quarterly* in 2005.

In 2007, Lamphere published a work bringing together her scholarly and personal history across 40 years, *Weaving Women's Lives: Three Generations in a Navajo Family*, in which she shares authorship with Eva Price, Carole Cadman, and Valerie Darwin, a grandmother, a mother, and a daughter of one of the families Lamphere lived with during her 1965–1966 doctoral fieldwork. The book traces the transformation in Navajo women's experience across the 20th century and incorporates Lamphere's own biography as a Westerner of a very different class and ethnic status. *Weaving Women's Lives* literally brings Lamphere full circle, drawing together her years of scholarship on questions of gender, ethnic identity, and economic change and their relationship to work in the United States.

L'Année Sociologique

L'Année Sociologique is a journal published annually in Paris: first from 1898 to 1907 and then at various intervals (see below) until the present day. The title followed a current fashion when it was founded: "The Year in (the area of knowledge)." The 1890s was a decade of rapid expansion of such journals in France, so in choosing this title, the founders were stating the arrival of their new discipline in the scientific world of the time. The current editors describe it as "the oldest scientific journal devoted to the social sciences."

The Group

The name is also applied to the group of French scholars who founded it and worked together on it in the early years, under the direction of Émile Durkheim, who is considered to be one of the three great founders of sociology (with Karl Marx and Max Weber). At that time, Durkheim was only 40 years old. He had already published three major works, *The Division of Labor in Society* (1893), *The Rules of Sociological Method* (1895), and *Suicide* (1897), and had visited scholars in Germany, notably the social psychologist Wilhelm Wundt. His masterwork *The Elementary Forms of Religious Life* was published much later, in 1912, so it was written with the benefit of many years of ongoing study, reflection, and engagement with the group and with the vast emerging new scholarship that they were reviewing for the journal and drawing on to define their own distinctive approach.

The efforts of Durkheim and his followers bore remarkable fruit, in part due to the brilliance of the work itself and in part due to the commitment of the members. Those mentioned on the face page in 1898 were Durkheim and 12 others, of whom 3 were at other universities. A whole new generation of young people are mentioned by name for Volume 7, and there was another surge in growth in 1912. By Volume 10, there were 20 members. For Volume 12, there were 29, from 10 universities. This growth was perhaps due to Durkheim's move from Bordeaux to Paris, where he gained an appointment in 1902. By the time of Volume 12, he was established in Paris and was a major intellectual figure in the capital. Membership in the group was markedly consistent over this time. Besides Durkheim, 7 of the first participants were listed for all 12 prewar volumes: Celestin Bouglé, Emmanuel Lévy, Paul Fauconnet, Henri Hubert, Marcel Mauss, Dominique Parodi, and François Simiand.

Durkheim's nephew Mauss was the other universally recognized scholar who belonged to the group from the beginning. He contributed disproportionately to the review essays and revived the journal in the 1920s, after Durkheim's death and the losses of the First World War. Mauss summarized and characterized their work in his moving eulogy in the edition of 1923–1924. Through what he referred to as a "true sharing of work," the collaboration of the *Année Sociologique* scholars not only provided the foundation for an entire school of the new discipline of sociology, with its own links throughout European scholarship, but also fostered what he referred to as a "flowering" of the varied individual work of its members.

The Journal Format

For the first 10 issues, the journal comprised two sections: (1) original memoirs and (2) review articles. The memoirs established the most notable themes of what became known as the "French school": religious practices in society (systems of classification, sacrifice, magic, caste, and representations of death); the division of labor, law, penal practices, and property; and general theoretical issues of social reproduction and comparative analysis. The original memoirs of the first edition were by Durkheim and Georg Simmel. Durkheim had essays of his own in 5 of the first 12 editions (up to 1912); Mauss authored or coauthored 4 editions, and Robert Hertz and Hubert authored or coauthored 1 each. The pervasive theme was society as a moral order.

The reviews were composed individually or in small teams, and the scholarship addressed in the reviews was wide-ranging and voluminous. In Volume 6 (1901–1902) alone, the 15 group members reviewed about 250 works, in more than 50 titled review sections, covering French-, English-, German-, and Italian-language scholarship. An example is one 16-page section titled Philosophical Sociology, where Mauss reviewed works by 15 anthropologists, written in French, English, and German, on religious and totemic systems all over the world, most especially in Melanesia, Central Africa, and Native America. This would be the basis for the seminal essay by Durkheim and Mauss on "primitive classification" published in 1903 (see later). Also included in this one issue were books and articles by famous scholars including Gabriel Tarde, Franz Boas, Benedetto Croce, Georges Sorel, Werner Sombart, James G. Frazer, A. L. Kroeber, and others.

For Volume 11, Durkheim decided to change strategy, to publish the memoirs more fully as a separate series, so that the members could devote more time to their individual research. The journal was then devoted only to review articles, and its frequency was reduced from the annual issue to one edition every 3 years, without, however, changing the name. Only two issues—Volumes 11 and 12—were published in this form, before the First World War brought everything to a halt. The war had a devastating effect. Several young members of the *Année Sociologique* group were killed, including Durkheim's only son, André. Durkheim died 2 years after his son's death, in 1917. The journal and the group were relaunched only in 1925 (edition for 1923–1924), under the leadership of Mauss, whose famous "Essai sur le Don: Forme et Raison de l'Échange dans les Sociétés Archaïques" (Essay on the Gift: The Form and Reason of Exchange in Archaic Societies) was the original research paper for that issue. The turbulence and loss in membership was much more marked than any variability of theory and vision in the group.

Mauss picked up "the task" left by "our dead," although the journal never regained the international stature it had achieved when Durkheim was alive. This would be impossible, since the first 10 volumes

are identified as groundbreaking in the history of the social sciences.

Theory and Method

The memoirs of the first 12 volumes indicate the theoretical and methodological innovations that the group proposed and that have become identified with the thrust of their enormous influence. Some of those titles are the following:

Durkheim: "The Prohibition of Incest and Its Origins"

Simmel: "How Social Forms Maintain Themselves"

Durkheim: "On the Definition of Religious Phenomena"

Hubert and Mauss: "Essay on the Nature and Function of Sacrifice"

Durkheim and Mauss: "On Some Primitive Forms of Classification: Contribution to the Study of Collective Representations"

Bouglé: "General Review of Recent Theories of the Division of Labor"

Hubert and Mauss: "Outline of a General Theory of Magic"

Paul Huvelin: "Magic and Individual Right"

Hertz: "Contribution to the Collective Representation of Death"

Bouglé: "Note on Law and Caste in India"

These titles convey the theoretical themes and the favored method of the school. The themes center on religion and meaning, on the one hand, and on what they called "social morphology" and law, on the other. The method is rigorously empirical. Case studies and ethnography figure prominently, and they cover the world: Australia, India, France, Native America, and the Arctic. The review section covers an even wider geographical world. Integrating the two themes, several articles aim toward a "general theory" of, or at least an approach to, specific phenomena such as magic, death, religion, words, and collective representations. They insert a characteristic method of comparison here: the detailed study of signal cases, elementary forms, or specific instances of general phenomena in which the qualities they see as central are particularly evident. Although they sometimes refer to these elementary forms as "primitive," they do not embed the argument in evolutionary theory. Rather, the adjective *primitive* refers at once to a condensed, generative "first" (as in "basic") as well as "ancient." Mauss, in particular, was deeply opposed to speculative history and in favor of identifying consonances and overlaps among phenomena from all places and eras of history, to elucidate their commonalities. This is his method in the most celebrated of all the memoirs published in the journal, the "Essay on the Gift" (1925), where he starts at two ends of the world, with the Icelandic Edda epic and the Maori *hau* ("spirit of the gift"), and ends with the civic life of his own time in postwar Europe, by way of Melanesia, Ancient Rome, and India, and stretching to include institutions such as sacrifice, which broadens the very definition of "gift."

The early theoretical articles make the links explicit between the two broad themes of religion and society and draw on the ethnographic sources to make the case. Over the years, the headings for the review sections reflect the growing breadth of their reach and the focus of their analysis. Each group of reviews is broken down into subthemes as well, where the specialist reader may pick up threads across the years. By Volume 6 (1901–1902), the major headings are as follows: General Sociology, Religious Sociology, Moral and Juridical Sociology, Sociology of Crime and Moral Statistics, Economic Sociology, Social Morphology, and, finally, Diverse, which included Art and Socialism.

From the early years, out of all the general theoretical papers, the one by Durkheim and Mauss together, originally published in Volume 6 of *Année Sociologique* as *De quelques formes primitives de classification* (1903) and translated into English as *Primitive Classification* (1963), best exemplifies their method and showcases their most inspired contributions. Here, the authors argue clearly for holding aside psychology and philosophy from the study of "mental operations," in favor of a rigorous, empirically based linking of the categories of classification of the world to the classifications of human society. In "Primitive Classification" (1963), Durkheim and Mauss focus on the signal case of totemism, the widespread practice of identifying a social group with a natural species with which they maintain an active relationship of some sort (avoid eating, wear as a talisman, perform in ritual, etc.).

The social groupings of our social past and "distant present" are still "the very cadre of all classification . . . the ensemble of mental habits by virtue of which we conceive things and facts in the form of coordinated or hierarchized groups" (p. 88). Durkheim and Mauss conclude that phenomena such as totemism demonstrate how sociology can shed light on the beginning and functions of logical operations. These are arguments taken up by a long genealogy of intellectual heirs, including Claude Lévi-Strauss in his magnum opus, his four-volume work on the logic of myth.

Although the work of *L'Année Sociologique* is sometimes represented in a schematic way, as positing the social foundations of cognitive categories and moral thought, the school's propositions emerged from a matrix of vast study, ongoing interchange, and the interweaving of individual, collaborative, and team work by more than a dozen scholars over a dozen issues of a journal, each of which ran to more than 600 pages. Collectively, they created a profoundly researched, empirically supported, and philosophically sophisticated body of work, encompassing societies ancient and modern, across the world. By encompassing all societies, they created a basis for general theory, comparative sociology, and a bridge between the two disciplines of anthropology and sociology that did not exist for those who divided the social world into industrial and preindustrial societies, East and West, literate and nonliterate.

Translation

It is largely through British social anthropology that the journal's essays moved into wide circulation in English-speaking scholarship. Translations were organized by E. E. Evans-Pritchard, professor of anthropology at Oxford, who met Mauss before he died in 1950. In the 1950s and 1960s, several of Mauss's authored and coauthored memoirs from the journal were published in English as short books: *The General Theory of Magic* (1950), *The Essay on the Gift* (1954), *Death and the Right Hand* (Hertz, 1960), *Primitive Classification* (Durkheim & Mauss, 1963), and *Sacrifice* (Hubert & Mauss, 1964). These works are still widely studied, as Mauss's work gains in influence: through the compelling relevance of the ideas, through the continuation of the journal, and through the Paris-based network that bears his name as an acronym, Le Mouvement Anti-Utilitariste dans les Sciences Sociales (MAUSS).

Latour, Bruno

Bruno Latour (1947–) is a French sociologist, philosopher, Bible scholar, anthropologist, and scientist; one of the founders of actor-network theory; and among the most unconventional thinkers of the past century. With his creative approaches to the collective production of knowledge, technology, metaphysics, and ecology, his work not only transcended the boundary between social and natural sciences but also provided a defining impulse to the discourse on the interaction of society, knowledge, and time in a world that, in his view, was never "modern." Latour is one of the most cited authors in the social sciences.

Biography and Major Works

Latour was born on June 22, 1947, in Beaune (Burgundy, France), into a wine-growing family steeped in tradition. His ideas stem from a classical Jesuit education and a comprehensive philosophical training. Even though he is now widely seen as a historian of science and a sociologist of technology, his early influences came from ancient mythologies and his enthusiasm for Friedrich Nietzsche. He felt highly attracted to the well-grounded epistemic attempts to grasp the essence of "Being."

Following his studies in philosophy, biblical exegesis, and anthropology in Dijon, Latour completed his voluntary military service (1973–1975) with the Office de la Recherche Scientifique et Technique

Outre-Mer in Abidjan, Côte d'Ivoire, where he wrote an ethnographic study on the ideology of "competence" in industrial relations and associated racist discourses. In 1975, he undertook doctorate studies at the Tours University.

Anthropology Beyond the Tropes: Laboratory Life, Science Studies, and Actor-Network Theory

In the late 1970s, Latour shifted from his anthropological research to focus on studying highly sophisticated scientific laboratories. He spent 2 years (1975–1977) in the Salk Institute for Biological Studies in San Diego, California, in the neuroendocrinology research lab of Roger Guillemin (who was later awarded the Nobel Prize), where he pioneered an ethnographic study of the scientific community, focusing on the processes of scientific discovery. The product of this fieldwork was *Laboratory Life: The Social Construction of Scientific Facts*, published in 1979, coauthored with the British sociologist Steve Woolgar. Through this work, Latour and Woolgar attempted to illuminate the roles of rhetorical strategies, technical artifacts, and discipline-specific research procedures in the construction of scientific "facts." For Latour, knowledge, be it technical skills, scientific theories, worldviews, or anything else, has no absolute certainty. Rather, it is merely a specific kind of familiarity in interaction with certain people, things, places, or events.

After his fieldwork in Côte d'Ivoire and California, Latour participated in a scientific-historical research project on the significance of Louis Pasteur for medicine and for French society (1978–1981). A summary of his findings was published in 1984 as *Les Microbes: Guerre et Paix: Suivi de Irréductions* (*The Pasteurization of France*, 1988). In 1987, he obtained his postdoctoral degree (*habilitation*) from École des Hautes Études en Sciences Sociales and published *Science in Action: How to Follow Scientists and Engineers Through Society.*

Nous n'avons jamais été modernes, or "we have never been modern," is perhaps Latour's most eye-catching aphorism. Latour revealed the dichotomy between nature and society, and object and subject, as useless, replacing them with concepts like "collective" or "human and non-human actors and actants." Latour shows how even the smallest (e.g., microbes) and seemingly unimportant, placid, and presumably lifeless things, such as keys or automobile safety belts, possess their own personal expressivity and action potentials and thus actively influence human lives. Within this reality-constitutive interplay of the most diverse forces, he presented the concept of "labor" as the quintessential social *topos*.

As a participant in numerous projects in political science and in research management, Latour has peered carefully over the shoulders of scientists and engineers. He developed all his epistemological thoughts and hypotheses on the basis of empirical studies (as exemplified in *Laboratory Life: The Social Construction of Scientific Facts* and *Aramis, ou l'Amour des Technique* [*Aramis, or the Love of Technology*]), through which he provided the crucial momentum for the development of new international and interdisciplinary research subjects, for instance, science and technology studies (STS or, in short, science studies), dedicated to the examination of the history of science and technological research.

Within the scope of science studies, he first employed poststructuralist, postmodern ideas to show that the knowledge produced by the sciences is not objective. Such knowledge is socioculturally constructed—that is, influenced by the prevailing cultural assumptions, ideologies, and power structures. But additionally, he criticized poststructural thinkers such as Roland Barthes, Jean Baudrillard, Jacques Derrida, Jacques Lacan, and Jean-François Lyotard. Jürgen Habermas and Pierre Bourdieu are also among his intellectual antagonists. Latour transcends social constructivism by arguing that reality is not mainly constructed but is set up by all the interacting and interrelated human and nonhuman protagonists at large. Latour assumes that technology, matter, nature, culture, and the social do not influence one another one-sidedly in their diverse features and domains. Rather, they are mutually dependent and interfused. In *La Clef du Berlin* (The Berlin Key, 1993), Latour used the "Berlin key" as an analogy to show that the artificial separation between society and technology is not sustainable.

In collaboration with other sociologists, specifically Michel Callon and John Law, he developed actor-network theory, a bundle of theoretical conceptions and qualitative methodologies for the examination of the processes of knowledge building in science, laboratory studies, and technology (*Reassembling the Social, an Introduction to Actor-Network-Theory*, 2005).

Latour and the Science Wars

In the 1990s, Latour became involved in the burning dispute between the humanities and natural sciences, popularly known as the Science Wars. The impetus for the scientific wars was a growing trend in the humanities to make use of physics or mathematical terms and formulas to clarify their arguments. The natural sciences raised a defense against this "infringement," and it came to an indignant cross-border fight between scientific warriors strongly tethered to their respective disciplines. In 1996, the physicist Alan Sokal parodied postmodernism by submitting a carefully crafted essay that he considered nonsense to the journal *Social Text*, which published it. Sokal critiqued the logic of postmodernists including Lacan, Baudrillard, Gilles Deleuze, Julia Kristeva, and Louis Althusser, and he attacked Latour, accusing him of irrationalism and philosophical mystification of his own social scientific approach in exploring the scientific procedures employed by the natural sciences. After Sokal and the physicist Jean Bricmont published *Impostures Intellectuelles* (Intellectual Impostures) in 1997, Latour reacted with his collected essays, *Pandora's Hope: Essays on the Reality of Science Studies* (1999), in which he addressed anew the consequences of scientific wars and renewed his antimodernistic credo, calling for flexibility, dynamism, and openness to cooperation across different scientific disciplines.

Willful Things, Politics-Capable Ecology, and the Power of Images

With *Politiques de la Nature: Comment Faire Entrer les Sciences en Démocratie* (*Politics of Nature: How to Bring the Sciences Into Democracy*), Latour, in 2004, broke new ground and not only delivered a stimulating analysis of the political philosophy of ecological movements but also renewed his call for a politically competent ecology. He provided an examination of the concepts of politics, ecology, and nature and decoupled each from the others. He separated ecology from nature, and to avoid conflict, he differentiated between ecology and economics. He proposed that nature should have a political representation consisting of humans and all other living things, such as animals and other presumably "dead" things. The new Parliament of Things that should legislate over the ecological economy, as Latour both playfully and earnestly referred to it, must first produce a new constitution that will resolve the remaining dichotomy between democracy and science. Latour, together with Peter Weibel, co-curated the 2002 international exhibition: *Iconoclash: Beyond the Image Wars in Science, Religion, and Art*. In 2005, they curated *Making Things Public. The Atmospheres of Democracy* at the Center for Art and Media Technology in Karlsruhe, Germany, and coauthored the accompanying catalog. Through *Iconoclash*, Weibel and Latour displayed a very prominent ambivalence visible in contemporary religion, science, and art: the ambivalence between iconoclastic and iconophilic attitudes, between the condemnation and admiration of the omnipresence of images—two positions that fight against one another but nevertheless need each other to exist through reciprocal opposition.

Gaia, Factish Gods, and Different Modes of Existence

In addition to his comprehensive publication and lectures on the interaction of society, science, and technology, Latour also examined the consequences of the passive presence of technology to our belief systems and religious expressions (*Jubiler ou les Tourments de la Parole Religieuse* [Glee or the Torments of Religious Speech], 2002, and *On the Modern Cult of the Factish Gods*, 2010).

In 2013, Latour delivered the Gifford lectures in Edinburgh. His lectures focused on the concept of Gaia, a complex mixture of mythical, spiritual, and scientific ideas about the nature of our planet Earth, as well as on "natural religion," a concept that in itself already consists of two highly disputed terms: nature and religion. Latour advances a secularized examination of nature, the sciences, religion, and related collective healing rituals. And he proposes a well-grounded inquiry into the supernatural.

Since 2011, Latour has been working with AIME (An Inquiry Into Modes of Existence), a project of the European Union, examining the metaphysics of different forms of existence. In the context of this project, he has developed a full-scale collaborative digital platform.

To date, Latour has written 15 monographs (translated into many languages), produced collected works (together with Callon and Pierre Lemonnier, among others), created sensitive portraits of thinkers such as Michel Serres and François Ewald based on

extensive interviews with them, and written numerous essays in scientific journals and many short texts, such as reviews and newspaper articles. In 1998, he published with Emilie Hermant a photo-essay on the technical and social aspects of the city of Paris. He has created performances, written theater pieces, and curated exhibitions. He has provided responses to numerous in-depth interviews, and his own works and thoughts have been the subjects of many other monographs.

Teaching

From 1982 to 2006, Latour taught at the Centre de Sociologie de l'Innovation and the École Nationale Supérieure des Mines in Paris and was a visiting professor at the University of California in San Diego, the London School of Economics, and the History of Science department, Harvard University. Since 2007, Bruno has been a professor at Sciences Po (Institut d'Études Politiques de Paris), where until 2012 he directed scientific research. He set up a media lab at Sciences Po to experimentally explore the opportunities offered to social theory through the spread of digital methods, and with Valrie Pihet, he created a new experimental program in art and politics.

Awards

Since 1992, Bruno has continued to be recognized with numerous prizes, honors, and honorary doctorate degrees (University of Lund, Sweden; University of Lausanne, Switzerland; University of Montreal, Quebec, Canada; University of Goteborg, Sweden; and University of Warwick, United Kingdom). In 2008, he received the Siegfried-Unseld Prize for scientific and literary accomplishments. He was the 2010 recipient of the *Kulturpreis* (Culture Prize) from the Society of the University of Munich.

Critical Contributions Within the Scientific Landscape

Latour is known as a lateral and pioneering thinker. The world that he envisages is one with its own will—one that has not really allowed itself to be tamed by the determining grip of a seemingly modern and rationally guided humanity. It is a world that emanates from the interaction of the temporarily controlled knowledge and experiences of actors and actants, be they artifacts, gods, humans, stars, electrons, technology, labor, market, mythologies, ideas, norms, things, or events. According to Latour, reality is not absolute, less so is its synonym, truth. Latour contends that even when the result of the interactions among humans and instruments cannot be calculated, the processes involved are completely empirically observable and can be closely grasped in a sort of "thick description" from a social scientific perspective. With the expansion of his examinations into areas of interest previously excluded from academic fields, Latour reveals historical totalizations and shortages in the sciences. By this, he opens our view to a new realism, one that is not naturalistic but that investigates the vitality of perceptible and tangible things—a vitality that is unconventionally independent and dynamic.

Latour's thinking and methodology connect him with those of Deleuze, Peter Sloterdijk, and Tarde; with Martin Heidegger's phenomenology; and with the philosophy of American pragmatism in the style of John Dewey, William James, and Richard Rorty.

Expansion instead of reduction, acceptance of many perspectives in place of totalization, and inclusion instead of exclusion, these are the themes that run prominently throughout Latour's works. The goal of a modern science, from Latour's perspective, can be neither the taming of nature or society nor the persistence of orthodox epistemologies. In contrast, it must derive from collaboration with the environment and public discourses and must be continuously renewed by the sparks emanating from this interaction. Modern science must fit contemporary needs to prove the relevance of its content and not appear like a mechanical toy that performs the same routine endlessly, while all that surrounds it has long since changed. This is Latour's unmistakable demand and hope. The hope for the success of a transformed science that is conscious of the complex interdependence of knowledge, politics, the public, technology, economic necessity, an endless labyrinth of intermediaries (social networks), and the urgency of interdisciplinary convergence.

Leach, Edmund

Edmund Ronald Leach (1910–1989) was one of the most emphatic and colorful figures in modern social anthropology. He spent much of his time writing for and speaking to lay audiences and so became perhaps the most widely known British anthropologist of his generation. Writing on an improbably vast range of topics, between 1937 and 1988, Leach published nine books, four edited volumes, more than 50 scholarly articles, and hundreds of shorter pieces. Although he is remembered primarily as the Anglophone purveyor of Claude Lévi-Strauss's structuralism, his intellectual achievement does not align with any one theory. He founded no "school," constructed no theoretical systems, and was impatient with theoretical assertions. Leach's assaults on established theories provoked charges of inconsistency from his colleagues, but his intellectual restlessness was far from the petulant belligerence of which he was often accused. Rather, it expressed a steady vision of social anthropology, which he maintained throughout his life. For Leach, unsettling old dogmas was not a matter of settling into new ones but of challenging intellectual habits. He saw anthropology's subject matter not as a set of theoretical edifices but as other worlds of human action and thought, there to be understood.

Early Life and Introduction to Anthropology

Leach was born on November 7, 1910, in Sidmouth, a town in Devon, into a large and densely intermarried family of Lancashire mill owners, to William Edmund Leach and his wife Mildred (née Brierley). At the time he was born, the family fortunes came from a sugar plantation and a sugar-refining factory in northern Argentina. Leach grew up in Rochdale; studied at Marlborough College, a public school, which he entered as the twenty-first Leach; and was later admitted to Clare College, Cambridge. Like most anthropologists of his generation, he had no initial training in the discipline, and at Cambridge, he read mathematics and engineering. On graduating with a first class BA in 1932, he joined a British trading firm, John Swire and Sons (later Butterfield and Swire), with operations in East Asia, and was posted to China. He spent more than 3 years living in Hong Kong, Shanghai, Chunking, Tsingtao, and Beijing, all the while traveling a great deal. In China, Leach was struck by an extraordinary fact: Here was a great, ancient, and wholly viable civilization in which everything was, as Leach liked to say, "back to front." Chinese religion, architecture, clothing, ritual, cuisine, and art offered solutions to universal human problems and seemed to invert comprehensively the ways things were thought of and done in the West. While traveling all over China, Leach wrote swathes of letters and detailed notes on the local customs, religion, and (especially) technology.

By 1936, he had grown weary of commerce. Instead of renewing his contract, he followed a spur of the moment call by an expatriate American psychiatrist, former Mormon missionary, and amateur anthropologist, Kilton Stewart (whom Leach had met in Beijing), to visit "Bottle the Bugger"—that is, the island of Botel Tobago (now Langu) off the coast of Taiwan. Having spent 8 weeks on the island, he

wrote voluminously about his observations, drew sketches, and took many photographs of the native Yami, the first "real primitives" he encountered close-up. On his return to England, Leach was introduced by a childhood friend, Rosemary Upcott, to her husband, the anthropologist Raymond Firth, and through him to Bronisław Malinowski, the leading grandee in British social anthropology at the time. Malinowski was a big, forceful, and tremendously charismatic man, who presided unchallenged from his chair at the London School of Economics over the entire discipline in Britain. Malinowski was a pioneer of extended fieldwork as anthropology's central method and of "functionalism" as its theoretical stance, which was maintained in British anthropology well into the 1950s. When Leach went to the London School of Economics as a student of anthropology, he joined Malinoswki's legendary seminars, which he ran between 1924 and 1938. These salon-like meetings, which brought together a motley gathering of anthropologists, psychologists, sociologists, philosophers, missionaries, and colonial administrators from around the world, were the nursery for much of that generation of British anthropology. Participants included the anthropologists Isaac Schapera, Audrey Richards, S. F. Nadel, Meyer Fortes, M. N. Srinivas, and E. E. Evans-Pritchard, as well as Leach's mentor and immediate teacher, Raymond Firth. Here, Leach met Noël Stevenson, a colonial administrator in Burma, through whom he came to do fieldwork in the Kachin Hills of northeastern Burma (following an abortive spell among the Rowanduz Kurds in Pakistan in 1938).

Contributions to Anthropology

During the 6 years (1939–1945) Leach spent in Burma, he conducted extensive fieldwork, served in the Burmese Rifles (reaching the rank of Major), raised a force of Kachin irregulars, got married (to Celia Buckmaster), and had his first child, Louisa. On the basis of his researches, he published his first professional monograph, *The Political Systems of Highland Burma* (1954), which is now widely regarded as his most enduring book and a momentous contribution to political anthropology. His key breakaway assertion was that the notion of a bounded "tribe" with its own language and culture was useless for understanding the Burmese highlands. Instead, he argued, the social landscape of the Kachin Hills comprised a shared system of social and political relations, in which clans segmented and allied themselves to one another via marriage and identity codes such as dialect and dress. This "system" was neither stable nor closed, as people constantly entered, left, and shifted their position within it. The changes were made possible by three ideal political models that actors had at their disposal: (1) the hierarchical *gumsa*, (2) the anarchic egalitarian *gumlao*, and (3) the Shan state system of the neighboring valleys. Ambitious persons seeking political and economic advantage employed these models strategically to justify their actions, and the accumulated weight of their decisions tilted polities this way or that, shifting the whole structure of local society over time.

This was trailblazing work, far ahead of its time. By dissolving the old ethnographic notion of tribe as an isolated totality, Leach dissented from the persistent habit in anthropology of treating village, tribal, national, or any other communities as islands unto themselves, rather than as constituents of broader relational schemes. This insight informed, for instance, his student Fredrik Barth's celebrated thesis (1969) that ethnic groups were not cultural isolates but relational entities defined vis-à-vis one another. Leach's stress on a broad regional approach also anticipated work done by anthropologists in the 1970s under the rubric of "political economy." His emphasis on the flux inherent in social systems and on changes in societies over time was radical in the age of functionalism, in which anthropologists generally described societies as existing in a state of static, ahistorical equilibrium. His insistence that societies were made and unmade by human action and interaction also prefigured criticisms of social stasis leveled at functionalist-structural anthropology by "practice theorists" from the late 1970s.

Leach pursued the two concerns central to *Political Systems*—the relationship between social structure and individual agency (Malinowski's legacy) and between ideology and the material conditions of life—through much of the rest of his career. One set of responses to these concerns appeared in *Pul Eliya, a Village in Ceylon* (1961), his next monograph based on fieldwork conducted in Ceylon (Sri Lanka) in 1954. Here, he argued that kinship was "not a thing in itself," a concrete organization for anthropologists to study, but an idiom for speaking about property relations, used to pursue

the pragmatic, material goals of political actors. *Pul Eliya* has been criticized for Leach's unquestioning adoption of the economically motivated, self-maximizing individual and for the reduction of culture to a residual consequence of paddy cultivation. The monograph, nevertheless, developed the theoretical coup that Leach launched in *Political Systems* and for which he is still mainly remembered today. One of the book's central assertions is that the local "subcastes" (*vaigas*) were not discrete groups bound by blood and descent; divisions between them were important not because they formed social enclosures but because they constituted the basis for conflictual or cooperative affinity. The implications of this, seemingly minor, ethnographic quibble were pivotal. As in *Political Systems*, here Leach was challenging the prevailing functionalist picture of societies as separate, self-sufficiently functioning organisms to be labeled and typologized by anthropologists, an exercise he derided as "butterfly collecting."

The year 1961, when *Pul Eliya* was published, was a watershed year in Leach's career. This was when he issued a collection of essays, *Rethinking Anthropology*, in which he departed drastically from his teachers' functionalism, urging anthropologists to abandon their taxonomies of cultural systems in favor of organizing the ideas that underlie patterns of action and thought in societies. This turn was accelerated by two felicitous encounters, one with the polymath-anthropologist Gregory Bateson and the other with the linguist Roman Jakobson, both of whom he met while working at the Center for Advanced Studies in the Behavioral Sciences at Palo Alto, California (1960/1961). Bateson and Jakobson were developing, in their own different ways, the means to understand systems of relations. Leach was particularly struck by the work of Jakobson, one of the most important linguists of the 20th century and a pioneer of structural linguistics. Jakobson's analysis of sound systems hinged on the pivotal proposition that meaningful sound units (phonemes) in a language did not exist in isolation but were necessarily defined relative to one another. The sounds /t/ and /d/, for instance, are separate phonemes in the English language because its speakers perceive the difference undetectable to speakers of Korean, in which they together constitute a single phoneme. So the smallest units of language could be identified only in contrast to others and were not freestanding but were fundamentally relational entities. Jakobson went on to analyze syntax, morphology, and even poetry, music, and cinema just as he analyzed sounds, by identifying elements in a system through relational opposing pairs. His work was the primary inspiration for the anthropologist Claude Lévi-Strauss, considered the father of "structuralism" in anthropology.

Leach remembered that when he first encountered Jakobson's ideas, his reaction was as follows: "Ah! I have been there before!" By 1961, he had been grappling with relational systems for at least a decade, and Jakobson's method offered robust analytical tools. That year, he also published two essays—"Golden Bough or Gilded Twig?" and "Lévi-Strauss in the Garden of Eden: An Examination of Some Recent Developments in the Analysis of Myth"—which signaled his fascination with Lévi-Strauss and the shift of interest from kinship and politics to narrative, art, and myth. From then on, Leach wrote prolifically on art, ritual, architecture, mythology, communication, biblical narrative, humanism, masquerades, computing, time, and the meaning of hair, among other topics. For at least a decade, he brandished Lévi-Strauss's name in his attacks on functionalism, acquiring the reputation of an advocate. But he never took on Lévi-Strauss's structuralism in its entirety and in fact rejected much of it, especially as it later began to crystallize into a metatheory of cognitive universals. Leach described himself, in a characteristically defiant manner, as both a "functionalist" interested in how things "worked" and a "structuralist" who strove to understand the required cognitive machinery. But he never fully subscribed to either theory. Although Leach was driven by the desire to grasp general patterns, and even provocatively claimed that he was "bored by the facts," his loyalties remained with ethnographic detail, never to be trumped by theory.

Legacy

Leach's painstaking attention to and admiration for ethnography came out in his excitement about the work of his students, to whom he devoted tremendous amounts of energy and time. As in his own work, he insisted on independent thinking and welcomed challenges to his own assertions, in fact scolding students for failing to disagree with him. The resulting major achievement was a generation of leading anthropologists—including Ray Abrahams,

Fredrik Barth, Jean La Fontaine, Chris Fuller, Stephen Gudeman, Alfred Gell, Stephen Hugh-Jones, Caroline Humphrey, Adam Kuper, Jonathan Parry, Marilyn Strathern, and Nur Yalman, among many others—whose regional foci, subject matter, and theoretical attitudes have been as wide-ranging as his own.

Leach remained a maverick, intellectually as well as institutionally. Although he became a lecturer in social anthropology at the London School of Economics in 1946, moved to Cambridge in 1953, became Provost of King's College, Cambridge (1966–1979), was president of the Royal Anthropological Institute (1971–1975), was elected fellow of the British Academy (from 1972), and was knighted in 1975, Leach remains the most prominent British anthropologist never to become a professorial head of department. His persistent dissent from intellectual orthodoxies was strategic. What was surprising was that what first drew him to anthropology in China, and his continued fascination with the "exotic," did not amount to unfocused reflections on the "Other" but to a real intellectual method. Leach constantly sought out contrasts between "us" and "them" to offer new insights into the lives of others, and in the process into ourselves. He saw theoretical statements as intellectually deadening if they became mental objects in their own right instead of aids to better understanding. Theory had to follow empirical observation, not the other way around, a message that remains as pertinent to anthropology now as in Leach's own day.

Leacock, Eleanor

Eleanor Burke Leacock (1922–1987), known to friends and colleagues as "Happy," had an extraordinarily active and productive career as a Marxist-feminist anthropologist. Leacock was admired for her politically committed scholarship, and she was always outspoken against injustices and exploitation. The daughter of the well-known literary critic Kenneth Burke, she was also remarkable for her ability to combine being a mother of four, a wife (she was married twice), chair of the anthropology department at City College, City University of New York for 9 years, and a political activist. Despite her multiple involvements, she was always available as a loyal friend, supportive colleague, and encouraging teacher who fought forcefully to assist minority students and to promote the careers of Third World and female colleagues.

Leacock died in Honolulu on April 2, 1987, of a stroke suffered a few weeks after returning to Samoa to complete the fieldwork that she had begun in 1985 on the problems of urban youth. This last field project, in keeping with her previous work, was undertaken to gather detailed ethnographic material with which to challenge analyses that she regarded as theoretically unsound and politically pernicious—in this case, Derek Freeman's claim that suicide and rape among contemporary Samoan youth reveal the "darker side" and "grim realities" of an unchanging Samoan culture earlier described by Margaret Mead.

As a leading U.S. Marxist-feminist anthropologist, Leacock carried out fieldwork in four major

world regions—the United States and Canada, Europe, Africa, and the Pacific—addressing a wide range of topics, including hunting-and-gathering societies, ethnohistory, urban anthropology, anthropology of education, cross-cultural studies of women, and Marxist anthropology. In all, she published 81 articles and 10 books (some edited). She is best known for her historical and ethnographic analysis of egalitarian societies and gender relations, with a focus on the transformations that produced or intensified inequalities of class, race, and gender. This work constituted a major contribution to the development of Marxist historical/evolutionary theory. Her other body of work addressed the contemporary sociocultural reproduction of inequality in U.S. society. Here, she detailed processes by which specific practices and concepts produce and reproduce forms of race, class, and gender inequalities and their intersections. Her ethnographic work attacked previous approaches that assumed the universality of both private property and male dominance.

Leacock's early fieldwork in British Colombia's Fraser Valley with the Harrison Indians during the summer of 1945 was followed by research on child training in Germany, Switzerland, and Italy during 1948–1949. Two periods of field research with the Montagnais-Naskapi (Innu) in Quebec and Labrador in 1950–1951 resulted in her dissertation *The Montagnais "Hunting Territory" and the Fur Trade* (1954), a published work of major theoretical significance. This early Innu research employed detailed ethnohistoric and ethnographic data to show that the so-called individually owned family-hunting territory was a product of the French fur trade and not aboriginal. This challenged the then current antievolutionary, anti-Marxist beliefs concerning the existence of primitive concepts of private property. At the same time, she pioneered the view that non-Western cultures could not be properly understood without examining the harmful effects of colonialism, along with people's forms of cultural resistance to colonial domination.

Like many other woman scholars of her generation, Leacock spent the first decade of her career employed on urban-based research projects—mental health, interracial housing, and city schools. In 1963, she joined the faculty of the Polytechnic Institute of Brooklyn as a full-time member, and in 1972 she accepted the chair of the anthropology department at City College, City University of New York, where she remained until her death. In 1970–1971, she went to Zambia to study primary schooling in relation to community background, and 14 years later, she began her research on Samoan adolescents.

In the 1960s, Leacock became engaged in three major new projects: (1) American Indian ethnohistory, (2) the rehabilitation of major classics in social evolutionary theory by Lewis Henry Morgan and Friedrich Engels, and (3) coediting with colleagues at Polytechnic a 10-volume series of readings called *Social Science Theory and Method: An Integrated Historical Introduction*. The latter reinforced her interest in developing a unified philosophical and methodological approach to the natural and human sciences, an interest she later returned to in her writings on emergent levels of integration in human evolution.

As a Marxist and an accomplished and critical ethnographer, Leacock was uniquely qualified to reintroduce Morgan's and Engels's work to new generations of readers. The Leacock edition of Engels's *The Origin of the Family, Private Property, and the State* has become the standard one for most anthropologists, a key text in the rebirth of a Marxist-feminist tradition of scholarship. Her combining of evolutionary theory with careful ethnography and ethnohistory also informs a series of coedited volumes on women's experiences historically and cross-culturally.

Leacock retained a lifelong interest in the emergence of and transformations in stratification and gender hierarchies. Her focus was on two kinds of social transformations: (1) those brought about by processes of state formation and (2) those produced by Western colonialism and world capitalism. She synthesized her thinking on these issues in three important articles published in 1975, 1983, and 1986. Her evolutionism always sought to identify concrete processes of conflict and change in specific historical/cultural contexts and to relate these to emerging levels of sociocultural complexity. And as a Marxist anthropologist, Leacock privileged the long-term development of commodity production and exchange as her central analytic concept in evolutionary developments.

Leacock's work on the social reproduction of contemporary forms of inequality employed ethnography to expose the social and ideational processes involved in race and class inequality. Her 1969 *Teaching and Learning in City Schools* became an

early model of classroom ethnography in the growing field of the anthropology of education. At the time, she was active in the lively struggles around community control over schooling that took place in New York City. Her 1970 article in *Schools Against Children, the Case for Community Control* and her 1971 edited book *The Culture of Poverty: A Critique*, which criticized Oscar Lewis's "culture of poverty" concept, are excellent illustrations of the way she linked her research to concrete grassroots movements for empowerment. At another level, her *Myths of Male Dominance* (1981) reveals the importance she gave to combating concepts she saw as distorting reality and harmful politically—such as the structuralist notion concerning the exchange of women or the assumption that had plagued early gender research, namely, that male dominance was a universal.

Leacock defended the view that the subordination of women was a product of history and not a transhistorical, universal condition. She criticized attempts to "naturalize" patriarchy by projecting it on all societies at all times. First, she documented the autonomy and power of women in preclass societies and the effects of colonialism and imperialism in undercutting this power. Second, she gave searching scrutiny to the social milieu that gave rise to the ahistorical, essentialist theories of women's subordination and to the interests such theories served. She insisted that gender analysis not be restricted to a separate category of study but become central to all social analysis.

For Leacock, cross-cultural studies were important not only because they challenged what was taken for granted but also because they offered an alternative vision of more egalitarian, people-centered lifeways. By focusing on the social context of theory formation, she encouraged her students to reflect on their positioning in society and on how the questions we ask are shaped by broader issues. For Leacock, reflexivity was not just a theoretical stance; it was a practice that grew out of political engagement. She played a central role in the development of The International Women's Anthropology Congress, an international network of anthropologists and others interested in research on gender that is informed by a cross-cultural perspective and that is global in its concerns. It was this engagement and holism—the unity of theory and practice—that characterized all of Leacock's life and work. Her work remains relevant today.

LeVine, Robert

Robert Alan LeVine (1932–) is a leading figure in psychological anthropology, having contributed to the field since the late 1950s. LeVine's work is particularly distinctive for its breadth, covering topics in child development research, psychoanalysis, culture theory, education, and demography. In each topical area, LeVine has formulated a conceptual framework designed to synthesize existing knowledge and establish priorities for future research. He has also attempted to unify psychological anthropology in terms of its shared history, theory, concepts, and specific problems of interest.

Biography

LeVine was born on March 27, 1932, in New York City. He entered the University of Chicago in 1949. In his first year, he took David Riesman's culture and personality course, and Riesman became his long-term mentor. He received his BA in 1951, and his master's degree, also from Chicago, in 1953. His advisor, Fred Eggan, arranged for LeVine to work with Clyde Kluckhohn at Harvard. LeVine began doctoral work there in 1953, with David M. Schneider as his adviser.

Once at Harvard, LeVine found that his interests corresponded with those of John and Beatrice Whiting, who were just beginning the Six Cultures Study of child socialization in six diverse cultures. LeVine became research assistant to Beatrice Whiting and later received a Ford Foundation fellowship to go to Kenya to perform child socialization research there. When he got back in 1957, he wrote his dissertation under John Whiting's direction, with Kluckhohn as one of the committee members.

Major Works

LeVine taught first at Northwestern University (1958–1960), then at the University of Chicago (1960–1976), where he continued research on child rearing and development in Africa and undertook training at the Chicago Institute for Psychoanalysis. In Chicago, he was influenced by Clifford Geertz, Heinz Kohut (at the Chicago Institute for Psychoanalysis, where LeVine was a research candidate), Melford E. Spiro, and Donald T. Campbell at Northwestern (with whom he collaborated on the cross-cultural study of ethnocentrism, in *Ethnocentrism: Theories of Conflict, Ethnic Attitudes, and Group Behavior*, 1972). His orientation shifted toward cultural phenomenology and symbolic analysis while remaining empirically focused on the study of childhood environments. One product of those years was *Culture Behavior and Personality* (1973), LeVine's major attempt to provide a new framework for psychocultural research. Another was his chapter "Cross-Cultural Study in Child Psychology," replacing Margaret Mead's chapter in the third edition of *Carmichael's Manual of Child Psychology.*

LeVine's work from 1973 onward, including his years at Harvard (1976–1998 and beyond), can be divided by topical areas as follows: (a) person-centered ethnography, (b) parenting and early childhood, (c) schooling, and (d) history of psychological anthropology.

Person-Centered Ethnography

In *Culture, Behavior, and Personality*, LeVine considered how to revive the project on culture and personality originally launched by Edward Sapir, Mead, and Ruth Benedict. Influenced especially by the social psychologist Donald T. Campbell, Levine proposed that culture plays adaptive roles in the individual's mental functions and behavioral patterns and that a method based on psychoanalysis was the best way to uncover the emotional dynamics of this psychocultural adaptation. Deviating from orthodox Freudian theory, LeVine advocated the need to investigate culture-specific experiences. In the second edition (1982) of *Culture, Behavior, and Personality*, LeVine proposed a "person-centered ethnography" focused on cultural narratives of the self in several arenas of social communication. More broadly, he argued that most theoretical formulations in psychological anthropology can be recast as proposed relationships between the external world of collective cultural representations and the internal world of individual psychodynamics. Two examples of his own work in this vein are the articles on funerals (1982) and house design (1991) among the Gusii of Kenya.

Parenting and Early Childhood

In the late 1960s and later, LeVine combined quantitative approaches with qualitative approaches

in studies of parents and children in different cultures. With his wife, Sarah, he conducted fieldwork on early childhood among the Hausa of Nigeria (1969) and the Gusii of Kenya (1974–1976). The Gusii Infant Study involved naturalistic observations of infants' social environments over a 17-month period. Their findings showed these to be organized by locally formulated standards of child rearing, reflecting not only moral traditions but also on ecological factors that included threats to child survival, high fertility, and the need for children's labor contribution to domestic agriculture. Levine's Gusii work exemplifies his "cultural mediation" synthesis, showing cultural models of parenting everywhere as filtering multiple influences and providing parents with a "moral direction," a "pragmatic design," and "conventional scripts for action" (LeVine et al., 1994).

Schooling: Communicative Resocialization in the Less Developed Countries

In 1976, LeVine moved to the Harvard Graduate School of Education. Concern with the high fertility rates among the Gusii and convinced that women's schooling played an important role in the demographic transition to lower birth and death rates, LeVine decided to investigate the processes by which schooling has an impact on demographic change. With his wife, Sarah, and their students, he conducted studies of maternal literacy in Mexico, Nepal, Venezuela, and Zambia. Their data showed that even rudimentary literacy skills acquired in low-quality schools helped mothers attend to public health messages and services and gave them the cognitive skills to navigate the bureaucratic processes needed to obtain health services for their children. This theory of communicative socialization in school, based on the work of Max Weber, Lev Vygotsky, and Sylvia Scribner and Michael Cole, was presented in the 2012 volume *Literacy and Mothering: How Women's Schooling Changes the Lives of the World's Children*, winner of the American Psychological Association's 2013 Eleanor Maccoby Award.

History of Psychological Anthropology

LeVine always treasured the legacy of the culture and personality movement, which had come into disfavor in anthropology and the social sciences just as he became a graduate student, and he saw himself as continuing its work. His research on child rearing was clearly part of a project initiated by Mead and amplified by the Whitings, and his person-centered ethnography was based on the ideas of A. Irving Hallowell. In his retirement, LeVine traced the historical antecedents further, to Sapir's (1993) visionary teachings and Franz Boas's study of the physical growth of immigrant children. Like Sapir, LeVine embraced the child's acquisition of culture as the central process relating culture to the individual psyche. His *Psychological Anthropology: A Reader on Self and Culture* (2010) presents his recent views on this history and its significance for the field.

LeVine's Legacy

In his research career, LeVine strove to realize the potentialities for scientific understanding he saw in the culture and personality movement. His goal was to transform psychological anthropology into a "population psychology" resembling other population sciences that study distributions of individual characteristics in ecological context. To this end, he developed conceptual syntheses, launched comparative research linking microsocial with macrosocial variables, and explored the history of psychological anthropology to understand where it had come from—the better to determine where it should be going.

Lévi-Strauss, Claude

Claude Lévi-Strauss (1908–2009) was the preeminent French anthropologist of the 20th century and a founder of the theory of structuralism. His prominence reached far beyond France and beyond anthropology. His work was influential in literary studies, philosophy, and the humanities more broadly, as well as in certain areas of information science. He was translated into many languages and was particularly well received in the United States, Canada, the United Kingdom, and Japan. His work covered a wide range of material—Australian kinship, Greek myth, Northwest Coast masks—but was centered on his interpretation of Native American oral literature. This literature—drawn from the Arctic to the tip of South America—provided an infinitely rich source of material for Lévi-Strauss's interpretive devices. He claimed to be able to connect these widely disparate myths in the context of a hemispheric whole.

Early Life

Lévi-Strauss was born in Paris, in a neighborhood (16th arrondisement) where he would spend most of his life. His father was a modestly successful portrait painter, who preferred the older, academic style to the forms of modernism that were popular in the early 20th century. This situation provided the young Lévi-Strauss with a rich visual environment and early training in art, as well as a sense of cultural dynamics and historical change. His maternal grandfather, with whom he lived during the First World War, was chief rabbi in Versailles. From him, Lévi-Strauss developed a sense of the opposition between the world of the sacred and ritual and the secular everyday world that he and his parents inhabited. Such insights would prove relevant in his later anthropological career, especially as he would consider the ability of ritual to create its own reality apart from the everyday world.

Lévi-Strauss attended school at the Lycée Janson de Sailly and the Lycée Condorcet. He studied law and philosophy at the Sorbonne, receiving his *aggrégation* in the latter, despite his dissatisfaction with what he felt to be the pseudo-sophistication and mechanical style of philosophical discourse. He went on to teach in provincial high schools for several years. During this time, he married his first wife, Dina Dreyfus, with whom he would share the beginnings of an anthropological career.

Lévi-Strauss's move toward anthropology was facilitated by a serendipitous opportunity in 1935 to teach sociology in Brazil, at the University of São Paolo. This was part of a French cultural mission that reflected the prestige with which French culture and scholarship were regarded in that country. Although he was promised that there would be Indians in the suburbs of São Paolo, this was patently untrue. What he found instead was a somewhat dowdy colonial town that gave way to rustic suburbs and then to the forested hills of the interior. Eventually, he was able to travel to the north into Amazonia, where he made contact with Indian groups such as the Caduveo, living in two worlds. Finally, at the end of his 4-year stint in Brazil (with trips back to France each year), Lévi-Strauss planned and mounted an expedition to the Mato Grosso and Amazonia, where he encountered the Bororo, the Nambikwara, and the Tupi-Kawahib. This was a true expedition, of the sort last seen around the turn of the century, involving a half a dozen scientists (including Dina Lévi-Strauss and the Brazilian anthropologist Luiz de Castro Faria), numerous support personnel, mules, trucks, and huge amounts of provisions and items for barter. Funded by the Brazilian government, the logistics of this operation impeded the scientific aspects of the project. Additionally, sickness and injury meant the loss of team members (Dina was forced to return to São Paolo for treatment of conjunctivitis). Beyond this, the very design of the expedition, according to an outmoded idea of ethnographic research, meant that Lévi-Strauss and the others would have only weeks with each tribe, never reaching the point of rapport or easy communication. Nonetheless, Lévi-Strauss was able to record material of interest. A keen observer and gifted draftsman and photographer, he brought back important images and insights into material culture, bodily adornment, and kinship. Although not yet a "structuralist," he was beginning to move in that direction by observing societies that organized themselves around the principle of complementary opposition.

Lévi-Strauss returned to Paris in 1939 with a great many material artifacts destined for the new Musée de l'Homme. This material provided the

basis of their South American collection, as his later Northwest Coast collection would for that region. (Both are now at the Musée de Quai Branly.) His interest in material culture was shaped by his own early interest in art and aesthetics and reinforced by his mentor Marcel Mauss.

When the Germans crossed the Maginot line in 1940, Lévi-Strauss was called to military service in northern France. This was for a brief period, and he returned to Paris and then moved to Montpelier, in the south of France, where he was given a teaching post. However, the Vichy government soon passed racial laws that ended his employment. He realized almost too late the virulence of the anti-Semitism within France and made an effort to flee. He hoped to return to Brazil and was nearly successful but was denied a final visa stamp. His only option was to take a steamer to Martinique. His fellow refugees included figures such as the surrealist writer André Breton. By various strokes of good fortune (he was under the protection of the ship's captain, who remembered him fondly from previous sailings to Brazil), he made his way to Puerto Rico. There, he was placed under house arrest while his ethnographic papers were examined. Eventually, he was allowed to proceed to New York, where he had an invitation to teach at the New School for Social Research.

Lévi-Strauss in New York

If the period in Brazil was crucial for Lévi-Strauss's understanding of American Indian cultures (it would prove to be his only stint of fieldwork, brief though it was), his time in New York during World War II was a period of phenomenal intellectual dynamism. The assortment of European refugees gathered in Manhattan provided a fertile milieu for developing new ideas. Many were employed at the New School for Social Research, and many were also part of the circle of Franz Boas, who, although in his 80s, made an effort to welcome and encourage these younger scholars and artists. Lévi-Strauss was immediately drawn into that circle, as he had already become enamored of the textual ethnographies produced by the Bureau of American Ethnology, to which Boas contributed many volumes. This was to become the basis of his greatest achievement: the four-volume *Mythologiques*, an analysis of myth and cultural data recorded in these and similar publications. In 1942, Boas died literally in Lévi-Strauss's arms in the faculty club at Columbia University.

A second key figure in this period was Roman Jakobson. It was he who gave Lévi-Strauss the intellectual underpinnings for what would become structuralist anthropology. Jakobson, a linguist who specialized in phonology, had adapted Saussurian linguistics to an analysis of distinctive features in language, extending beyond phonology to syntax and semantics. The underlying point—that linguistic value and, hence, meaning were constructed in a context of opposition among features, not by any inherent qualities—appealed to Lévi-Strauss because it expressed insights that he had already acquired regarding ethnographic data. Lévi-Strauss would extend this perspective to an analysis of kinship, myth, ritual, and other cultural data.

In New York, one final piece to Lévi-Strauss's professional profile would fall into place: his interest in Northwest Coast culture. Obviously, Boas was influential in this development (as had been Mauss back in Paris). But probably most significant were Boas's displays at the American Museum of Natural History and the availability of Northwest Coast artifacts for sale through Manhattan dealers at prices that even refugee academics could afford. He acquired a considerable collection of masks and other objects while in New York, and would, much later, write a remarkable book, *The Way of the Masks*, on the relation of mask form to ritual function in neighboring Northwest Coast societies.

Beyond his professional development, his time in the United States was a transformative period of his life. His experience of New York and Chicago provided him with a different idea of what a city, and what modern civilization itself, could be, which he had not found in either European cities or their colonial copies, such as São Paolo. Like other exiled French intellectuals, such as Simone de Beauvoir, Lévi-Strauss wrote affectionately of his time in the United States. Indeed, he stayed on for 2 years after the war as a cultural attaché.

Return to Paris

Lévi-Strauss returned to Paris at the end of 1947. Over the next 2 years, he submitted two publications to be considered as qualification for his doctorate in anthropology. These were accepted, and Lévi-Strauss eventually obtained a teaching position.

During the 1950s, Lévi-Strauss both was shaped by and helped shape the institutional and intellectual milieu of postwar France. In 1950, the new organization the United Nations Educational, Scientific, and Cultural Organization, based in Paris, commissioned a work that would become *Race and History*, a significant meditation on an emerging issue of great import. During this period, Lévi-Strauss worked assiduously to carve out an institutional space for anthropology as a "human science," space that necessarily would be taken from humanistic disciplines, given the limited resources available. Unlike the United States, France did not experience rapid growth in the academy during the 1950s. The academic philosophy that he found so stultifying and nationalistic academic history were his main targets. By the end of the decade, Lévi-Strauss had successfully created a home for anthropology in the new Laboratoire d'Anthropologie Sociale affiliated with the Collège de France.

Far from wishing to isolate anthropology from other intellectual currents, Lévi-Strauss engaged in the broader exchange of ideas taking place in the Left Bank cafes of postwar Paris. Lévi-Strauss was close to Jean-Paul Sartre and Simone de Beauvoir, and he exerted a strong influence over a younger generation of philosophers, notably Michel Foucault and Jacques Derrida. His ideas were borrowed by Louis Althusser and Maurice Godelier in their attempt to forge a structural Marxism in the late 1960s. His influence within anthropology was especially pronounced among his English and American colleagues, notably Edmund Leach, Mary Douglas, and Marshall Sahlins. In recognition of his increasingly global reputation, Lévi-Strauss was elected to the Académie Française in 1973 and received a number of honors both in France and internationally in the subsequent 4 decades.

Key Ideas

Alliance Theory and Totemism

In *The Elementary Structures of Kinship*, Lévi-Strauss tackles one of the central themes of English structural functionalism. Within that tradition, as represented by A. R. Radcliffe-Brown, the key issue was descent. Descent and ways of reckoning consanguinity (e.g., matrilineal or patrilineal) defined social identity. Lévi-Strauss, by contrast, emphasized affinity—that is, marriage relations among groups. Following from his early observations of the Bororo in Brazil, Lévi-Strauss saw the "exchange" of women among groups that defined themselves in opposition to their partners as following formal rules that embedded exogamous social groups within multigenerational contexts of exchange and alliance. In this way, two groups mutually constructed themselves, creating a social whole out of two interdependent, incomplete parts. The Australian and Kachin marriage systems he analyzes in *Elementary Structures* are much more complex but can be seen as an elaboration of the underlying principle.

Social identity, like all questions of cultural meaning, is oppositional. It is also, as Ferdinand de Saussure argued for language, arbitrary. Thus, the incest taboo was for these societies not a question of the degree of consanguinity as it was of the demarcation of arbitrary social boundaries. Indeed, in certain societies, such as those of the northern Northwest Coast, the preferred marriage partner may well be a cross-cousin: a much closer relative than almost all members of one's own clan, which constituted the exogamous group. Implicit in these marriage relations was exchange: of material goods and symbolic properties (e.g., names and ritual dances on the Northwest Coast). Building on an insight developed by Émile Durkheim and Mauss, Lévi-Strauss viewed reciprocity as an essential building block of society.

The main mode by which primitive cultures understood the complementary opposition of social groups was the model of the natural world. The essence of totemism is relational, not substantive. As Lévi-Strauss famously quipped, totems are "good to think" (rather than eat). Thus, the opposition between raven and eagle for the Northwest Coast cultures (an opposition approximately as that between Odysseus and Achilles in Homer) provides a template for the opposition between two human groups, the Raven and Eagle clans.

The Structural Study of Myth

Most of Lévi-Strauss's academic writing was on the theme of myth. We learn a great deal by example about his method in *Mythologiques*. However, his most programmatic writing on myth, as well as his most famous, is his reanalysis of Oedipus. Against the background of perhaps the most famous and influential interpretation of myth, Lévi-Strauss argued audaciously against Freud's famous and

influential interpretation of the Oedipus myth as a recapitulation of a primordial series of events of universal importance. As the notion of incest is itself subject to very diverse interpretations depending on cultural context, Lévi-Strauss knew that such a global, archetypal reading was not correct. Rather, he analyzes the mythical elements ("mythemes") that arise in the myth itself and arranges them in terms of structured oppositions and mediations. Some of this is fairly straightforward: overvaluation versus undervaluation of kinship ties, while other oppositions (autochthony vs. impeded locomotion) are more recondite. Nevertheless, he demonstrates convincingly that myths must be read both syntagmatically (in the order in which events are told) and paradigmatically (where themes resonate with parallel or opposed themes in other parts of the myth). Here, he employs a theme that runs throughout his work on myth: music and the symphonic structuring of elements by counterpoint, harmony, repetition, and so forth. Like a symphony, a myth must be listened to carefully with a connoisseur's ear. Although his method has been viewed as rather mechanistic, due in part to Lévi-Strauss's own insistence that it is scientifically rigorous, it is in fact a highly aesthetic mode of interpretation.

At the root, Lévi-Strauss claims that myth is about fundamental, existential oppositions, themselves universal but interpreted in highly culturally specific ways. Life and death, culture and nature, male and female are among the most basic of these. Myth thus expresses these universal concerns while resolving them in some way. Oppositions are mediated. Thus, cooked food is contrasted with raw food (nature); but these may be mediated culturally by partially cooked food, viewed culturally as falling between the two.

Mediators may also be agents, in which case they take on the role of tricksters. In North American myths, tricksters are usually Raven or Coyote. They are mediators because they are scavengers, falling between the category of herbivores (who collect rather than hunt their food) and beasts of prey (who eat meat). This invokes larger oppositions between agriculture and hunting, and between life and death. As agents, tricksters are very potent characters, even to the point of bringing the world into being (as Raven does in a Haida myth). They are also figures who provide a comical, photographic negative image of the established social order. Uncontrollable sexuality and other appetites define them. As such they may be seen to mediate between the cosmos and chaos; while they flout all standards of acceptable behavior, they at the same time acknowledge those standards in specifically breaching them.

"Wild Thinking"

This is an alternate translation of the title of Lévi-Strauss's most important single volume, *The Savage Mind*. Here, he sets out to address another central anthropological question: the so-called psychic unity problem. Were all humans equipped with comparable cognitive faculties, a position central to both evolutionary and structural-functionalist anthropologies, or was there such a thing as a "primitive mentality" in Lucien Lévy-Bruhl's phrasing, an idea that has held a certain appeal among Romantic thinkers of all stripes? Lévi-Strauss sides with the unitarians but with a twist: The thought process of "primitive" people is equally impressive as that of we moderns, but they begin from a different epistemological starting place. Unlike the model of modern science, beginning with formal systems of classification and scientific theories from which one can generate hypotheses, the "savage" thinker begins with the data on hand and constructs classifications based on what she or he determines to be the significant features. Thus, local taxonomies of plants or animals are bound to differ from Linnaean ones, but they too are based on empirical data. Thus, the main difference is that the wild thinker is a radical inductivist rather than a deductivist. This is, interestingly, how Lévi-Strauss viewed his own thought process. He immersed himself in all kinds of information: tide charts, star maps, topographical maps, fisheries data, along with all the ethnographic and myth data, when writing about Northwest Coast cultures. This was, as it were, his Boasian side; he certainly possessed a more formal, deductive side as well.

Lévi-Strauss's term for this mode of thought was "science of the concrete." A companion term, which stands in relation to it as engineering does to science in the Western context, is *bricolage*, a common French word meaning something like tinkering: building or repairing things with materials at hand (similar to Heidegger's notion of "building"). That is, one begins not with a master plan but with

a critical and creative assessment of the materials at hand, a noticing of the relations (similarity, complementarity, opposition, etc.) that pertain among them and how these elements and their relations may be put to use. This describes not only material building of structures but also the rebuilding and restructuring that is constantly occurring in myths. Myth elements circulate freely across cultural and linguistic boundaries but are transformed as they cross them. Culture is not static, although in many cases (as in "cold" societies), it pretends to be. Rather, it is rebuilt using the principles of bricolage. Again, Lévi-Strauss considered himself a *bricoleur*, which does fairly well describe his method of analyzing myth.

Identity and Alterity

Beginning with some of his earliest writings, Lévi-Strauss was concerned with the relation between alterity and identity. As he describes exogamous, totemic clans in Australia or moiety organization in Amazonia, he forcefully makes the point that difference, although arbitrary, is what constitutes identity, rather than something inherent or essential to the group (although that may well be the ideology of the said group). This applies not only to tribal society but to modern nation states as well. In *Race and History*, Lévi-Strauss identifies the problem of creeping global monoculture, or cultural entropy, as a fundamental threat to human well-being. On one level, this echoes long-standing Gallic complaints about the intrusion of Anglo-Saxon language and culture (a topic with which Lévi-Strauss as a member of the *Académie Française* was intimately familiar). However, for Lévi-Strauss, this was only part of a larger assault on cultural difference.

The problem with global monoculture is not only the loss of cultural distinctiveness but also the loss of the "Other" as a foil to identity. It is a version of what Max Weber called the disenchantment of the world. A world in which everything significant takes place in a space dominated by the monoculture of information technology with English as the lingua franca is culturally much reduced. It is a recapitulation of what Lévi-Strauss observed in Brazil in the 1930s: Tribal cultures were being absorbed into a "sad" relationship of dependency with the global world system. By the end of the 20th century, even large and powerful nation-states were threatened with a similar fate.

Significance

The work of Lévi-Strauss has been extremely influential in anthropology and in related fields. In his later years, he distanced himself from the structuralist paradigm, to the degree that he actually denied being a structuralist. (This obviously was connected entirely with academic politics. Many other structuralists or quasi structuralists, such as Roland Barthes and Pierre Bourdieu, populated the French academic scene.) Like so many before him, it is evident that his genius lay mainly in synthesis rather than in purely original thought. One can trace the genealogy of his major concepts through fairly wide thoroughfares of French and European thought, whether of René Descartes, Jean-Jacques Rousseau, Henri Bergson, Karl Marx, Sigmund Freud, Émile Durkheim, or Ferdinand Saussure. His particular value was in applying these concepts to ethnographic and mythical material, in connecting them with problems of the modern world, and with fashioning a vision of anthropology as a "human science."

Lévy-Bruhl, Lucien

Lucien Lévy-Bruhl (1857–1939) was a French philosopher who became an armchair anthropologist. His first and most important anthropological work, *How Natives Think*, was originally published in France in 1910 as *Les Functions Mentales Dans les Sociétés Inférieures* and was translated into English only in 1926—3 years *after* the translation of his second and next most important anthropological work, *Primitive Mentality* (1923), originally published in France as *La Mentalité Primitive* in 1922.

"Primitive" and Modern Thinking

Lévy-Bruhl never asserts, as is commonly charged, that "primitive" peoples are inferior to moderns. On the contrary, he means to defend primitive peoples *against* this charge, made above all by the pioneering British anthropologists Edward Burnett Tylor and James G. Frazer. For Tylor and Frazer, "primitives" think the way moderns do. They just think less rigorously. For Tylor and Frazer, the difference between primitive and modern thinking is only of degree. For Lévy-Bruhl, the difference is of kind. He maintains that primitive thought is both mystical and prelogical.

Lévy-Bruhl attributes primitive thinking to culture, not to biology. Like other 20th-century anthropologists, he separates culture from race. What distinguishes primitives from us is their "collective representations." By collective representations (*représentations collectives*), a term taken from the French sociologist Émile Durkheim, Lévy-Bruhl means group beliefs, which for him are the same across all primitive societies. Primitive representations, or *conceptions*, shape *perceptions*, or experiences. According to Lévy-Bruhl, primitive peoples believe that all phenomena, including humans and their artifacts, are part of an impersonal sacred, or "mystic," realm that pervades the natural one. To take Lévy-Bruhl's most famous example, when the Bororo of Brazil declare themselves red parakeets, they mean that they are in all respects outright identical with red parakeets.

Mysticism is only the first of the two key characteristics of primitive mentality. The other characteristic, "prelogicality," builds on the first one but is more radical: It is the belief that all things are not only mystically one but somehow also distinct. The Bororo believe that a human is a parakeet yet still a human. They do not believe that a human and a parakeet are, say, identical invisibly while distinct visibly. That belief would merely be a version of mysticism, itself hardly limited to "primitives." Rather, primitive peoples believe that humans and parakeets are simultaneously both identical and separate in the same respects. Visibly as well as invisibly, humans and parakeets are at once the same and different. According to Lévy-Bruhl, that belief violates the law of noncontradiction—the law that something cannot be both *X* and non-*X* at the same time—and is uniquely primitive.

Lévy-Bruhl does not conclude, as is conventionally said of him, that primitive peoples cannot think logically, that they are mentally deficient. Instead, he concludes that "primitives," ruled as they are by their collective representations, regularly suspend the practice of logic. Primitive thinking is prelogical, but "prelogical" does not mean illogical. Still, many readers mistook prelogical for illogical, so that Lévy-Bruhl seemed to be making primitive peoples even more hopelessly inferior to moderns than Tylor and Frazer had made them—the opposite of his intent. However, in arguing that primitive thinking differs in nature from modern thinking, Lévy-Bruhl is not arguing that it is equally true. Primitive thinking does make sense in light of its premises, but its premises are still illogical: Something cannot simultaneously be both itself and something else in the same respects at the same time. Where for Tylor and to a lesser extent Frazer primitive thinking is false but still rational, for Lévy-Bruhl primitive thinking is irrational and consequently false.

Unlike many other anthropological writers of his day and ours, Lévy-Bruhl is not a relativist. Like both Tylor and Frazer, he is an absolutist. There are several varieties of relativism—conceptual, perceptual, and moral—but none fits Lévy-Bruhl. Conceptual relativism denies the existence of objective criteria for assessing the diversity of *beliefs* about the world. Beliefs can supposedly be evaluated only within a culture. Lévy-Bruhl is scarcely a conceptual relativist, since he is prepared to judge both mysticism and prelogicality outright as false beliefs about the world. Perceptual relativism denies the possibility of evaluating objectively the diversity of *experiences* of

the world. Where conceptual relativism allows for common experiences that simply get interpreted differently by different cultures, perceptual relativism, which is bolder, maintains that experiences themselves differ. One culture deems real the purported experience of a god. Another culture deems delusory the same experience. There is no way to judge these differing evaluations. Lévy-Bruhl is hardly a perceptual relativist, since he is prepared to judge the experience of oneness as delusory. Moral relativism, which denies that objective criteria exist for evaluating the undeniable diversity of *values* around the world, is not relevant to Lévy-Bruhl, who does not consider morality in his characterization of primitive thinking.

While Lévy-Bruhl takes the concept of collective representations from Durkheim, he stresses the differences rather than, like Durkheim, the similarities between primitive and modern thinking. For Lévy-Bruhl, primitive representations, or beliefs, come between primitives and the world. They determine how primitives experience the world and not merely how they think about the world. They shape perceptions as well as conceptions. Primitive peoples experience, not merely think, everything in the world as at once mystically one and separate. By contrast, modern representations, which do exist, shape only conceptions, and thus convey the world to moderns rather than come between moderns and the world. According to Lévy-Bruhl, modern representations, or beliefs, determine how moderns think about the world but not how moderns experience the world. Moderns experience the world as it actually is.

In a section of *How Natives Think* titled "The Transition to the Higher Mental Types," Lévy-Bruhl writes of "progress" in cognition. Progress requires the filtering out of the emotional elements that distort primitive perceptions. Only modern representations have been subjected to "the test of experience." In fact, for Lévy-Bruhl, it is only "scientific theorizing" that is abstract enough to be free of emotion and therefore free of mystical and prelogical proclivities. The difference between primitives and moderns is not, then, that moderns think wholly logically. It is that primitives think wholly prelogically. For Lévy-Bruhl, the emotional allure of mystical oneness makes its total disappearance unlikely, and he cites example after example of the retention of prelogical thinking among moderns. Conversely, he traces the lessening of mystical ties among primitive peoples themselves. The opposition that he draws is, then, between primitive and modern *thinking*, not between primitives and moderns *themselves*.

Many others no less absolutist than Lévy-Bruhl have been criticized far less severely. The reason is that, despite his undeniably neutral intent, Lévy-Bruhl in fact characterizes primitive mentality much more negatively than even Tylor and Frazer characterize it. Tylor and Frazer take for granted that primitive peoples recognize not only the law of noncontradiction but most "modern" distinctions as well: those between appearance and reality, subjectivity and objectivity, supernatural and natural, human and nonhuman, the living and the dead, the individual and the group, one time and another, and one space and another. True, for Tylor and Frazer, primitives fail to think sufficiently critically and thereby produce religion rather than science, but not because of any missed distinctions. Primitives still think, and think logically and systematically. For Tylor and Frazer, religion no less than science is the product of scientific-like observation, hypothesis, and generalization. It is not the product of primitive perceptions.

To be sure, for Frazer, the efficacy of magic, which for him constitutes a stage prior to that of religion, does presuppose the failure to make two distinctions: (1) that between the literal and the symbolic—for otherwise a voodoo doll would merely symbolize, not affect, a person—and (2) that between a part and the whole—for otherwise a severed strand of hair would merely have once been part of a person, not still affect that person. But Frazer never assumes that in even this stage, primitives are oblivious to the other distinctions that Lévy-Bruhl denies them, such as the distinctions between appearance and reality and between subjectivity and objectivity. And any distinctions missed by primitive peoples are, for Frazer, of conception, not of perception, which he, together with Tylor, considers invariant universally.

For Lévy-Bruhl, primitive peoples do not even have religion. What beliefs they do have come from their collective representations and not from any observations of the world, let alone from any rational responses to observations. Far from thinking rationally, primitive peoples, brainwashed by their mystical and prelogical beliefs, scarcely think at all.

Critique and Response

Lévy-Bruhl was castigated by field-workers who claimed never to have come on any culture with a distinctively primitive mentality. In *Primitive Man as Philosopher* (1927), the American anthropologist Paul Radin gave the classic anthropological rebuttal. Like other anthropological critics, Radin denies that primitive peoples miss the distinctions that Lévy-Bruhl declares them to be bereft of: cause and effect, subject and object, natural and supernatural, nonmystical and mystical, individual and group, and literal and symbolic. Yet Radin, unlike other anthropological critics, divides the members of any society, modern and primitive alike, into "men of action," who may well fail to make some of Lévy-Bruhl's distinctions, and "thinkers," who do not. By contrast, Lévy-Bruhl insists that the "average man" as well as the "cultured, scientific man" differ from primitive man.

Against Lévy-Bruhl, the French structural anthropologist Claude Lévi-Strauss, in *The Savage Mind* (1966) and elsewhere, similarly argues that primitive peoples think no differently than moderns. They merely focus on the observable, qualitative aspects of phenomena rather than, like moderns, on the unobservable, quantitative ones. Colors and sounds, not mass and length, faze them. Far from being prescientific, primitive peoples attain a fully scientific knowledge of the world. Theirs is simply a "science of the concrete" rather than of the abstract. And even if they do not, like moderns, separate abstractions from concrete cases, they do express abstractions through concrete cases. Furthermore, primitive knowledge is for Lévi-Strauss basically taxonomic, so that "primitives" are quite capable of categorizing. In fact, their taxonomies take the form of oppositions, which, as the equivalent, for Lévi-Strauss, of contradictions, make primitives not only aware of contradictions but also intent on resolving them. Myths most of all evince the austere, rigorous, logic-chopping nature of primitive thinking. No view of primitive peoples could be more opposed to Lévy-Bruhl's than Lévi-Strauss's.

The chief defender of Lévy-Bruhl was the English anthropologist E. E. Evans-Pritchard, above all in his *Witchcraft, Oracles and Magic Among the Azande* (1937). Yet even he faults Lévy-Bruhl for deeming primitive thinking prelogical. Where for Lévy-Bruhl primitive magic takes the place of science, for Evans-Pritchard magic and proto-science coexist. To the Azande, the sheer physical features of a tree explain its ordinary, natural "behavior." Witchcraft, Evans-Pritchard's most famous example of supernatural causality, explains only unfortunate events involving the tree: why one day it falls on one person or, to cite his most famous example, why a granary under which Azande are sitting collapses when it does. Witchcraft attributes to malevolent intent what science writes off as bad luck. For Lévy-Bruhl, in contrast, even events as regular and therefore as seemingly natural as birth, disease, and death get attributed to *magic*—a term that he, unlike Evans-Pritchard and others, uses broadly to encompass all supernatural causes. In shifting from the Azande to the Nuer, Evans-Pritchard, in *Nuer Religion* (1956), challenges Lévy-Bruhl's most striking evidence of prelogical mentality: statements, for example, that a cucumber is an ox and that human twins are birds. Lévy-Bruhl maintains that mystical representations override the senses, so that primitive peoples somehow actually perceive, not just conceive, a cucumber as an ox. Evans-Pritchard denies that they do either. The Nuer, he asserts, are speaking only metaphorically. They are saying that a cucumber is sufficiently like an ox to serve as a substitute for it. Similarly, a human twin is like a bird in certain respects but is not therefore a bird.

In his posthumously published notebooks, Lévy-Bruhl abandons his view of primitives as prelogical, though not as mystical. He does not, like Evans-Pritchard, assert that the Bororo, in deeming Trumai tribesmen fish, are merely comparing the Trumai with fish. He is claiming that the Bororo deem the Trumai mystically identical with fish. He does, however, now grant that the Trumai are fish supernaturally, not physically. Their "fishness" complements, not contradicts, their ordinary, physical humanness. Primitives thus recognize at least the distinction between the supernatural and the natural. But overall, primitive thinking remains distinct from modern thinking.

Lewis, Oscar

In 3 decades of field research, Oscar Lewis (1914–1970) contributed significantly to the shift in American anthropology away from North American Indians to peasant communities and finally to urban studies. Throughout his career, he was committed to the proposition that anthropologists should focus attention on the conditions of poverty. Especially in his writings on individuals and families, Lewis effectively employed the narrative approach to give a voice to the poor so that readers, whether anthropology students or government policymakers, would understand the challenges of living in poverty and the adaptations that people developed to it.

Biographical Data

Born in New York City in 1914 as Yehezkiel Lefkowitz (but also given the Anglicized first name Oscar), Lewis was the son of Jewish immigrants from Poland. For a time, his father practiced as a rabbi in New York City, but poor health forced him to move his family to a small town in upstate New York. There, the family had a farm and eventually constructed a family hotel on their land. The family struggled to succeed, being forced to move back to the city in the winters. Thus, Lewis grew up with firsthand experience of rural and urban poverty.

The first member of his family to attend college, Lewis entered City College of New York in 1930. Although the tuition was free, books and living expenses were a burden. He focused on philosophy and history and read extensively on Marxist approaches to the struggles of the poor. He received his bachelor's degree in social science in 1936 and was accepted into Columbia Teachers College. However, Lewis soon transferred to the anthropology department at Columbia, where he studied with Ruth Benedict and Ralph Linton. He married Ruth Maslow (sister of the psychologist Abraham Maslow) in November 1937 and also thus gained a lifelong research collaborator. The couple went together to the Blackfoot reservation in 1939, when Benedict organized a summer study there. This work led to his library-based dissertation, published by the American Ethnological Society. In 1940, the year in which he received his PhD, he legally changed his surname from Lefkowitz to Lewis.

In 1942, Lewis obtained a position at the Human Relations Area Files. While working there on the Strategic Index for Latin America, he obtained a grant to study Spanish during the summer. His focus on Latin America intensified when he moved on to a short-term appointment in 1943 at the Justice Department's Special War Policies Unit, concerned with propaganda. In August 1943, he was sent to Mexico as a representative of the Department of Interior's National Indian Institute. In this role, he was assigned to coordinate a joint study (known as the Indian Personality Project) with the Interamerican Indian Institute on the impact of government policies on Mexican Indians. The most important product of this work was his decision to begin a field project in the peasant community of Tepoztlán, located in the State of Morelos just south of Mexico City. When his assignment in Mexico was completed, Lewis was transferred to the Bureau of Agricultural Economics in the Department of Agriculture, where he first did a survey of ongoing research projects throughout the central states. Eventually, he did field research in Bell County, in central Texas, resulting in a monograph titled *On the Edge of the Black Waxy: A Cultural Survey of Bell County, Texas* (1948). Along with Walter Goldschmidt's study of a central California agricultural community, this is one of the first social anthropological studies of non-Indian rural America.

Lewis's first full-time academic position came in 1946, when he was hired as an associate professor at Washington University in Saint Louis. After 2 years there, he accepted an appointment at the University of Illinois, where he remained for the rest of his career—apart from a consultancy with the Ford Foundation in northern India during 1952–1954. Besides his administrative duties in India, he was able to conduct research with Indian field-workers and interpreters in the community of Rampur. This led to the publication of his 1958 monograph, *Village Life in Northern India*.

The Tepoztlán Restudy

While in Mexico in 1943, Lewis had initiated a restudy of the community of Tepoztlán, where, in 1926, the anthropologist Robert Redfield had done fieldwork that resulted in his monograph *Tepoztlán: A Mexican Village* (1930). The scope of Lewis's project went well beyond the mandate of the Indian Personality Project, within which it was developed. It became clear to Lewis that he would need to return to Mexico as soon as possible to gather additional data to complete what was collected in 1943–1944. He was finally able to return to Tepoztlán in the summers of 1947 and 1948. During these field trips, he and his wife, Ruth, focused on detailed family studies and individual life histories to complement the survey work that had been carried out earlier. When his monograph *Life in a Mexican Village: Tepoztlán Restudied* appeared in 1951, it set off a controversy among anthropologists concerned with the differences between the idyllic portrait sketched by Redfield for the late 1920s and the conflict-laden community described by Lewis for the late 1940s. The so-called Redfield-Lewis controversy has become the textbook example of the challenges facing anthropologists doing fieldwork and also provides an early example of the value of systematic restudies and long-term research in understanding the processes of community transformation.

The Mexico City Studies

In 1951, Lewis returned to Mexico City to take up the question of how well migrants from Tepoztlán adapt to life in Mexico City. He had first considered this question during his 1944 research but could not pursue it then. With a list of migrant families obtained from his contacts in the village, Lewis and his team of student assistants were able to visit some 100 families spread throughout the city. Just as he had with Redfield's work, Lewis now took on the standard model of "urbanism as a way of life," as proposed in 1938 by the sociologist Louis Wirth. Based on his analysis of the Mexico City data, Lewis wrote an article, "Urbanization Without Breakdown: A Case Study," published in 1952 in the general magazine *The Scientific Monthly*. Although published in an unusual venue for social anthropological research, Lewis's article has been reprinted many times and is considered a classic riposte to the claims by Wirth about the international applicability of a Euro-American model of urbanization.

Subsequently, in 1956, Lewis went to Mexico to carry out a more detailed study of family life. Using a tape recorder, he began to record detailed life histories of persons in Tepoztlán and of residents of Mexico City. The major results of this endeavor were the monographs *The Children of Sánchez* (1961) and *Pedro Martínez: A Mexican Peasant and His Family* (1964). With funding from a Guggenheim Fellowship and awards from the Wenner-Gren Foundation for Anthropological Research and his university, Lewis also began what would become his most famous and most controversial research: the culture of poverty.

The ethnographic base of the research was in two lower class *vecindades* (housing settlements) located in the old central section of Mexico City. These *vecindades* were selected to represent different socioeconomic levels among the poor in Mexico City. Subsequently, to look at the differences among other lower- and middle-class families, Lewis obtained additional funding from the Social Science Research Council (1958) and the National Science Foundation (1959). Thus, what became controversial research on the culture of poverty was supported by the most important funding sources then available to social anthropologists.

The results of his research came out in a 1959 monograph, *Five Families: Case Studies in the Culture of Poverty*, although the 1961 translation carried the more appropriate title *Antropología de la Pobreza: Cinco Familias* (Anthropology of Poverty: Five Families). Much of the controversy that erupted over Lewis's work on poverty focused on whether (or not) there was a culture of poverty, when Lewis originally meant only to elaborate an anthropological approach—emphasizing family case studies—to the

socioeconomic conditions associated with poverty in Mexico City. When *Five Families* was issued, Lewis had not yet worked out the characteristics of the culture of poverty. Eventually (in 1966), he published an article with that title in *Scientific American* and followed it with a 1969 article, "The Possessions of the Poor," in the same journal. A close reading of the numerous publications by Lewis during the 1960s on the culture of poverty suggests that for Lewis a comparative, cross-cultural *theory* of a culture of poverty was far less important than a recognition that the poor were always and everywhere with us in contemporary societies and that governments had responsibilities to deal with the situation of the poor. In the end, according to Lewis, being poor was *not* the fault of those who found themselves in poverty but was due to the social, economic, political, and cultural conditions in the society. It was not Lewis himself but other U.S. social scientists and political commentators (especially Daniel Patrick Moynihan, then Assistant Secretary of Labor in the Johnson administration, whose 1965 report *The Negro Family: The Case for National Action* focused on the role of ghetto culture as the key to the increase in single-mother families) who expanded Lewis's ideas about poverty to fuel the so-called War on Poverty during the 1960s and 1970s. Consequently, Lewis was unfairly criticized by numerous scholars for introducing a cultural view of poverty that misrepresented the results of his research in Mexico—and led him to pursue cross-cultural testing of his theory in New York, Puerto Rico, and Cuba.

The New York and Puerto Rico Studies

Always interested in testing ideas cross-culturally, Lewis wanted to go to Cuba after the 1959 revolution. However, after the Bay of Pigs fiasco, it proved impossible to get a visa. Instead, Lewis turned his attention to a comparative analysis of slum families in New York City and Puerto Rico. This study (funded by multiyear grants from the Social Security Administration of the Department of Health, Education, and Welfare) was intended to examine hypotheses about the characteristics and extent of the culture of poverty. Two monographs resulted from the study: *La Vida: A Puerto Rican Family in the Culture of Poverty—San Juan and New York* (1966) and *A Study of Slum Culture: Backgrounds for La Vida* (1968). However, even though the *La Vida* book was a public success and winner of a National Book Award, numerous anthropologists and other social scientists continued to have serious issues with the notion of a culture of poverty.

The Cuba Study

In 1969, Lewis finally was able to implement a field project in Cuba. There he hoped to test the hypothesis that the culture of poverty would be different (or even absent) in a socialist nation. Unfortunately, he was suffering from heart disease and was unable to see the project through to its completion. His wife, Ruth, carried on with the Living the Revolution project, and in 1977, the University of Illinois published (under the joint authorship of Oscar Lewis, Ruth Lewis, and Susan M. Rigdon) its major results in three volumes: *Four Women*, *Four Men*, and *Neighbors*. In addition, his colleague Douglas Butterworth compiled data for a study titled *The People of Buena Ventura: The Relocation of Slum Dwellers in Postrevolutionary Cuba* (1980).

Conclusion

Just before his untimely death from heart disease in 1970, Lewis collected some of his more important essays, articles, and book chapters into an eponymous volume *Oscar Lewis: Anthropological Essays*. This collection of 24 chapters is divided into six parts: (1) Theory and Method, (2) American Indians, (3) Rural U.S.A., (4) Peasantry, (5) Urban Studies, and (6) Selections From Life Histories. In arranging his own work in this manner, Lewis summed up his contributions to social and cultural anthropology. He challenged orthodox positions about rural and urban life; focused on fieldwork as the principal source of data; developed systematic research methods, especially involving family histories; believed in comparative analysis as cultural anthropology's hallmark; and was committed to social justice for impoverished people, whether living in the countryside or in the city, in the United States or elsewhere.

Lienhardt, Godfrey

Ronald Godfrey Lienhardt (1921–1993) was born to a Swiss father and English mother in Bradford, Yorkshire. Both he and his younger brother Peter Arnold Lienhardt studied at Downing College, Cambridge, reading English with F. R. Leavis. While retaining a fond connection with the north of England throughout their lives, both were eventually to become distinguished colleagues of Edward Evans-Pritchard at Oxford's Institute of Social Anthropology.

Godfrey's degree studies began in 1939 but were interrupted by military service during the Second World War, years that included a posting to East Africa. He returned to Cambridge in 1945, met Evans-Pritchard, and transferred to archaeology and anthropology. On graduating in 1947, he embarked on fieldwork among the Dinka people of southern Sudan. Oxford subsequently became his base, first as a postgraduate student, subsequently as a university lecturer, and then as a reader in social anthropology and as a professorial fellow of Wolfson College. He returned to the Sudan several times, extending his studies to the Anuak; he also had visiting positions in Baghdad, Iraq (1955–1956), and Accra, Ghana (1964); he visited Northwestern University, Illinois, for the award of an honorary DLitt in 1983.

Lienhardt's best known work remains his monograph *Divinity and Experience: The Religion of the Dinka* (1961). It is a story told through the reflections of those Dinka people Lienhardt came to know well and whose trust he had won. While dedicated to Evans-Pritchard and acknowledging his 1930s researches on the Nuer, it has a refreshing quality of immediacy and intimacy flowing from Lienhardt's sensitivity to the subtleties of language as well as his own deeply held, though very liberal, religious views (as a convert to Roman Catholicism). His exploration of Dinka understandings of *nhialic*, or "divinity" (and the various overlapping "divinities" as they manifested themselves in people's lives) begins with the practical activities of cattle herding. It moves on to the less obvious forms of social experience, through their images of patrilineage and clan, themselves dependent for continuing life on the marriage alliances created through transfers of cattle. Birth, illness, and death are part of a cosmology in which the human sphere is intermittently engaged with that of divinity, especially through the flesh, words, and dreams of those born to the priestly lines of "Masters of the Fishing Spear."

Lienhardt's insights into the experiential foundations of shared belief among the Dinka were further developed in lectures and publications. In these, he explored, for example, variable notions of the High God in Africa, the place of internal consciousness in African concepts of the person, and the harder edge of reciprocity. Among a range of Nilotic peoples, popular myths are told about lineage heads or royals demanding their lost or lent possessions back, even former gifts such as beads subsequently swallowed by a cow or a child. If pursued to the end, such a cow or child will have to die. The tale is sometimes told to explain why two lineages separated long ago or to illustrate how only royals could get away with such cruel behavior. One of his most influential papers is devoted to the impact of Catholic missionaries among the western Dinka and the way the meanings of religious terms were artfully shifted, and reimagined, in this new context.

The stories, myths, and conversations Lienhardt reports from his fieldwork are never simple ethnographic data—they are presented as a part of the ongoing life he engaged with among the Dinka. What gives a lasting quality to his writings is not so much an observer's "grand theory" as an approach to ethnography that privileges the *meanings* of human encounter—both within the community being studied and between the ethnographer and his or her informants. *Divinity and Experience* is widely regarded today as an anthropological classic, respected by historians and scholars of comparative religion and theology.

A similar direct approach to the realities of human encounter runs through Lienhardt's modest (but

much translated) introductory book of 1964, titled simply *Social Anthropology.* This work appeared at a time of transition, when cynics, at least in Britain, saw the end of empire and forecast the end of anthropology. However, the younger generation was looking to fresh sources for the renewal of the subject: Lévi-Straussian structuralism, Marxism as revived in France, and, sometimes in tandem, a new focus on anthropology "at home." In these various ways, they were seeking to make the subject genuinely universal, emphasizing similarity, and comparability, over difference. Lienhardt in his own way was doing this too. By focusing on how ethnographic research was actually carried out, Lienhardt's very readable account of the intellectual roots of anthropology introduces some memorable scenes of personal encounter. His lens is focused as much on the ethnographers themselves as on the people studied; taking an ironic swipe at Lévy-Bruhl's classic on primitive mentality (*How Natives Think*, 1910), his concluding chapter is ironically titled "How Anthropologists Think." He had little sympathy with casual notions of cultural relativism and was quite outspoken about this toward the end of his life.

Lienhardt was a warm, witty, provocative teacher; while taking a very modest attitude to career advancement, he accepted several invitations to deliver radio talks, and his informal seminars were always exciting events. His home was always open to students and visitors, especially from the Sudan (north and south) and from West Africa. Among the Sudanese scholars, Francis Mading Deng has paid special tribute to Lienhardt's friendship and influence in encouraging his own writings on the songs, poetry, and history of the Dinka. Lienhardt's papers and photographs are preserved at the Pitt Rivers Museum, Oxford.

Linton, Ralph

Ralph Linton (1893–1953), an American anthropologist, Curator of Ethnology at the Field Museum of Chicago, and President of the American Anthropological Association, is best known for his contributions to culture and personality theory and for books aimed at both popular and professional audiences.

Biographical Sketch

Several important dimensions of Ralph Linton's early life affected his scholarship in a number of interesting ways. Linton was born to a Quaker family in Pennsylvania in 1893. His father was authoritarian, which was the cause of some tension and bitterness according to Adelin Linton's 1971 account of her husband's childhood. Among other things, Ralph Linton manifested a disdain for anthropologists such as A. R. Radcliffe-Brown and Franz Boas, who were authoritarian in their dealings with students and who tended to attract faithful disciples. Linton was self-consciously more egalitarian in his interactions with students. This (in addition to having spent half of his career outside of universities with anthropology graduate programs) may be one reason why fewer anthropologists trace their direct intellectual lineage to him. It was also the case that Linton claimed no singular influence from any particular formative figure in the discipline. Nevertheless,

he had a profound influence at the undergraduate level on many students including Sol Tax, Clyde Kluckhohn, Abraham Maslow, and others, and he left a significant theoretical footprint on the field of anthropology.

Linton was an undergraduate at Swarthmore College from 1911 to 1915, and during that time, he undertook his first archaeological fieldwork in the American Southwest. It was archaeology that drew him to anthropology initially, although he later shifted toward cultural anthropology. He received a Master's degree at the University of Pennsylvania in 1916, after which he transferred to Columbia University to work with Franz Boas. Boas, however, found him to be an unremarkable student. Linton interrupted his studies to enlist in the military during World War I. When he returned from Europe to meet Boas and resume graduate studies, Linton came straight from Fort Dix, still in uniform. This likely annoyed Boas further because of his disagreement with American involvement in World War I, and Boas expressed deep skepticism that Linton could succeed in graduate studies at Columbia. This interaction with Boas led Linton to leave Columbia immediately and enroll at Harvard, where he received his PhD in 1925. This was the beginning of what was to become a long-standing tension between Linton and the Boasians that became progressively entrenched as Linton's career continued, and it was most pronounced when he replaced Boas as the chair of anthropology at Columbia in 1937.

Linton's career can be divided into four phases linked to the institutions where he worked: (1) as the curator of ethnology at The Field Museum of Chicago (1922–1928), (2) as a professor at the University of Wisconsin–Madison (1928–1937), (3) as the chair of the Department of Anthropology at Columbia (1937–1946), and (4) as a Sterling Professor of Anthropology at Yale (1946–1953). In his first position at the Field Museum, Linton became devoted to fieldwork. He spent almost 2 full years (1926–1927) on a museum expedition to collect artifacts and conduct ethnographic research in Madagascar. This resulted in a number of field reports and publications, including his 1933 monograph *The Tanala: A Hill Tribe of Madagascar*. While Linton would have liked to continue curation and fieldwork for the museum, sickness and an alluring offer to institute an anthropological curriculum at the University of Wisconsin–Madison drew him into academe. He soon became a much sought-after lecturer.

When he moved to Columbia University in 1937, Linton continued to grow in influence. At this point, his 1936 book *The Study of Man* was beginning to have an impact on the field. Linton also participated in the Social Sciences Research Council's Committee on Personality and Culture and on a subcommittee with Robert Redfield and Melville J. Herskovits. They jointly authored the "Memorandum for the Study of Acculturation," which spurred a generation of scholarship on the topic. This was an integral concept in the theoretical synthesis that Linton sought in *The Study of Man* and in his posthumously published *The Tree of Culture*.

Linton was an avid fieldworker, and he considered his success in mastering the cultural practices and gaining status in the institutions of the people he studied among his greatest achievements. It was fieldwork that both drew him into the discipline and inspired his shift from archaeology to cultural anthropology. His broad archaeological and ethnographic fieldwork experience included research in the American Southwest, Marquesas Islands (1920–1922), Madagascar (1926–1927), Ohio, Wisconsin, New Jersey, Guatemala, and work with Native American groups, including the Comanche and the Pawnee.

Key Works and Theoretical Contributions

Linton was an important theoretician and an influential teacher, well-known and respected in his time. Several of his works are of note in the history and development of anthropological theory. One of Linton's early essays made a salient point about the fundamental similarities in the beliefs and practices of "modern" Europeans and Americans and those of the members of "primitive" societies who were the most frequent object of anthropological inquiry. In "Totemism and the A.E.F.," Linton drew on his experience in the Rainbow Division of the American Expeditionary Forces during World War I. He described how the rainbow insignia became a totem for the soldiers in the division, outlining how it took on sacred and supernatural powers. This was an important insight at the time, and a contribution to the more reflexive anthropology that would follow.

Linton attempted to take what he considered the best elements from each competing theoretical

school of the time to construct an encompassing and synthetic theoretical approach. He did not position himself in any one school, but rather proclaimed his willingness to accept some, but not all, of the central propositions of each. In *The Study of Man* (his best known single work), he sought to outline this encompassing paradigm and to apprehend the relationship between the psychological functioning of individuals and the suprapersonal dimensions of culture.

The Study of Man was not only a theoretical but also a historical synthesis. The text begins with human origins and seeks a basic explanation of contemporary cultural diversity. In doing so, Linton examined the concept of race, critiqued its popular usage, and showed that it lacked empirical validity. He subsequently moved to explain variations in social organization through a theoretical integration of diffusionist, evolutionary, historical particularist, functionalist, psychological, and humanistic perspectives. One challenging aspect of the text is its near complete lack of citations and footnotes—Linton maintained some unconventional views of such scholarly conventions. Nevertheless, one can see connections between his grand synthesis and the ideas of his contemporaries. Interestingly, he seemed to want to integrate most thoroughly the schools of two contemporaries with whom he had significant personal animosity—Boas and Radcliffe-Brown. Linton proposed a typology of the different forms, meanings, uses, and functions of cultural elements. He believed that this typology could take account of the ultimate functions of cultural elements, while also being sensitive to social and cultural change, and the diffusion of particular practices and tools. He further added to this synthesis what he saw as a more sophisticated treatment of the psychology of individuals, which he argued that key players were ignoring or mistreating in each school.

Status and Role

One chapter in *The Study of Man* has been widely cited in anthropology and sociology for its contribution to our understanding of social systems. In "Status and Role," Linton lays out several important distinctions regarding specialization in society. A status is a particular place or position within a social organization, such as the status of "father" or "neighbor." A role, however, constitutes the attitudes, values, and behaviors that each person occupying a particular status carries out (what Linton termed the *dynamic* aspect of inhabiting a status). While statuses and roles are linked, they are experienced as distinct by individuals. Statuses are experienced as structural placements within a social system, while roles involve what has to be learned by an individual in order to effectively carry out and validate their placement in the social order. The other important distinction that Linton makes here is the difference between achieved status (status based on one's activities) and ascribed status (status based on one's inherent characteristics at birth), and he explicates the varying conditions in which a status may be either achieved or ascribed.

Culture and Personality

Linton is often identified with the "culture and personality school." What is interesting is that the cultural essentialism that modern anthropologists often assume characterizes that the "school" is not inherent in the assumptions or the explicit treatment of individual variation in Linton's writings. Linton's descriptions of ascribed versus achieved status, as well as his subsequent concept of status personalities, seek to take stock of the extensive individual psychological variation within social systems. Robert LeVine describes how the contemporary disciplinary myth about the Culture-and-Personality school incorrectly assumes that these theorists believed the relationship between personality and culture was relatively unproblematic (i.e., personality writ large) and that culture exerted its influence more or less uniformly across the personalities that it shaped. Linton explicitly rejected these ideas, and his writings in the early twentieth century have a strikingly modern feel. He ruminated about the dangers of essentialism (though he does not use this term) and considered the complex philosophical issues at stake in simplistic cultural representation. He wrote about the variety of ways that anthropologists ought to take individual variation into account, arguing that some dimensions of psychological function can indeed be independent from cultural fashioning and that culture surely exerts differential pressures on varying subgroups within each society (male and female, different classes and castes, age groups, etc.).

Disciplinary entrenchment was increasingly important in the academy when Linton began his

career. He became an important figure in calling for the transcendence of these boundaries to deal with interesting investigations of the human condition without regard to what he considered superficial divisions. From his time at Wisconsin to his chairmanship at Columbia, he participated in joint seminars and initiatives to promote cross-disciplinary teaching and research. One of the best known of these efforts was the joint seminar that he held with Abram Kardiner. In this seminar, Kardiner would bring psychoanalytic interpretation to ethnographic presentations made by anthropologists. Kardiner's work included analyses of Linton's material on Comanche, Tanala, and Marquesan culture. Other presenters at the seminar included Cora DuBois, Carl Withers, Charles Wagley, and Francis L. K. Hsu.

Kardiner's melding of psychoanalysis and ethnographic material had far-reaching influence, and a number of notable publications came of the seminar, including Linton's 1945 book, *The Cultural Background of Personality.* This work can be seen as Linton's attempt to refine some of the efforts to integrate psychological function with particular cultural patterns that were typical of the seminar, as well as a refining of his own arguments in *The Study of Man.* For example, he proposes the "status personality" as a concept that can integrate a functionalist understanding of social configurations while still accounting for variations from the "basic" or "modal" personality types in a given society. Status personalities are personality configurations specific to the interactions of people in particular positions in the social configuration. This allowed for a diachronic dynamism not inherent in Kardiner's formulation, as well as an understanding of more extensive variation in the types of personalities that were seen as distributed across a cultural group.

Linton's Legacy

Ralph Linton died of a heart attack in 1953. He was actively writing and lecturing at the time of his death, which is evidenced by the posthumous publication of two books, *The Tree of Culture* in 1955 and *Culture and Mental Disorders* in 1956. The former was approximately two thirds completed at the time of his death and was completed by his widow. *The Tree of Culture* included a more comprehensive historical synthesis than *The Study of Man*, which was more theoretical. *Culture and Mental Disorders* was based on a set of interdisciplinary seminars at Yale and was edited and published by George Devereaux.

Linton's footprint on the discipline of anthropology can be seen in the way that he synthesized important observations from competing schools of thought into a coherent approach, developed a theoretical framework that could account for both macrosocial patterns as well as idiosyncratic psychological factors (the enduring central concern of contemporary psychological anthropology), and in the ways that he communicated these ideas to both popular and specialized audiences through his lectures and writings. He fashioned a more reflexive discipline and drew from a wealth of ethnographic and archaeological experience to push forward a grand synthesis of understanding the human condition for social scientists and the general public alike.

London School of Economics

London School of Economics (LSE), formally known as the London School of Economics and Political Science, is a research institution of higher education in the United Kingdom.

History of the LSE and the Tradition of Anthropology at the School

The LSE specializes in the social sciences, offering graduate programs in all traditional disciplines. Organizationally, it is a school of the University of London. As a distinct entity, the LSE has played a significant role in the institutional development of anthropology in higher education, most notably in Britain. Formative anthropologists, theorists, philosophers, and intellectual figures serving on the faculty of the school, either on a permanent or a visiting basis, full-time or part-time, have included Edward Westermarck, Charles Gabriel Seligman, Bronisław Malinowski, Raymond Firth, Lucy Mair, Audrey Richards, I. Schapera, Sir Karl Popper, Maurice Bloch, and Dan Sperber. Former LSE students who have gone on to make significant contributions to anthropological theory include E. E. Evans-Pritchard, Meyer Fortes, Edmund Leach, Hilda B. Kuper, and Jean and John Comaroff.

The LSE was founded in 1895, having socialist origins as an intellectual endeavor of the Fabian Society. Beginning in 1900, formal courses were offered at the school, with degrees conferred from the year 1902. By 1904, the LSE had fully joined the University of London as one of its schools, at which time degrees were awarded by the university. At that time, the school had an enrollment of more than 1,400. The school's students were instructed by an academic staff of more than 40 lecturers.

As an academic teaching and research area, ethnography and social institutions were historically grouped together at the school, and the director, Lord William Beveridge, expressed interest in prioritizing the expansion of this academic area in these earliest years of the institution's history. Expansion of the area's resources took place under the direction of the Finnish philosopher and sociologist Edward Westermarck and later under the leadership of the pioneering ethnologist Charles Gabriel Seligman. In the early years of the LSE, academic departments did not exist. In fact, for the most part, the school did not have formal academic departments until the 1960s. It has been said that the word *department* was taboo in the early history of the school and that only when enrollment numbers soared did the LSE find it necessary to accommodate students in academic departments. Rather, for a great part of its institutional history, certain subjects were taught for credit as course requirements in the LSE's syllabi of degree programs.

In the 1920s and 1930s, a priority at the school was to keep all the social sciences under one roof. Another institutional goal was to enhance the offerings in the social sciences. To broaden the offerings of the social sciences in the school's degree catalog of syllabi, the senior leadership decided to expand the courses in anthropology. This included the creation of a formal graduate program with significant additional resources.

The Anthropology Faculty and Its Notable Students

Since departments did not exist in the early years of the school, faculty posts were structured around certain courses and subjects in the school's degree syllabi. Westermarck started lecturing in anthropology in 1904. He remained on the faculty at the LSE as a part-time professor until 1930. The year 1913 marked the creation of the first faculty post in ethnology, to which Seligman was appointed. Although this appointment was permanent, it was only part-time. Seligman had already been appointed to a lecturer's post in ethnology in 1910.

By 1927, the school had created its first full-time professorship in anthropology, to be held by Malinowski. Offered a scholarship that was arranged with the help of Seligman's leadership, Malinowski had become a student at the LSE in 1910 and had studied with Seligman and Westermarck. The school awarded him a DSc in 1913, and he began lecturing

at the school, taking on students alongside his teachers Westermarck and Seligman. The school formally elected him a social anthropology readership in May 1923, which commenced in 1924.

Malinowski's faculty post in social anthropology at the school was in part made possible by significant funding from the Rockefeller Foundation. The anthropologist Jack Goody has argued that by insisting that the faculty position carry the title of Social Anthropology rather than Cultural Anthropology, Malinowski and the LSE hoped to distance themselves from their institutional neighbor University College London. This gave the school a distinct reputation in British anthropology that was rivaled only by nearby Oxford University. By the end of the 1920s, Malinowski had attracted a group of formidable scholars to the LSE to carry out graduate studies under his direction.

By 1925, Evans-Pritchard and Firth had joined the anthropology graduate program, followed by Schapera a year later. The first of Malinowski's PhD students was Firth, who was awarded his degree in 1927. Evans-Pritchard, Fortes, and Max Gluckman all studied with Malinowski at the LSE prior to transferring to Oxford to study under A. R. Radcliffe-Brown. Firth, Richards, Leach, and Schapera kept LSE their primary academic affiliation in research and fieldwork dating from that time period. Monica Wilson was one of the students attending Malinowski's LSE seminars. Hilda B. Kuper was a full-time PhD student of his at the school.

Structural functionalism had become the mainstay at Oxford with Radcliffe-Brown's commanding presence there. The LSE emerged as its rival institution in British social anthropology, serving in part as Malinowski's mouthpiece for articulating a more implicit form of functionalism, one that was not structural in its theoretical foundations and did not depart as much from early intellectual figures such as Herbert Spencer and Auguste Comte as that promoted by Radcliffe-Brown. Malinowski died in 1942, and in 1944, his chair was given to Firth, thus continuing Malinowski's tradition in anthropology. During Firth's tenure, the school enhanced its theoretical reputation in anthropology. His faculty appointment at the school was followed by teaching posts for Schapera and Mair. This trio of scholars became a fixture in the school's anthropology department in the succeeding years.

The Anthropology Graduate Program and Its Resources

Malinowski had been successful in developing a formal graduate program in anthropology at the LSE in the years following the First World War. The program peaked in the 1930s and then rose to prominence again in the 1950s. The LSE received significant funding from the Rockefeller Foundation from 1923 to 1939. In addition to funding students, the institution also used the money to help finance the expansion of its library, its buildings, professorships, research projects, and overseas travel to the United States for professional purposes. Among the University of London community of schools and colleges, the LSE gained the reputation of preferring additional faculty resources and professorships to the expansion of school buildings. Nevertheless, the LSE soon housed the largest social science research library in Britain. Today, the British Library of Political and Economic Science at the LSE is one of the institutional legacies of funding by the Rockefeller Foundation in the 1920s and 1930s.

Theory at Other Departments of the School and the Next Generation of Anthropology

Shortly after publishing his treatises *The Poverty of Historicism*, which were writings dating from 1930, and *The Open Society and Its Enemies*, the eminent philosopher Sir Karl Popper arrived at the LSE in early 1946. Popper took up a full-time academic position; served as the founding figure of the LSE's Department of Philosophy, Logic, and Scientific Method; and 3 years later was appointed professor of logic and scientific method. He held this faculty post until 1972. Primarily because of Popper's early achievements, the LSE gained a reputation as a leader in the philosophy of the social sciences. Popper's research, teaching, and scholarly influence after arriving at the school were primarily in the philosophy of physics, philosophy of science and methodology, and history of science. The department continues today to attract leading faculty.

Jean and John Comaroff, today editorial affiliates of the highly influential journal *Public Culture*, were both students in the Department of Anthropology's graduate program. John Comaroff earned his PhD from the LSE in 1973, and Jean Comaroff was awarded the same degree the following year. There

was a group of South Africans in the school's anthropology department, and they were represented by the Comaroffs. Soon after the Comaroffs departed, the emerging interdisciplinary field of contemporary cultural studies was embraced by the school. The prolific contemporary cultural studies scholar Scott Lash earned his PhD in 1980 from the school's Department of Sociology.

As a faculty member in the Department of Anthropology for the major portion of his career, Maurice Bloch generated theoretical works that stemmed from and engaged structuralism and the French Marxist traditions. The works also had implications for, and relied on, developments in cognitive science. Another notable scholar who had employed cognitive science in his theory construction, Dan Sperber, arrived at the LSE in 1988 as a distinguished visitor. He returned as a visiting professor in the late 1990s through the 2000s, most of the time sponsored by the Department of Anthropology.

The LSE in Recent Years: Contemporary Theorists and Their Contributions

The leading contemporary sociological theorist Anthony Giddens served as director of the school from 1997 to 2003. Under his leadership, the school's Department of Sociology grew to greater prominence. This was especially the case in its theoretical orientation to critical and cultural studies, particularly in contemporary social and political issues. Most visible was his case for advances and dialogues in globalization theory.

The vocal sociologist Ulrich Beck has become a mainstay at the LSE Department of Sociology in recent years. He teaches graduate social theory courses to students enrolled in programs there. His research on the theoretical aspects of modernity received significant attention. His arrival further raised the profile of the school's sociology department.

The field of urban studies has emerged in recent years at the LSE. For the most part, this has been made possible through funding for a research project on cities undertaken by the school's Department of Sociology. The department has welcomed the urban sociologist Saskia Sassen, originator of the term *global city*, as a recurring centennial visiting professor in recent years. It has also housed other leading scholars devoted to urban studies in their theoretical constructs.

The highly respected sociologist Craig Calhoun took over as director of the school in September 2012. A cultural sociologist and theoretician, Calhoun served as founding director of the Institute for Public Knowledge at New York University prior to his arriving at the LSE. He had also been president of the Social Science Research Council. For a number of years, Calhoun had worked with the LSE's eminent sociologist Richard Sennett in the cofounding of a research consortium consisting of New York- and London-based graduate students focusing on incorporating ethnographic, historical, and other qualitative methods into their research in the social sciences. Under Calhoun and Sennett's direction, the students in the consortium brought these methods to light in their work encompassing cultural, social, and political themes, for which the LSE had gained an international reputation in the 1990s and 2000s.

The famed cultural studies figure Paul Gilroy joined the faculty of the LSE Department of Sociology as inaugural Anthony Giddens Professor of Social Theory prior to Calhoun's arrival at the school. A product of the Centre for Contemporary Cultural Studies at the University of Birmingham in Britain in the early 1980s, Gilroy was a PhD student of the formative cultural theorist Stuart Hall. He was a vocal advocate of British cultural studies at the school. This tradition was pervasive in the course offerings at the Department of Sociology and within a number of the school's interdisciplinary research clusters prior to Calhoun's arrival.

Lounsbury, Floyd

Floyd Glenn Lounsbury (1914–1998) was an American linguist and anthropologist known for contributions to the anthropology of kinship relations, ancient Mayan hieroglyphic writing, and the linguistics of Iroquoian languages. Along with Ward Goodenough, Lounsbury was a foundational theorist in the "new ethnography," or "ethnoscience," a formal approach to the analysis of cultural systems from the perspective of native categories, as represented in lexical semantics of language.

Biography

Lounsbury was born in Stevens Point, Wisconsin, on April 25, 1914, to John Glenn Lounsbury and Anna Louise Jorgensen Lounsbury. He completed his undergraduate degree in mathematics at the University of Wisconsin. During that time, he also took courses in anthropology and linguistics from several noted scholars, including Einar Haugen, Morris Swadesh, and Freeman Twadell. Swadesh hired Lounsbury as an assistant in his Oneida language project, funded by the Works Progress Administration, which Lounsbury himself led from 1939 to 1940 after Swadesh moved to Mexico. He completed his research and wrote his master's thesis on Oneida phonology using the data gathered from the project. Like many scholars of the time, Lounsbury's work was interrupted by the outbreak of World War II. After 4 years of military service, Lounsbury formally completed his master's degree at the University of Wisconsin in 1946 and received a Rockefeller grant to carry out his doctoral studies in anthropology at Yale University, where he studied with Bernard Bloch. His dissertation, *Iroquoian Morphology*, was finished in 1949 and published in 1953 as *Oneida Verb Morphology*. On graduating, Lounsbury took a faculty position in anthropology at Yale, where he remained until retiring in 1979. At the time of his death in 1998, he held the title of Sterling Professor Emeritus of Anthropology at Yale University.

Major Contributions

Lounsbury contributed to several different fields. His most significant contributions, however, have been in Iroquoian linguistics, kinship, and the decipherment of Mayan hieroglyphics.

Iroquoian Linguistics

Much of Lounsbury's later contributions to anthropological theory and to the decipherment of Mayan hieroglyphic writing can be related to his formative training in the rigorous and systematic approaches of mathematics and descriptive linguistics. His master's thesis and doctoral dissertation on Oneida continue to be standard reference material for Iroquoianists today, most of whom were mentored by Lounsbury. In his work on Iroquoian phonology and morphology, Lounsbury developed much of the descriptive framework and terminology for describing Iroquoian languages.

Kinship

Lounsbury is perhaps best known for his application of the methods of componential analysis—pioneered in linguists for the study of the sound systems of language—to kinship. In an influential article published in the journal *Language* in 1956, Lounsbury explained how the terms used in the Caddoan language Pawnee to talk about kinship relations could be systematically analyzed in terms of individual components of meaning to discern the underlying organizing distinctions, the system of kinship. The basic method was to gather a comprehensive list of words used in a language to refer to kin relations and then to define each item in terms of a fairly small but theoretically universal set of contrastive features (parallel to the place and manner of articulation and voicing in phonology). The system of meaningful distinctions for a given language can be inferred from the feature contrasts that are lexicalized (expressed with different words) in the language and those that are not. The method he laid out was rigorous, methodical, and—as he showed in subsequent articles on L. H. Morgan's

"Omaha"- and "Crow"-type kinship systems, and others—readily applicable to any group.

Lounsbury's systematic, empirical approach attracted linguists, who were struggling to investigate language meaning with the same methodological rigor that had been achieved in post-Bloomfield structural linguistics in the realm of phonology and morphology. It also appealed to anthropologists as it seemed to bridge the space between the systematicity of language and other, seemingly less structured cultural patterns and behaviors. Lounsbury's work also complemented the work of fellow Yale graduate Ward H. Goodenough, whose "Componential Analysis and the Study of Meaning" appeared in the same 1956 issue of *Language* as did Lounsbury's study of Pawnee kinship. Both Lounsbury and Goodenough emphasized a systematic, empirical approach to the study of society that sought to define, primarily on the basis of lexicon, the indigenous categories and structures according to which a given society organized the world. Both their methods and their goals have been important in the "new ethnography," ethnoscience, and in cognitive anthropology.

Mayan Hieroglyphics

Lounsbury's characteristic analytical rigor can also be seen in his contributions to ancient Maya hieroglyphics. He was an early proponent of looking to the Mayan languages to understand hieroglyphs and was among the first American scholars to see the value of the work on phoneticism in Mayan hieroglyphics by the Russian Yuriy Knorosov. Lounsbury advocated investigating Mayan hieroglyphs as language rather than as abstract representations of ethereal ideas, and he introduced a new degree of rigor into the methods of decipherment, which at the time were fairly loose and slipshod. Lounsbury became interested in Mayan hieroglyphics in the 1960s, but he was particularly active in efforts to decipher Mayan hieroglyphic writing during the 1970s and 1980s. In addition to contributing specific proposed decipherments and interpretations of texts, especially at Palenque, and introducing more rigorous methods for formulating and testing hypotheses about glyphic readings, Lounsbury also contributed to the understanding of ancient Mayan numeration, mathematics, and astronomy. He published work on the "Venus tables" in the Dresden Codex and addressed and resolved several issues with specific distances numbers and calendric cycles in various inscriptions. He also wrote an important summary of the current state of the art in Mayan numeration and calendrics.

Lowie, Robert

Robert H. Lowie (1883–1957) was born in Vienna to a German-speaking Jewish father born in Hungary and a Viennese Jewish mother. When he was 10, his family immigrated to New York, where he grew up as a bilingual youngster in a middle-class German Jewish intellectual milieu. Lowie retained his bilingualism and his European (and specifically Viennese) cultural tastes and habits for the rest of his life. In 1897, he entered City College, concentrating first on Greek and Latin and later on science. On graduation, Lowie taught in the New York public schools for 3 years and then enrolled in a graduate program in anthropology at Columbia University. His main mentor, Franz Boas, had a major influence on him as a scholar. However, he was just as much a student of Clark Wissler, his supervisor at the American Museum of Natural History, where Lowie worked as a volunteer while still in graduate

school. It was Wissler who sent him on his first ethnographic field trip to the Lemhi Shoshoni in 1906. In 1908, on completion of a thesis dealing with comparative mythology, Lowie received his PhD degree and continued working as a curator at the American Museum of Natural History until 1917.

As both an undergraduate and a graduate student, Lowie was very interested in the history and methodology of science and was a particularly devoted follower of the Austrian philosopher Ernst Mach, with whom he corresponded. He shared these interests with several other members of the first cohort of Boas's graduate students, especially Alexander Goldenweiser and Paul Radin. He also shared their literary tastes and political orientation. During his New York years, Lowie espoused socialist ideas and supported various left-wing and liberal causes, including socialism and feminism. His articles and book reviews appeared in publications such as *The Masses*, *The Freeman*, *The Liberal Review*, *The Dial*, *and The New Republic*. However, once he became older and settled in California, Lowie moderated his political views, while remaining a liberal for the rest of his life.

His move from the East to the West Coast was made possible by A. L. Kroeber, another early student of Boas, who founded the anthropology department of the University of California, Berkeley. After teaching there as a visitor for a few years in the late 1910s, Lowie was promoted to full professor in 1921 and remained on the faculty of that department until 1950. He and Kroeber taught several generations of (mainly graduate) students, taking turns chairing the department, while the more junior faculty members taught the undergraduate courses. Lowie was never considered a charismatic teacher, but his students did receive a thorough grounding in world ethnography and the history of anthropology, while his command of ethnographic literature was considered to be truly encyclopedic. He was also widely admired by students and colleagues for his genuinely courteous manners and generosity of spirit.

Lowie was highly respected in his profession. For 9 years (1923–1931), he was the editor of the *American Anthropologist*. He also served as president of the American Folklore Society in 1916, the American Ethnological Society in 1920, and the American Anthropological Association in 1935 and was elected to the National Academy of Sciences. After retiring in 1950, Lowie was much in demand as a visiting lecturer in the United States and abroad.

In 1933, Lowie married Luella Cole, who became his closest friend and traveling companion. During World War II, Lowie taught courses on German culture and European ethnography, and this experience plus his own background stimulated his interest in writing a book, *The German People* (1945). After the war, accompanied by his wife, Lowie carried out ethnographic research in Germany, using the data from it for his book *Toward Understanding Germany*, published in 1954. In both of these works, he tried to avoid the superficial theorizing typical of many of the "national character" studies of that era.

Lowie's main ethnographic works dealt with the Crow Indians of the Great Plains, whose culture he studied over many years. He also conducted ethnographic research among the Shoshoni, the Ute, the Hidatsa, the Mandan, the Arikara, the Washo, and the Hopi. In addition, he studied several South American Indian cultures from a distance, using data provided by local ethnographers. Lowie developed good rapport with his Native American consultants, all of them elderly men and women whom he meticulously interviewed about the "old culture" of their own younger days as well as that of their parents and grandparents. Hence, along with most of the other Boasians, he was a strong advocate of *salvage anthropology*, a term some scholars actually attribute to him.

Most scholars agree that Lowie's contributions to anthropological theory were not as significant as those of the more brilliant Boasians such as Edward Sapir, Radin, Goldenweiser, and Kroeber. However, a number of his books and articles did make an impact on the discipline at the time of their publication, and some have continued to do so long after. His general theoretical orientation can be described as "mainstream Boasian." Like his mentor, Lowie emphasized cultural relativism as opposed to Victorian social evolutionism. His books *Primitive Society* (1920) and *Primitive Religion* (1924) established him as the main opponent of evolutionism in American anthropology, while his 1929 brochure *Are We Civilized?* questioned the common assumption that technological and economic progress inevitably lead to moral progress.

Generally speaking, Lowie was a dedicated empiricist and positivist who viewed cultural anthropology as a science—trusted facts—and mistrusted any

theorizing that he viewed as unsubstantiated. Many of his specific theoretical positions can be characterized as middle-of-the-road. Thus, for example, on the question of the correlation of semantic categories in kinship terminologies, on the one hand, and social organization and behavior, on the other, he advocated a position in between American historical and British functional ones. Similarly, while he was sympathetic to some of the arguments put forward by the proponents of the theory of cultural diffusion, he rejected their more radical speculations. When it came to the relationship between psychology and anthropology, Lowie argued that the former was a study of the innate behavior, in contrast to the learned behavior, of culture. At the same time, he suggested that mythology and religion have common elements across cultures, which might have been derived from dreams, and that these dreams may have some sort of biological basis (*History of Ethnological Theory*, 1937). He did not trust the Freudian generalizations of the early culture and personality studies.

Not surprisingly, some of Lowie's most original contributions to anthropological method and theory can be found in his studies of specific ethnographic cases rather than in his general works. For example, the historical and comparative summaries at the end of his work on Plains Indian age societies (1916) were praised even by the most empirically oriented Boasians. They are among the best examples of the kind of comparative and historical interpretation produced by that school. It is this work that had a major impact on the American historical tradition of kinship studies spearheaded by Fred Eggan, the British functional approach to kinship and social organization, and even the work of Claude Lévi-Strauss on the same subjects.

Lubbock, John

Sir John Lubbock (1834–1913), Lord Avebury, an English avocational archaeologist, naturalist, banker, and member of parliament, was a close associate of Charles Darwin and a leading evolutionist of the 19th century. He was the eldest son of a London banker who was also the treasurer of the Royal Society. The Lubbock estate neighbored Downe village in Kent, where Charles Darwin lived, and Darwin encouraged the young aristocrat's interest in natural history. Lubbock's principal scientific work was in entomology under Darwin's direction. He also worked closely with the geologist Charles Lyell and the biologist Thomas Henry Huxley, who promoted his membership in leading English scientific societies. Lubbock was also deeply interested in archaeology and visited the well-known sites of his day with leading prehistorians such as Joseph Prestwich and John Evans. Lubbock's descriptions of these sites in his 1865 book *Pre-Historic Times, as Illustrated by Ancient Remains, and the Manners and Customs of Modern Savages* helped build his reputation as one of the leading proponents of human antiquity in Victorian England.

Lubbock finished his education at Eton at the age of 14 and immediately became active in his family's banking business. In his 30s, he ran for parliament and was elected in 1870. As a member of parliament, his greatest achievements were to legislate banking holidays and shorter working hours, and for protecting archaeological sites through the Ancient Monuments Act of 1882. In 1879, Lubbock was elected first president of the Institute of Bankers, and from 1881 to 1886, he served as president of the Linnean Society. Lubbock also received honorary degrees from Oxford, Cambridge, and the University of Edinburgh, and in 1878, he was made a trustee of the British Museum. In 1900, Lubbock was made a peer and took the title Lord Avebury from the important henge monument he purchased in 1871 to save it from destruction.

In *Pre-Historic Times*, Lubbock attempted to prove human antiquity and create a picture of the lives of Stone Age humans. He did this, as one can tell from the book's full title, using archaeology and the 19th-century theory of the comparative method, especially the notion that modern indigenous people were a window into earlier stages of human society. In addition to archaeological reports, Lubbock made full use of ethnographic descriptions of the "primitive" people of his day, such as Australian aborigines, Native Americans, and the people of Tierra del Fuego. However, rather than starting in the prehistoric past and working forward, Lubbock's book moves backward in time, with a focus on archaeological excavations, starting with the Bronze Age through the Alpine Lake dwelling sites in Switzerland to the Somme River gravel beds excavated by the French archaeologist Boucher de Perthes, where Acheulian hand axes were first discovered. Additionally, in *Prehistoric Times*, Lubbock coined the terms *Neolithic* and *Paleolithic* as subdivisions of Christian Thomsen's three-age system of Stone, Bronze, and Iron Ages.

In 1870, Lubbock published *The Origin of Civilization and the Primitive Condition of Man*. Whereas Lubbock's purpose in *Prehistoric Times* was to study archaeology and the "primitive" people of his day in order to understand more accurately the culture of ancient peoples, *The Origin of Civilization* set out to describe the social and mental condition of "savages." He argued that there were three principles to be emphasized in the study of the "lower races": first, that savage cultures resemble those of our ancestors from long ago; second, that such cultures include customs that no longer have present utility but are rooted in our minds like fossils in soil; and, third, that studying aboriginal peoples shed some light on the future. Following Henry Main's *Ancient Law* (1861) and E. B. Tylor's *Researches Into the Early History of Mankind and the Development of Civilization* (1865), Lubbock's book was strongly evolutionist in tone, tracing the evolutionary history of art, marriage, religion, morality, language, and laws from their first appearance in savagery to their culmination in modern Europe.

In many ways, Lubbock's books, in particular *The Origin of Civilization*, encapsulate the main themes of English evolutionary thought in the mid-19th century so typically associated with Tylor and Lewis Henry Morgan. First, there is the belief in unilineal evolution—that all societies were evolving in the same way. This parallel evolution is driven by psychic unity—a principle first enunciated by Adolf Bastian. Bastian argued that because all humans share biologically similar brains, all will share similar elementary ideas and therefore when confronted with similar problems will solve them in similar ways. The implication of cultural evolution and psychic unity was that cultures were simply at different places in their progress up the evolutionary ladder. Lubbock's ethnographic reporting described the many cultural parallels found in savage societies around the world and the "fossils" of those practices that remained in modern society. His archaeological writings pointed out these parallel developments through time, demonstrating the similarities between the lives of modern savages and the materials revealed in the archaeological excavations of his day.

Lubbock was famous in his day and widely known for his writings on various topics in biology and natural history. *Prehistoric Times* was a popular archaeology text and went through seven editions by the time of Lubbock's death in 1913. Today, however, Lubbock's legacy has been eclipsed by that of Tylor and Morgan. He is primarily remembered today in anthropology as one of the founders of prehistoric archaeology.

Lyotard, Jean-François

Jean-François Lyotard (1924–1998) was a French intellectual and philosopher. Although most commonly associated with postmodernism, he was also an important part of the French poststructural movement. He is best known for his critique of modernity and for his view of reality as a fragmented ensemble of complex events that cannot be represented or interpreted accurately. Although Lyotard's work has been extremely influential in social and cultural anthropology, it spans several other realms, including philosophy of language, psychology, ethics, political philosophy, and aesthetics. Mirroring this diversity is Lyotard's engagement with a number of eminent thinkers: Immanuel Kant, G. W. F. Hegel, Karl Marx, Sigmund Freud, Martin Heidegger, Jacques Lacan, Gilles Deleuze, and Jean Baudrillard, to mention a few. This entry offers a brief biography followed by a discussion of some of Lyotard's fundamental ideas and his work *The Postmodern Condition*, concluding with some critiques and comments on his legacy.

Biography and Major Works

Lyotard was born in Vincennes in 1924. After graduating from the Sorbonne in philosophy and literature, he taught philosophy in a number of schools, including one in Constantine, Algeria, where he experienced firsthand the conflict between Algerian workers and the French oligarchy. In 1948, he married Andrée May, with whom he had two children, Corinne and Laurence. In 1993, he married his second wife, Dolorès Djidzek, with whom he had a son, David.

In 1954, Lyotard joined the Marxist Trotskyte group Socialisme ou Barbarie (Socialism or Barbarism) and was a contributor to the journal *Socialisme ou Barbarie*. In 1964, due to internal discord, he joined the splinter group Pouvoir Ouvrier (Workers' Power), until 1966, when he also resigned from his academic post as assistant professor at the Sorbonne. Around that time, he took up a position in the philosophy department of the University of Paris X (Nanterre) and, despite his loss of faith in Marxism, participated in the May 1968 student protests against the government. Eventually, Lyotard's critique of Marxism was outlined in *Libidinal Economy* alongside his critique of capitalism. Arguing that both systems are intertwined with libidinal forces—irrational desires and impulses underlying a multitude of events that are exploited by economic structures—Lyotard concluded that Marxism's "truth" is no better than the "truths" it criticizes, while acknowledging that libidinal forces potentially have the power to destabilize and transform these structures.

Lyotard's academic career reached new heights as a professor of philosophy and languages at various distinguished institutions, including the University of Paris VIII (Vincennes), where in 1978 he became professor emeritus; the University of California; and Emory University. He was a visiting professor at several universities around the world, including the University of Montreal, Quebec, Canada; the University of Saõ Paulo, Brazil; and the University of Siegen, Germany. Between 1968 and 1970, he was in charge of research at the National Centre for Scientific Research in Paris. In 1983, with Jacques Derrida, Gilles Deleuze, and others, he cofounded and was one of the presidents of the International College of Philosophy in Paris. Lyotard died of leukemia in Paris in 1998.

Lyotard's most famous books include *Phenomenology* (1954), *Discourse, Figure* (1971), *Libidinal Economy* (1974), *Au Juste: Conversations* (*Just Gaming*, 1979), *The Postmodern Condition: A Report on Knowledge* (1979), *The Differend: Phrases in Dispute* (1983), *The Inhuman: Reflections on Time* (1988), *Peregrinations: Law, Form, Event* (1988), *Lessons on the Analytic of the Sublime: Kant's Critique of Judgment* (1991), *Political Writings* (1993), and *Postmodern Fables* (1997).

Some Fundamental Ideas

In *Discourse, Figure*, Lyotard critiques structuralism, to which he relates "discourse" (written text), a form of cognitive communication that he juxtaposes with "figure," the potentially subversive product of the senses (phenomenology). These two categories are not simply opposites; they are intertwined. Despite the fact that discourse has historically dominated, it has been inadequate in representing historical events as well as the *sublime*, a concept that Lyotard adopted and modified from Kant to include

not only the "transcendentally great" but also anything that we as humans are incapable of representing or fully grasping.

These ideas are tied to Lyotard's important anthropological insights. First, he challenged the notion of the "subject" as the central, rational entity of modernity, suggesting instead that it is as fragmented as reality itself. Second, in later works, for instance, in *The Inhuman*, these ideas gave rise to his notion of humanism, where, influenced by Lacan and Freud, he disputed the idea of human nature as the essence and argued that humans are not born human and that this inherent inhumanness never leaves us completely—in contrast to teleological interpretations that interpret the unhuman as only the initial stage of the life cycle.

Furthermore, as Veronica Vesterling notes, Lyotard's humans are permanently afflicted by high levels of "affectability" or sensitivity to external events, thus remaining finite and vulnerable in the universe, unable to express the sublime. In contrast to Kant, Lyotard does not believe that rationality compensates for the failure of the senses and imagination; moreover, what our imagination cannot grasp should not be suppressed or hidden. The only exception to humanity's inability to express the sublime are subversive and disruptive forms of "avant-garde" art, a realm at the periphery of society sufficiently detached from established language games, hence free of the prejudices and limits imposed by reason and convention. "Good art" is not about faithful representation or about harmony between form and contents as modernity would have us believe. It is not even about new ways to represent. For Lyotard, it is about discovering the limitations of representation and unmasking the unpresentable: Art becomes an important catalyst for social and political revolutionary change.

Failure to adapt to the world is significant not only in the anthropological sense but also politically. Lyotard built on Wittgenstein's theory of language as something complex, multifaceted, and governed by forces that are neither eternal nor universal.

He regards "language games" as phrases or utterances that carry their own rules—by being incommensurable and heterogeneous, they ensure the fragmentation of discourse. They can be descriptive (knowledge) or prescriptive (action). What phrases are chosen and which ones are silenced are political decisions. Mirroring his idea of the social world as fragmented and diverse, Lyotard's language games are individual expressions of conflicting realities, values, and practices from a range of social areas engaged in a power struggle. Just as there is no narrative superior to any other, there is no language that is higher than any other or capable of resolving conflict between the different language games. The important point is that discourses that are incommensurable should not be forced to speak a common homogeneous language, for that would not be just.

Taking this idea further, Lyotard conceptualized injustice in discourse in *The Differend*, argued by many to be Lyotard's most important book. The "differend" is a situation of unresolved language conflict where victims cannot present the wrong they suffered or their side of the story; the inability to negotiate the unpresentable is part of the notion of the sublime. Lyotard believes that the duty of philosophy is to continuously expose the differend or the misappropriation of language games. The matter of how ideas about reality and justice differ is also explored in *Au Juste*. Lyotard argued that a single "rational rule" of judgment cannot be applied to both parties in a dispute. In postmodernity, it is crucial that we build a system of ethics that includes a willingness to allow others to express their own language games. According to Lyotard, justice in modernity is rationalized by descriptive knowledge and universal preexisting criteria. He argued that it should instead be based on indeterminate reflective judgment, using the Kantian constitutive imagination, where the criteria differ in each case according to its own circumstances. This allows the coexistence of incommensurable and irreducible differences, a situation Lyotard refers to as *paganism*.

The Postmodern Condition (1979)

Arguably, *The Postmodern Condition* is Lyotard's most famous book. It was originally a report commissioned by the Council of Universities of the Quebec government on the status of knowledge in developed countries. It is regarded by many as the guiding text of postmodernism, extending its key ideas from the realm of art to that of sociopolitical and cultural theory. Others regard it as a critique of Jürgen Habermas's appeal to discursive coherence in the public sphere. At a basic level, *The Postmodern Condition* is a book about the effects of technological progress on the nature and role of knowledge. According to Lyotard, in modern advanced societies driven by "performativity" or efficient performance,

knowledge becomes a commodity, a way to power rather than the means to a better life. Knowledge is linked to both science and language in the sense that there is scientific knowledge and narrative knowledge, the latter taking on a variety of forms or language games.

In *The Postmodern Condition*, Lyotard argues that grand narratives or metanarratives, which underpin modernity, have lost credibility. This is the postmodern condition, one of "incredulity towards metanarratives." Grand narratives are stories that set the rules for other narratives and language games by organizing knowledge in universal terms to justify the way things are or to explain the occurrence of important events, whether theological (e.g., the creation of the world) or political (e.g., capitalism). In modernity, Lyotard identifies two grand narratives: (1) the speculative narrative (knowledge is the basis of the progress of human life in the quest for truth) and (2) the emancipation narrative (which makes knowledge the prerequisite for human freedom in the pursuit of justice).

However, loss of faith means that narratives no longer have unifying power—identity and reason no longer play a legitimizing role in the formation of knowledge, values, and institutions. Knowledge is no longer the means to a better society underpinned by universal values. The world dominated by capitalism runs on efficiency and profitability, and these are the standards by which the nature and status of knowledge are determined. At the same time, societies become fragmented and individuals alienated from the networks and bonds they previously relied on. This moral and ethical disintegration has been identified by countless scholars as a problem. What makes Lyotard different is the fact that he thinks that the grand narratives themselves are the problem; thus, it is not a matter of replacing one narrative with another. In other words, consensus, compromise, and cooperation are not the solution, and neither is the forceful imposition of a single narrative. For Lyotard, the answer is small local narratives (*petit recits*) and the maximization of language games to ensure a difference.

Criticisms and Legacy

Lyotard's work, contentious at the best of times, has been condemned as philosophically and politically self-defeating. Can any political or legal system work without universal values and without a unifying vision or compromise of some sort? Another criticism is that the postmodern rejection of the Enlightenment does not take it into account that the rights of minority and exploited groups owe much to the values that emerged from it. Furthermore, in the anthropological sense, there seems to be little acceptance of human limitations, and the obsessive emphasis on diversity denies that humans, at least those who live in the same societies, do have some similarities. Finally, there is the most obvious trap for postmodernism to consider: Loss of faith in grand narratives is itself a narrative.

Despite these critiques, Lyotard's assault on grand narratives has important anthropological and political implications: He does not simply wish to tinker with the political spectrum, he wishes to change the very way in which we practice politics. Politics as we know it needs to shift beyond representation; furthermore, he is not concerned with political parties or ideologies but with a politics where difference is cherished rather than downsized and where small narratives speak about the unpresentable. Yet respect for diversity is not the only legacy: Lyotard's commitment to a sociopolitical system that is just and ethical rescues him from the emptiness of relativism and inspires those who wish to change the world for the better.

Maine, Henry James

Sir Henry James Sumner Maine (1822–1887) has usually been regarded as the most cautious and credible of the Victorian anthropologists. He was praised by students of Franz Boas, such as Robert Lowie, and was honored both as an ancestor of functionalism and as a creator of kinship studies and the anthropology of law by Meyer Fortes and Max Gluckman. He enabled the structural functionalists to focus on legal and social rights and duties rather than on individuals. E. E. Evans-Pritchard considered him a master of the comparative method. Today, however, when kinship studies are at a low ebb and the involvement of anthropology in imperialist enterprises has been for some time under scrutiny, Maine is sometimes viewed as a conservative colonialist whose writings provided a rationale for the British policy of indirect rule.

Maine was born in Scotland. His father was a physician. After a brilliant undergraduate degree at Cambridge, he was appointed there, at the early age of 25, as Regius Professor of Civil (Roman) Law in 1847. In 1852, he became a reader at the Inns of Court in London, and from 1863 to 1869, he served as legal advisor on the Viceroy's Council in India. In 1869, he took up a professorship at Oxford. In 1877, he became Master of Trinity Hall, Cambridge.

Ancient Law

Maine's most famous work was *Ancient Law* (1861), and the best known statement in that book, which became a set text for the Indian Civil Service exams before anthropology was taught in the universities, was this: "We may say that the movement of the progressive societies has hitherto been a movement *from Status to Contract*." The meaning of Maine's famous sentence is not transparent. The "progressive societies" were all to be found in parts of Europe where Greek, Romance, Celtic, and Germanic languages were spoken. Comparative philology, a new science that had developed after Sir William Jones's discovery, around 1780, of the relationship between Sanskrit, Latin, and Greek, indicated that speakers of most European languages and speakers of Persian, Sanskrit, Hindi, and Urdu possibly shared a common "Aryan" or "Indo-European" linguistic and cultural heritage. To Maine, unlike some of his contemporaries, the word *Aryan* had more to do with what we would now call "culture" than with biological race. He believed that there were similarities in the early social history of all Aryan groups, but Indian societies were not "progressive" because irrational, imitative, and cruel elements of Hindu tradition had influenced some aspects of Indian law, particularly concerning caste.

The word *status* in Maine's writings signifies the vesting of certain rights and duties with respect to people and things in corporate entities, specifically kin groups or other collective social bodies, rather than individuals. In *Ancient Law*, Maine examined the significance of status in early Aryan societies, particularly in Rome. In the mid-5th century BCE, when Roman law was codified as the Twelve Tables, the family was the only recognized legal actor, the owner of common property, and its ruling principle

was *patria potestas*: As head of the family, or paterfamilias, the father *alone* acted on its behalf, exercising the power of life and death over his wife, children, slaves, and cattle. He controlled the group's land, which with rare exceptions could never be sold; arranged his daughters' marriages; and bought and sold property, such as slaves, daughters, horses, and cattle. Such sales involved a formal conveyance, a literal handing over of goods in exchange for currency, accompanied by the striking of brass scales and the utterance of precise verbal formulae, and demanding the presence of vendor, purchaser, and at least five witnesses.

Family membership normally descended from the paterfamilias to his male children. A woman could not inherit property. On marriage, she passed from the *manus* ("hand," i.e., power, control) and lineage of her father to that of her husband, and her children were his *agnates*—born into (*ad-nati*) his lineage, not the lineage of her birth. Adoption, one of the first *legal fictions*, permitted an extension of the group of agnates to include nonbiological kin. The Roman *gens* or patrilineage was thus an extension of the family principle, and ultimately the city state or commonwealth was built, at least theoretically, on the same model. The family and the *gens* were economic, political, and jural institutions. Later, when he read *The Ancient City* (1864) by Fustel de Coulanges, Maine affirmed that ancestor worship sustained the *gens*.

In *Ancient Law*, Maine traced the slow decline of *patria potestas* and the development of individual legal rights in the 950 years following the Twelve Tables. That period included the transformation of Rome from a homogeneous, rural market town to the hub of the Roman Empire.

According to Maine, by the latter years of the republic, marriages *sine manu* (without *manus*) were beginning to supplant the older forms. During the days of the empire, women who were not traditionally married gained rights to own and sell property but not to participate in public life. Before the end of the republic, the rights of fathers to punish their children were restricted. Sons were given limited rights of property ownership. While theoretically all citizens were affiliated at least fictionally to the traditional patrilineages (*gentes*), shared territory rather than kinship became the real rationale of the state. Individual ownership of movable property became much more common. Citizens who were not family heads could do business with each other, utilizing new, simplified forms of contract developed by officials such as the *praetor peregrinus*, who sought to mediate conflicts between the various legal systems recently incorporated into the Roman state. No longer restricted to ritualistic, here-and-now conveyances, contracts could stipulate future actions and could be undertaken without rigid formulae and public performances. They could still be written, but they could also be based on oral promises backed by a consideration.

The Comparative Method: History and Evolution

Maine endeavored to develop a relatively new discipline, the historical study of comparative jurisprudence. In constructing a history of Roman law, he could turn to the few documents that had been preserved, including fragments of the Twelve Tables, the praetorian edict, the Latin works of jurists like Gaius and Justinian, and writings by scholars of his own era, like Friedrich Karl von Savigny. Some speculation was necessary to fill in the gaps as Maine traced the path from status to contract. Both comparative philology and comparative legal scholarship encouraged the collection of supporting evidence. For example, Maine felt that he could demonstrate that the *patria potestas* was a Pan-Aryan institution, evident in Ancient Greece and in India in the Sanskrit *Laws of Manu*.

One manifestation of status, the collective ownership of property and the denial of individual rights, could be demonstrated in the early medieval *mark* community of the Germans, as described by Georg Ludwig von Maurer. In his second major work, *Village Communities East and West* (1871), Maine described a form of communalism in many interior portions of the Indian subcontinent. Here, Maine argued, a community composed of different families and unequal groups of specialists (*jatis*, or "castes") shared some land rights, such as the ownership of wasteland used for pasture. Arable land was partitioned between different groups, but all united in communal labor on it. This later form of "status" was based not so much on kinship as on the territory that was maintained by agricultural labor and the exchange of specialist services. Maine's somewhat oversimplified portrayal of the village community was corrected by later writers. It reflected the

situation in less than a quarter of Indian communities and, as Maine conceded, virtually none in the coastal regions, where the British presence had been strongest.

Maine's use of the comparative method to align 19th-century India with the Europe of an earlier time reminds one of the evolutionary anthropologists of his era, but his deliberate, almost exclusive, concentration on Aryan societies differentiates him from such scholars. Unlike them, Maine was not much interested in primitive societies and had little to say about "primitive" law. He thought that law in the proper sense had been preceded by the arbitrary commands of primitive rulers and then by the slow development of prelegal customs by village elders. In Rome, the development of the *patriarchal family*, *the gens*, and the state was accompanied by the birth of true law, and once there was writing, it could be preserved in codified form.

Within 20 years of the appearance of *Ancient Law*, the writings of J. F. McLennan in Scotland and Lewis Henry Morgan in the United States had advanced a "matriarchal" theory that challenged Maine's assertion that the patriarchal family was probably primal. Although they disagreed on the reasons and details, both agreed that promiscuity and sexual mayhem were the normal state of affairs in the earliest human societies. The development of mother-right (matriliny), the recognition of kinship to the mother and mother's brother rather than the father, was a natural consequence of a situation where people were ignorant of physiology and could not identify their fathers. According to Morgan, primitive promiscuity was succeeded by group marriage and then by occasional polygamy. The first societies to develop horticulture and live in villages were matrilineal. Like the Iroquois, whom he studied, they were composed of matriclans that owned property in common. Matrilineal societies were egalitarian, and Morgan noted that Iroquois women played important social roles. As surpluses developed and inequality increased, the clan became patrilineal and the society patriarchal. Although Morgan used the Roman word *gens* for the property-owning Iroquois clan, his idea of the universal priority of matriliny and speculations about matriliny irritated Maine, who noted that Darwin had strongly supported the patriarchal theory and the rejection of primitive promiscuity, because it was the nature of male quadrupeds to be jealous of potential rivals and assert their power within the group. Such ideas also made a universal stage of matriliny improbable.

Unlike unilinear evolutionists such as Lewis Henry Morgan and Edward Burnett Tylor, Maine neither embraced the idea of psychic unity nor advanced any theory of graduated stages in social evolution based on improvements in technology, morality, or ideation. Indeed, it could be argued that he was not really an evolutionist at all. His accomplishment was the construction of a contrast between two very different ideal types of sociation. The great sociologist Ferdinand Tönnies utilized Maine's contrast between *status* and *contract* in developing his ideas of *Gemeinschaft* and *Gesellschaft*, and his ideas were amplified by Max Weber. The contrast also foreshadows Émile Durkheim's *mechanical and organic solidarity*. It reflects Maine's historically grounded understanding of the relationship between law, social interests, and social change, which was closely connected to his political attitudes.

Although he was a supporter of free trade, an expression of "contract," Maine was in other respects a Tory, and was particularly conservative in his ideas about the role of law in society. In *Ancient Law*, he expressed his disdain for Rousseau's ideas of the state of nature, the natural law, and the social contract, which he argued provided a program for subsequent Jacobin bloodshed. He was also skeptical about the reformist ideas of the utilitarians. He opposed any form of legal activism that assumed that all human societies were alike and that one could implement social change through law in a directed fashion. In his view, the genius of Roman law was that it grew slowly, as magistrates such as the praetors, scholars such as the jurisconsults, and legislators (particularly in later years) reacted to social change through the deployment of legal fictions, the development of equity, and the creation, when necessary, of new law.

Colonial Contexts

Maine went to India in 1863 as legal advisor on the Viceroy's Council. At that time, the Mutiny of 1857 was causing a reevaluation of the program of legal reform that had been undertaken with the aim of making India a reflection of British post-Enlightenment, humanitarian values, and thereby justifying imperialism. However, the Mutiny

convinced many administrators that the policies of liberal imperialism had been utterly wrong. In her book *Alibis of Empire*, Kuruna Mantena argues that Maine's career in the imperial service and his influential writings perfectly accorded with the spirit of post-mutiny imperialism, which rejected the liberal program and cautioned against reformist policies that ignored cultural difference. Despite Maine's negative attitude toward the Hindu religion, he had slowly developed an appreciation of the traditional Indian village society as something socially coherent, composed of intricate networks of obligation, well adapted to rural life, and based on a system of land tenure that was not originally linked to the marketplace. That appreciation, evident throughout *Village Communities*, was an acknowledgment of both cultural similarity and cultural difference, hardly relativism but a step in that direction. Indian village life was certainly not preferable to Victorian laissez-faire, but it was superior to the life of primitives because its Aryan institutions possessed the potential for slow development.

In India, Maine was involved in the drafting of 200 bills, including a codification of the marriage law that permitted civil marriages. He believed that legal reforms were necessary to deal with the problems already created by unwise interference. Many colonial officials interpreted his work as a warning against the fast introduction of the market principle into the rural economy, because one broken cog in the wheel could send the whole cart flying. The dissolution of native society was a possible, unintended consequence of misdirected legislative and political action. On the other hand, a wise colonial official might take steps to retard or forestall change. As Clive Dewey has noted, some later legislation in India reflected Maine's caution and gradualism. According to Mantena, Maine's intellectual successors included Alfred Lyall in India, Arthur Gordon in Fiji, and Lord Lugard in Africa, all advocates of the policy of Indirect Rule, which sought to integrate indigenous leaders into the colonial administration.

Historians of anthropology have noted how well functionalist and structural-functionalist anthropology served the purposes of Indirect Rule, which is hardly surprising given that both the anthropological and the political practices reflect Maine's conservative colonialism. Given functionalism's integral ties with fieldwork, we should note that Maine's reconstruction of law in the early Roman Republic was based on hallowed but imperfect documentation and his insights into rural India relied on the reports of settlement officers. However, his ideas had a strong resonance in impeccable fieldwork studies of the legal systems of lineage-based societies in Africa, as readers of Max Gluckman on the Lozi and Paul Bohannan on the Tiv may attest.

Mair, Lucy

Lucy Phillips Mair (1901–1986) was an eminent British anthropologist, an academic, and an ethnographer specializing in Africa and colonial administration (later renamed applied anthropology).

Biography and Major Works

Mair was born on January 28, 1901, in Banstead, Surrey, the eldest of four children of David Mair and Janet Thomson. She attended St Paul's Girls' School in London, before attending Newnham College, Cambridge. On her arrival there in 1919, she found

women under intense pressure to prove themselves equal to men academically. Mair never married; one of the chapters in *Marriage* published in 1971 titled "What Are Husbands For?" indicated that she held strong views on women and men's roles and status in the world around her. Her strong intellect and views about the position of women and about colonial administration, a subject about which some anthropologists were critical and dismissive, found her being described on occasion by fellow anthropologists as "fierce" and socially awkward. Others might suggest that she was ahead of her time in promoting authoritative views as a woman in a man's world.

After graduation from Cambridge University in 1922 with a BA in classics, she was employed by the liberal activist, politician, and public intellectual Gilbert Murray as his secretary-assistant in the League of Nations for 5 years. In 1927, she joined her mother and future stepfather at the London School of Economics (LSE), holding a lectureship in international relations. There, Audrey Richards introduced Mair to Bronisław Malinowski's seminar series in anthropology, because her work (on mandated territories) involved Africa and Richards thought that no one could understand Africa unless they understood anthropology. Mair was said to have been impressed by Malinowski's charm, but she remained a skeptical admirer, with deep reservations about his ideas. He nevertheless arranged for her to go to Buganda (in what is today south-central Uganda) to do fieldwork, funded by a grant from the Rockefeller Foundation. Mair spent 9 months in Africa doing ethnography that resulted in her first anthropological work, *An African People in the Twentieth Century* (1934). She returned to the LSE in the early 1930s and gained her PhD. She was a member of the group that included Edward Evan Evans-Pritchard, Raymond Firth, Meyer Fortes, Max Gluckman, Audrey Richards, and Isaac Schapera, as well as Siegfried Frederick Nadel and Edmund Leach. It was a stimulating though not always harmonious group. Some of its members later came to dominate British social anthropology and were to have a deep influence on anthropology in the United States.

Mair continued to teach at LSE, taking responsibility for the courses that trained colonial administrators. Her students, initially mostly former members of the British army, later included talented young local nationals from the colonies themselves. After World War II, funding for this training was lost, and students were guided to residential universities, where they were thought less likely to be exposed to radical ideas. Later, in the 1960s and 1970s, Mair was confronted by socialist and Marxist anthropologists who disparaged colleagues who had worked in the maintenance of the colonies. She denied that everything the colonial administrators had done was completely wrong and insisted that her work offered improvement and choices in governance for the local population. She promoted the view that academics like herself were best suited to deliver training for colonial officers and was adamant that careful scholarship and hard work promoted fairness and social justice. Her strong position on such matters reflected her earlier experiences and a rather dogmatic stance on colonial matters.

During the Second World War, Mair served in the Royal Institute for International Affairs and at the Foreign Office. On her return to the LSE, she was seconded to Canberra to teach members of the Australian military administration of Papua New Guinea. She had two postings there and wrote *Australia in New Guinea* (1948), with an updated version a few years later. In 1947, she was promoted to a reader in colonial administration, and in 1952 she began a second readership in applied anthropology. She influenced a wide range of students, from the young men in the colonial administrators' course to her BA and PhD students in social anthropology from the 1950s. Mair became professor in 1963, and she taught at the universities of Durham and Kent after her retirement in 1968. In 1964, she was made president of Section 4 of the British Association for the Advancement of Science.

Critical Contributions to Anthropology

Mair wrote extensively on the subject of social organization and contributed to the involvement of anthropological research in governance and politics. Her view was that development could not be considered a discipline separate from economic and social anthropology. She thought that it was essential to know the social organization of developing peoples so as to be able to assess the likely consequences of intervention.

Mair's early publications (many collected in *Studies in Applied Anthropology*, published in 1957, and *Anthropology and Social Change*, which appeared in 1969) were concerned with the technical problems of colonial administration and with

explaining the aims and achievements of anthropologists to an audience of administrators. *New Nations* (1963), *The New Africa* (1967), and *Anthropology and Development* (1984) summarized and consolidated that work, making it accessible to students and administrators. In the postwar years, she began a series of short volumes based on her lectures: *Primitive Government* (1962), *Witchcraft* (1969), and *Marriage* (1971). In 1972, she published her *Introduction to Social Anthropology*, which was still in print 25 years later. She was critical of colleagues who would only write specialist work for an audience of their own kind, and these last four books, concise and expository accounts of the state of knowledge, brought her a much wider readership.

On her death in 1986, Mair bequeathed her book collection to libraries at the LSE; her own books continue to be read and still contribute to the body of anthropological literature. Throughout her working life, Mair was closely involved with the Royal Anthropological Institute. After winning the institute's Wellcome medal in 1936, she served as honorable secretary from 1974 to 1978 and as vice president for the year 1978–1979. After her death, the Royal Anthropological Institute instituted the Lucy Mair Medal for Applied Anthropology in 1997 to commemorate her life and work.

Malinowski, Bronisław

A founding father of British social anthropology, Bronisław Kasper Malinowski (1884–1942) pioneered modern fieldwork methods, re-created the genre of ethnographic writing, promoted applied anthropology in Africa, and contributed to many academic debates and popular causes. At the time of his death in the United States, he was a scientific celebrity, an international humanist committed to the battle against totalitarianism.

Biography and Major Works

An only child, Malinowski was born in Cracow, the capital of Galicia in the Austro-Hungarian Empire. Both his parents were impoverished gentry of Roman Catholic persuasion, a faith that Malinowski abandoned as a youth. His father was a distinguished professor of Slavic philology at Cracow's ancient Jagiellonian University. Malinowski's formal schooling was interrupted by recurrent illnesses, and his mother devoted herself to his education and took him on health-seeking trips to the Mediterranean countries. By the time he was 16, Malinowski spoke several languages and had developed a cosmopolitan outlook. Like his compatriot and literary hero, Joseph Conrad, he would attribute his enthusiasm for the exotic to these early experiences of cultural variation.

Malinowski studied philosophy, physics, and mathematics at the Jagiellonian University, receiving his doctorate with the highest honors in 1908. A significant influence in his youth was his passionate, competitive friendship with Stanisław I. Witkiewicz, alias Witkacy, a celebrated avant-garde artist and dramatist. Outshone by his friend's artistic genius, Malinowski directed his own creative ambitions toward science. His brilliant doctoral dissertation on the positivism of Ernst Mach, "On the Principle of the Economy of Thought," contained the seed of Malinowski's later functionalism, the anthropological doctrine for which he became renowned. Following in his father's footsteps, Malinowski spent a year at Leipzig University, where he renounced physical chemistry for the anthropological psychology (*Völkerpsychologie*) of Wilhelm Wundt and the economic history of Karl Bücher. Initially sparked by a youthful reading of James Frazer's *The Golden*

Bough, Malinowski's interests turned inexorably toward anthropology.

In March 1910, Malinowski traveled to London to continue his studies in ethnology and "primitive sociology" at the London School of Economics, under the supervision of C. G. Seligman and Edward Westermarck. As well as Sir James Frazer, Malinowski befriended A. C. Haddon and W. H. R. Rivers, both of whom, like Seligman, were veterans of the pioneering Cambridge University Torres Straits Expedition of 1898–1899. Each of these men played some part in advancing Malinowski's early career.

In 1913, Malinowski published a work begun in Leipzig, *The Family Among the Australian Aborigines*, which his later rival A. R. Radcliffe-Brown praised as a model of scientific method. Based on a critical evaluation of the ethnographic literature, it addressed current controversies about the origin of marriage and the family and overturned the evolutionists' assumption that the Aborigines practiced "group marriage" and that therefore the individual family could not exist.

The outbreak of war in August 1914 caught Malinowski in Australia on his way to begin fieldwork in Papua (ex-British New Guinea). His 3-month apprentice fieldwork among the coastal communities of southern Papua was of the survey type, as conducted by Haddon and Seligman. Assisted by local missionaries and working through a trade language, he came to realize the deficiencies of this kind of investigation. Returning to Australia for a few months, he dashed off *The Natives of Mailu* (1915), a conventionally structured report guided by the categories of *Notes and Queries in Anthropology*. Although the monograph won him additional funding from the Australian government and helped him earn a DSc degree from the University of London, he belittled it as a mere "pamphlet."

Malinowski returned to Papua in June 1915, and while waiting for a boat to the north coast, he made a fateful detour to the Trobriand Islands in the northern Massim, an insular region that Seligman had surveyed a decade earlier. Although wary of treading on his supervisor's ethnographic toes, Malinowski was intellectually captivated by its vibrant culture. Seligman approved his change of location, affording Malinowski the opportunity to put into practice the rules laid down by Rivers (his "patron saint of fieldwork") for intensive study. He avoided consorting with the resident Europeans by pitching his tent in the chief's village and quickly learned that close observation of everyday activities yielded unexpected insights into peoples' lives. Once he had invested time and effort in learning the language of Kiriwina, its ethnographic gifts were his for the asking. He made the recording of "concrete occurrences" and "actual cases," another cornerstone of his ethnographic method. He amassed documentation—genealogies, sketch maps, plans, photographs, measurements, and vernacular texts on every conceivable subject. Although he was inclined to observe rather than to participate in everyday activities, "participant observation" became the slogan for later generations of field-working anthropologists. He devised "synoptic charts" for summarizing information; they revealed gaps in his data and enabled him to visualize the functional interconnections between institutions. He later used the synoptic charts as teaching aids in the classroom to demonstrate his functional method.

Malinowski interrupted 20 months of intensive fieldwork in the Trobriands with a lengthy break in Melbourne. Although he suffered recurrent bouts of illness, it was a productive period. He began his courtship of Elsie Rosaline Masson, daughter of an eminent Scottish professor of chemistry, whom he later married and with whom he had three daughters. He wrote *Baloma: The Spirits of the Dead in the Trobriand Islands* (1916), a methodologically sophisticated treatise on the sociology of Trobriand religion, which dealt with the ideological underpinnings of matrilineal kinship and the denial of physiological paternity. He sorted his field notes with a view to compiling a comprehensive ethnographic compendium—a mammoth project that he later abandoned in favor of a series of focused monographs. On his second expedition to the Trobriands in 1917–1918, Malinowski concentrated on checking, validating, and enlarging the data he had collected on the previous trip, transcribing oral texts and extending his command of the vernacular.

Under light government surveillance as an enemy alien, he had spent a relatively peaceful war in the islands, though haunted by reports of the terrible events in Europe and devastated by the belated news of his mother's death in Poland. Fieldwork by immersion in an alien culture had exacted a heavy psychological price, and Malinowski's posthumously published field diaries speak poignantly of his lonely ordeal. While *A Diary in the Strict Sense*

of the Term (1967) scandalized many readers by its author's racist expressions and explicit sexual fantasies, it is a ruthlessly honest document, profoundly introspective yet therapeutic, in which Malinowski kept a daily ledger of his achievements, failings, and moral dilemmas. He came to the important realization that his diary and his ethnography were complementary; the former sharpened his insight into the experiences of his native subjects, bringing him closer to the final goal of the ethnographer: "to grasp the native's point of view . . . to realize *his* vision of *his* world."

As the war was about to end, Malinowski returned to Australia "as laden with materials as a camel." In early 1920, he sailed back to Europe with his bride Elsie and his ethnographic treasures. Following brief sojourns in Scotland and Poland (where Malinowski turned down the offer of a professorship at the Jagiellonian University), the couple spent several months in Tenerife, where Malinowski completed his classic monograph *Argonauts of the Western Pacific* (1922), a richly detailed account of the canoe-borne trade and ceremonial exchange of arm shells and shell necklaces, which linked the Trobriands via the *kula* circuit to other island groups of the Massim. A preface by Sir James Frazer ensured the successful launch of *Argonauts*, and although it fell far short of the best-selling status of *The Golden Bough*, it has never been out of print.

Appointed a lecturer in 1922, a reader in 1924, and foundation professor of social anthropology in 1927, Malinowski's rise to eminence in the University of London was rapid, and he was granted British citizenship in 1931. He worked extraordinarily hard, teaching, writing, and propagating his views on many contemporary social issues: marriage and the family, divorce, sexual morality, birth control, religion, race, and warfare. He won popular recognition as a polemical essayist and broadcaster. His Socratic seminars at the London School of Economics attracted students from every continent and from different academic disciplines, who catalyzed a heady ferment of ideas. He used what his pupil and colleague Raymond Firth called "intellectual shock tactics" to get his students to think for themselves. His enthusiasm for his subject was that of a prophet, the self-proclaimed "godfather and standard-bearer of the School of Functionalism," who invented a novel methodology for a new scientific discipline.

In collaboration with the International African Institute, Malinowski won Rockefeller Foundation support for his vision of a "practical anthropology" and advocacy of "an anthropology of the changing native." Insofar as it addressed colonial policies in Africa, his work in this field amounted to a second anthropological revolution. As well as for the British Colonial Office, he exercised influence as an informal advisor to bodies such as the International Missionary Council, the British Social Hygiene Council, and Mass Observation (which adopted his latest slogan, "Anthropology begins at home"). With Rockefeller funding under International African Institute auspices, he trained a talented cohort of research fellows, including Audrey Richards, Lucy Mair, Hilda Kuper, Meyer Fortes, and Siegfried Nadel. In 1934, he visited students working among the Bemba and the Swazi and conducted some cursory fieldwork of his own among the Arusha and the Chagga.

During his prolific years in London, Malinowski promoted his theories in innumerable essays, book reviews, encyclopedia articles, and lengthy forewords to his students' books. In his Trobriand monographs, he strived for scientific candor with the principled separation of fact and opinion. He was scrupulous in telling the reader what events he had or had not witnessed, appealing to his "seeing eye" as the hallmark of his authority. Malinowski's best ethnographic writing is a rhetorical confection of colorful description, reflexive anecdote, native commentary, and theoretical aside. While he aspired to be the Joseph Conrad of anthropology, he settled for being its Émile Zola.

Following *Argonauts*, he published *Crime and Custom in Savage Society* (1926), a pathbreaking little book that described the workings of quasi-legal mechanisms in the Trobriands. His analytical insights into "the binding force of reciprocity" in everyday exchanges and his pioneering use of the case method laid the foundations of legal anthropology. *Sex and Repression in Savage Society* (1927) was a polemical work that contested Freudian dogma concerning the universality of the Oedipus complex. Malinowski argued that the emotional configuration of the Trobriand family under the rules of matriliny ensured that it was the mother's brother, not the father, who was the resented authority figure, and it was the sister, not the mother, who was the object of a boy's incestuous desire. *The Sexual Life*

of Savages (1929) was a comprehensive ethnography of Trobriand courtship, marriage, and domestic life; while avoiding pornography, it amounted to a subversive assault on sexual prudery and hypocrisy, and in the changing mores of the period, it had a liberating appeal. *Coral Gardens and Their Magic* (1935) dealt exhaustively with horticultural practices and their ritual accompaniments, with the politics and mythological basis of land tenure, and with the poetic language of magic. It was in 1935, after a protracted and debilitating illness, that Elsie died, just before the appearance of *Coral Gardens*—a work her husband had dedicated to her.

Malinowski had made his first enthusiastic trip to the United States in 1926 on a Rockefeller-sponsored fellowship, and although some members of the Boasian school of American anthropology were antipathetic to the man and his message, he was invited twice more to give lecture tours and notably, in 1936, to receive an honorary doctorate from Harvard University. In 1938, he returned to the United States for a health-seeking sabbatical in Tucson. He visited Indian reservations and taught a seminar at the University of Arizona, followed by a summer school at Smith College, in Northampton, Massachusetts.

With the outbreak of World War II, he was advised by the London School of Economics authorities to remain in the United States, and at the end of 1939, his three daughters left England to join him. To supplement his reduced income, he taught evening classes at the New School for Social Research in New York and accepted a visiting professorship at Yale University. In 1940, he married his long-term partner, the English painter Valetta Swann. They spent the summers of 1940 and 1941 in Mexico, where Malinowski, assisted by a young Mexican anthropologist, Julio de la Fuente, conducted fieldwork on the Zapotec market system of the Oaxaca Valley. Although a Spanish translation of their pioneering report had a significant influence on later studies of market systems, *The Economics of a Mexican Market System* (1982) was not published in Malinowski's lifetime.

Following Hitler's invasion of Poland in September 1939, Malinowski joined the "Great Debate" with a lecturing and writing campaign to convince Americans of the need to fight the German war machine. The war revived his dormant Polish patriotism, and he wrote passionately against the evils of totalitarianism and the menace of rampant nationalism in a series of essays on the anthropology of war, culminating in his posthumously published *Freedom and Civilization* (1944). He assisted many Jewish friends and colleagues to escape Nazi persecution, though he was less successful in finding them jobs. Indeed, his own position at Yale remained provisional until he was appointed finally to a permanent professorship a month before his death of a heart attack. The evening before he died, on May16, 1942, he addressed the inaugural meeting of the Polish Institute of Arts and Sciences in America, of which he had been elected president.

Critical Contributions to Anthropology

Malinowski's move to England in 1913 had been at an opportune moment in the history of British anthropology. His mentors had only recently begun to professionalize the discipline and call for more intensive fieldwork. The "survey" or "rescue" ethnology conducted by researchers like Haddon and Seligman yielded weighty monographs of broad scope but little analytical depth. *Argonauts of the Western Pacific* set a completely new precedent. Malinowski's explicit intention was to raise ethnographic fieldwork to a professional art, and his self-mythicizing introduction to *Argonauts*—arguably the most influential 25 pages in the history of the discipline—prescribed a mode of research that would become a rite of passage for subsequent generations of anthropologists.

A foundation text of economic anthropology, *Argonauts* can also be read as a theoretical critique of current views of Primitive Economic Man, "a fanciful, dummy creature" motivated by enlightened self-interest. Malinowski introduced a moral dimension; he wanted his account of the *kula* (which he regarded as the highest expression of the Trobrianders' conception of value) to dismember this straw figure and dispel the rationalistic conceptions of primitive mankind. Although *Argonauts* was conceived before he had properly developed functionalism, Malinowski's methodological strategy in the book was to link magic with mythology and both with economic activity in a demonstration of their functional interdependence. Together with A. R. Radcliffe-Brown's *The Andaman Islanders*, also published in 1922, *Argonauts* signaled the beginning of a decisive paradigm shift in British

anthropology—from evolutionary and diffusionist speculations concerning mankind's past to a social anthropology of the present based on empirically observed and theoretically driven ethnographic accounts of particular societies.

The revolution in anthropology Malinowski sought to promote demanded a broad assault on the "antiquarians" of the *ancien regime*. His theoretical strategy was to generalize from the Trobrianders in their Melanesian cultural garb to the rest of humankind. Every ethnographic domain—magic and religion, mythology, language, law, sex, kinship, marriage, the family—was vulnerable to Malinowski's tactic of bringing to bear firsthand data of a depth and complexity none of his opponents could match. Thus did the fruits of intensive fieldwork transform anthropology from the antiquarian study of items of custom into the sociological study of institutions.

Malinowski elaborated a theory of functionalism from 1926 onward, his stated purpose being to discover the laws and regularities that governed social behavior. There were two strands to his functionalism: (1) methodological (inspired by fieldwork practice) and (2) doctrinal (based on the premise that there are cultural universals). Empirical observation, he believed, was the principal scientific activity of anthropology. Through direct field observations, the researcher examines the actual working of a custom or an institution to determine the purpose it serves; this should provide the key to its meaning and the reason for its existence. He taught that there were no facts without theory and that it was functional theory that provided the criteria of relevance for the observation, selection, and recording of data; it also directed the field-worker to new observations, which in turn posed fresh questions. As a matter of fieldwork principle, functionalism required all data to be fully contextualized, that is, treated holistically. Functionalism was thereby a safeguard against the detachment of any custom from its living context.

The doctrinal strand of Malinowski's functionalism was formalized in his posthumously published *A Scientific Theory of Culture* (1944). Anthropology ("the proper study of mankind") was the science of culture, which sought to develop common measures for the comparative study of cultures. While recognizing that human cultural diversity is the *raison d'être* of anthropology, his scientific interest lay in the search for what he called the "underlying sameness" of cultures. A culture is a complex instrumental apparatus for the satisfaction of human needs, individual and social. In the satisfaction of man's primary needs (e.g., for food, sex, and shelter), it produces secondary or derived cultural needs, which in turn produce third-order integrative needs. Critics have not been kind to this instrumental, formalistic "system" in which Malinowski invested so much thought. His attempts to elaborate it in light of the behaviorism of his Yale colleagues resulted in even greater complexity; it grew unwieldy and vacuous. If his functionalism survives as a method, its status as grand theory is largely discredited.

Malinowski's Legacy

Malinowski's most enduring achievement is his Trobriand corpus, among the most comprehensive and widely read in global ethnography. It continues to stimulate, provoke, and invite reanalysis. His tenets of fieldwork method have become axiomatic, and insofar as anthropologists continue to live among the people they study, they will continue to be guided by his ideas concerning the functional interconnection of the sociocultural phenomena they observe.

Another achievement was his creation of a cohesive school of social anthropology that proliferated for a generation. Established in key academic posts, his students gave the discipline a distinctive intellectual profile. Following Malinowski's departure for the United States, his influence in Britain was temporarily eclipsed by that of Radcliffe-Brown, whose Durkheimian structural functionalism attracted many of Malinowski's erstwhile disciples. *Man and Culture* (1957), a volume in Malinowski's memory edited by his pupil and successor, Raymond Firth, revived the master's reputation. While agreeing that he was an incomparable ethnographer, the majority verdict of the dozen contributors was that he had been a flawed and inconsistent thinker whose psychological functionalism had prevented him from grasping the analytical priority of social systems and structures. But even his most critical pupils acknowledged the theoretical contributions he had made to fields as disparate as kinship, psychoanalysis, mythology, law, economic anthropology, and applied anthropology. His contribution to anthropological linguistics, semantics, and the ethnography of speaking through concepts such as "phatic communion" and "context of situation" also remains seminal.

The publication of his private diaries brought him renewed posthumous fame. They fueled the epistemological and moral crisis of anthropology in the 1970s, when decolonization was focusing attention on the exploitative aspects of the discipline in its alleged role as a "handmaid of Imperialism." In 1984, Malinowski's centenary yielded another round of evaluations, most importantly by the Polish scholars who rehabilitated Malinowski in his homeland following his disparagement under communism as a reactionary bourgeois anthropologist. In America, meanwhile, postmodernists used Malinowski's diaries for their own rhetorical ends in deconstructing ethnographic authority and denouncing positivism. Ironically, by deploring anthropologists' romantic infatuation with "the freakish," he had preempted by half a century the postmodern critique of exoticism. In this new century, Malinowski remains a venerable ancestor and an anthropologist for all seasons.

Malthus, Thomas R.

Thomas Robert Malthus (1755–1834) was educated at Cambridge University. He took holy orders on his graduation in 1788, though he pursued an academic rather than a religious career, becoming professor of political economy at the East India College in Hertfordshire in 1805. He is best known for his *Essay on the Principle of Population*, written in 1798. His concerns with population growth in relation to agricultural production inspired demographic research in anthropology as well as in many other disciplines. However, his conclusions were fiercely contested by 19th-century theorists of progress, ranging from Herbert Spencer to Marx and Engels.

Malthus's *Essay* was an attack on the utopian and politically radical ideas of Condorcet and William Godwin, for whom the ultimate aim of progress was the reduction, if not the elimination, of human suffering. Malthus attempted to reconcile a progressive conception of human development with a uniformitarian vision of human suffering. His principle of population, that any increase in food production would be matched if not surpassed by an increase in population, was meant to demonstrate the inevitability of "misery." A corollary of this iron law of population was that any measures of social welfare taken by the state to alleviate the misery of the poor would actually make matters worse; without a concomitant increase in food production, any monies distributed to the indigent would simply result in inflation in the cost of food, penalizing the rest of the "labouring classes." Malthus argued that social inequality, the class division of society into rich and poor, was equally founded in the laws of nature and that life, of necessity, was a process with winners and losers.

Suffering, for Malthus, was simultaneously an impetus to virtue and a punishment for evil. Misery, in the form of starvation, was the price humanity had to pay for succumbing to unbridled sexual desire. Alongside misery as a check to population, he added "vice," namely, "vicious customs with respect to women, great cities, unwholesome manufactures, luxury, pestilence, and war" (1976, p. 44). Malthus's ideal society was decidedly rural, with the bulk of its working population directly devoted to the production of food. Malthus's *Essay* is, among

other things, an impassioned if ineffective conservative critique of the emerging industrial order in England. For Malthus, the manufacture of frivolous luxuries in large towns was simultaneously a moral evil, another form of social capitulation to the forms of desire, and a recipe for misery on a grand scale. For Malthus, there remained only one unambiguously positive check on population: the practice of delayed marriage. Malthus astutely and correctly noted the importance of this specifically European marriage pattern. If suffering were the punishment for succumbing to unrestrained desire, through the operation of the natural consequences of a divinely created order, then restraint, in the form of delayed marriage, was the path to demographic salvation.

If the original version of Malthus's *Essay* directly addressed issues that we, with hindsight, might label "anthropological"—notably the vision of humanity's development through progressive stages—he hardly devoted a great deal of attention to non-European populations. However, in the revised version of the *Essay* published in 1803, Malthus very considerably expanded his discussion of non-Europeans. Indeed, the whole of Book I (of III) was devoted to the factors that checked population growth in less civilized parts of the world and in the past.

Malthus was concerned to demonstrate the ubiquity of "misery" and "vice" and to dispel any residual nostalgia about "noble savages." The South Sea Islands, Tahiti in particular, had been depicted in some of the travel literature in idyllic terms, especially by Bougainville. Malthus, drawing on the subsequent and considerably less enthusiastic observations of Cook and Vancouver, was at pains to dispel any such impressions. China constituted for Malthus an anomaly of a rather different sort, given the sheer size and density of its population. In at least one respect, Malthus expressed genuine admiration for China, precisely because such a huge proportion of the population was involved in agriculture as opposed to manufacturing. Such an agrarian society corresponded to Malthus's ideal. On the other hand, the practice of marrying young in China, as opposed to European patterns of delayed marriage, contributed substantially to the "wretchedness" of the population at large. China was simultaneously touted by Malthus as a model of the benefits of a national policy that consistently privileged agriculture over industry and as a dire warning of the depths of generalized misery in which overpopulation, taken to its extreme, results.

Malthus's ideas were an important influence on Charles Darwin, who considered that the "struggle for existence" caused by the tendency of species to increase faster than the available food supply was the prime motor of natural selection. On the other hand, Malthus's pessimistic conclusions were contested by other 19th-century evolutionary (not to mention revolutionary) thinkers. In 1852, Herbert Spencer published a rebuttal, suggesting implausibly that, in Lamarckian fashion, the growth of the human brain was accompanied by a decrease in sexual appetite. More convincingly, he argued that population pressure is an essential spur to innovation, leading to increased productivity of food production, and as such a critical factor in human evolution. More recently, Ester Boserup has formulated a similar argument.

In spite of such critiques, Malthus has remained a fundamental (if often unacknowledged) influence in anthropological demography and in cultural ecology. Roy Rappaport's *Pigs for the Ancestors* (first published in 1968) is a notable example of an influential ethnography that considers the relationship between population pressure, pig husbandry, ritual, and warfare in New Guinea, a testimony to the enduring influence of Malthus's thought.

Manchester School

The Manchester school, a landmark in the history of British anthropology, represents the life and work of a group of distinguished ethnographers and their students at Manchester University's Department of Social Anthropology. It was founded in 1947 by Max Gluckman, who chaired it for the next 2 decades.

Beginnings

The school's innovative methodology and theory were rooted in an earlier phase in Gluckman's career as director of the Rhodes-Livingston Institute in south-central Africa. His close colleagues and students adopted some of his major formative ideas about ethnographic fieldwork and anthropological theory. Contesting earlier "functionalist-structuralist" anthropologists' perceptions of social life in their studies of tribal societies, he considered conflict an indispensable feature of social life in all small groups and larger human societies. He also revealed the weakness of ethnographic presentations based on "apt illustrations," namely, reliance on sporadic examples of social behavior portraying static structural societal features and postulating an authoritative code of normative behavior. Instead, he proposed what became known as the "extended-case method" or "situational analysis," which reported the follow-up over time of series of events that signified a dynamic process of ongoing relations between individuals and groups in a social system and a culture. That conceptual paradigm also demonstrated the fluctuations in real-life situations that modify the apparently commanding power of norms of social behavior and cultural prescriptions.

The extended-case research strategy demanded rich, detailed reporting of participants' behavior in the cases presented in the Manchester school's ethnographic writing. The school's practice of closely observing the minute behavior of individuals in daily intercourse and in ceremonial events appears akin to Erving Goffman's "symbolic interaction" conception as a strategy of research and interpretation. A number of ethnographies apparently became the hallmark of the Manchester school, such as Gluckman's own pioneering report of 1940, *Analysis of a Social Situation in Modern Zululand* (describing the inauguration ceremony of a bridge in South Africa and interpreting the mode of participation of the different constituencies of Whites and Blacks in a divided society), Clyde Mitchell's 1956 ethnographic presentation of *The Kalela Dance* (introducing the dynamics of interaction between various tribal groups drawn together in a new urban African setting), and Victor Turner's 1957 *Schism and Continuity in an African Society: A Study of Ndembu Village Life* (describing the contest of asymmetrical obligations of father/son/mother's brother/uncle in a matrilineal society). In all the above studies, the major sociological inquiry probed the strategies of containing conflict in situations of competing interests and ambiguous circumstances of moral accountability; in Gluckman's teaching, this conflict arises between community ideals and individual interest, often self-interest, in all human societies. An important hypothesis for the circumstances of reconciliation of belligerent groups was his idea of "cross-cutting ties." The theoretical leitmotiv in the above and other Manchester school works was the assumption that the micro situations are at once the representative and the outcome of the macro-socioeconomic-cultural social system. This approach, almost inevitably, was problem oriented at the outset of research and at the conclusion of ethnographic writings by the school's adherents—as against the more descriptive mode of the classic functionalist-structuralist ethnographic presentations.

The Extended-Case Method: An Example

An illuminating example among the later Manchester school works is Abner Cohen's 1965 ethnography *Arab Border Villages in Israel*, which is about the reemergence of competing and antagonistic *hamula* groups (patrilineal associations) in Arab villages after the defeat in the 1948 war, which left the Palestinian villagers who stayed on in the state of Israel an ethnic minority separated from the surrounding Arab world. Employing the extended-case method, Cohen described in detail some dramatic events that proved his conclusion about the new roles ascribed to these apparently defunct traditional kinship groups. The old norms of kinship obligations (e.g., insistence on in-*hamula* marriage) were now revived, offering a sense of security as well as economic and political support to villagers confronting the changing circumstances since the forced

separation from their relatives in other villages as well as the confiscation or loss of their land across the border (the "Green Line" separating Israel from the West Bank, which until 1967 was affiliated with the Kingdom of Jordan). Thus, for example, individuals (men and women) came under severe pressure exerted by their kinsmen to give up their choice of mates from other *hamula* groups.

Gluckman, who customarily wrote extensive forewords to most Manchester school ethnographies, offered a concise summary highlighting some of the major theoretical interests and the methodology advocated by the school as revealed in Cohen's book. A few final sentences in his foreword clearly present that agenda, as he concludes that the book is a study of social processes in which men and women react in terms of traditional allegiances, customs, and values to cataclysmic changes, which also animate in them new objectives. Change in process and purpose is displayed through continuity of social formations and culture, illuminated throughout by detailed analysis of actual events and the doings of particular men, who come to stand vividly before us. This is possible because the research that focuses on one village is made into a study of all Arab villages in the border region. Beyond that, it emerges as a study of general social problems, both in small communities and in general politics.

Evidently, Gluckman considered Cohen's work an outstanding ethnographic study, based on the extended-case method, reporting and theorizing on social processes (at one research site) as the consequences of the macro situation (economic and political factors in particular) affecting a wider population sharing the same environmental and social circumstances. It is indeed a showcase for the Manchester school's scientific paradigm exhibiting the interrelation between the individual and society, and between a micro situation and the macro forces impinging on the destiny of private lives, groups, and nations.

Training in the Manchester Research Tradition

The team of close colleagues and later recruits developed the strategies and rituals for training novices in the Manchester research tradition. Of particular renown was the series of weekly staff seminars, when the graduate students back from the field presented the first draft of major chapters in their planned dissertations. All teachers and students attended these sessions and were expected to comment on the reported field data and their sociological interpretation. These performances were anxiously experienced as rites of passage, when the novices had to defend their work, accept the obligatory sharp criticism about missing evidence, and follow constructive suggestions for new directions in developing their work. Most ethnographies that won their supervisors' approval for being in accord with the school's agenda and merit were recommended for publication by Manchester University Press. They all reflected the school's major characteristics in applying the extended-case method and its typical theoretical interests: the expression and containment of social conflicts (between individuals, groups, institutions, and discordant moral obligations). All were problem directed at an early stage of the research or later, when the connecting threads between the events they observed over time became revealed through the extended-case method.

In addition to being a model of professional training, the Manchester school was also unique in the social ambience of close relationships that for many years characterized daily life and intellectual interactions among its members, teachers, and students. In particular, the tradition of going regularly together to Manchester United soccer matches became famous. Gluckman would pick students up in his van on their way to the game, and afterward they would socialize at the local pub. That atmosphere of communality generated a feeling among school veterans and newcomers of sharing a distinctive theoretical perspective and advanced research tools for a better understanding of social life and culture in other societies near and far.

Although the Manchester school founding generation and their students in later years did most of their work in Africa (e.g., A. L. Epstein, Bruce Kapfferer, Norman Long, Jaap Van Velsen, and William Watson), many fieldwork projects were conducted by Manchester researchers elsewhere, too. Examples are Britain, Ronald Frankenberg; Cyrenaica, Emrys Peters; Norway, J. A. Barnes; and India, F. G. Bailey and Joyce Pettigrew. Dedicated to expanding the Manchester school legacy, in 1963, Gluckman launched his third grand research project, this time in Israel. Ten major studies had been accomplished by the time of his premature death in 1975. The blueprint of the project seemed to repeat

the agenda of the Rhodes-Livingstone Institute of the 1940s—in particular identifying the interaction between different ethnic groups and the maintenance of social order in spite of the centrifugal forces that separate them. In practice, all participants studied small social settings, villages, and towns mostly on the periphery of post-1948 Israeli society (e.g., Myron Aronoff, Shlomo Deshen, Don Handelman, Emanuel Marx, and Moshe Shokeid). All their ethnographic texts could be identified by the Manchester "trademark"—the extended-case method. Likewise, they all engaged in issues of conflict: between Jewish immigrants and the absorbing institutions, among political parties, among kinship groups, between individuals' material and spiritual expectations and the realities of daily life, and between old timers and newcomers in Israeli society. For example, the first ethnography, published in 1970 by Shlomo Deshen—*Immigrant Voters in Israel: Parties and Congregations in a Local Election Campaign*—reported his ongoing experiences as he attended activities in a new immigrant town in southern Israel during a national election campaign. He described in detail the fierce competition between various political parties, whose audacious delegates manipulated religious symbols to attract voters unaccustomed to a democratic state system.

However, Gluckman's ambition to conceptualize and represent a "holistic" portrayal of Israeli society was hardly accomplished through that sample of fieldwork projects. Characterizing the conflicts and other social problems reported in these studies as the outcome of the macro situation was undoubtedly conclusive, but they alone could not represent the "macro," that is, Israeli society. This project, although successful in the production of excellent ethnographies, nevertheless revealed the shortcomings of the Manchester school research scheme when applied to a complex industrialized society, in contrast to its role and achievements in presenting the major structural cleavages and cultural contradictions in colonial and postcolonial African societies.

Legacy

The Manchester school's heyday passed with Gluckman's retirement from the chairmanship of the department. But its decline in international anthropological discourse was no less due to the rise of new theoretical paradigms, in American anthropology in particular. Gluckman's neo-functionalism seemed outdated, and the work of many anthropologists of his generation and his close colleagues conducted in Africa and in other Third World societies came under criticism with the rise of the Marxist and other critiques of colonialism in the 1970s and the 1980s. The new genres of postmodernism and reflexivity left the Manchester school ethnographies behind, burdened by wearisome detailed descriptions and lacking the notion of the anthropologist's personal engagement. However, the younger students who moved on to other research fields, and accommodated the new theoretical winds in anthropology, carried with them to new academic centers their school's legacy of fieldwork. Actually, the Manchester school's methodology has been adopted—without its name—by many ethnographers in Europe and America. Particularly influential is the leading position attained by Victor Turner in American anthropology. His highly regarded writings (e.g., *The Forest of Symbols* and *The Ritual Process*) demonstrate a decisive achievement for the Manchester school in the arena of contemporary anthropology.

Marcus, George

George E. Marcus (1946–), the American anthropologist and cultural theorist, is among the most important figures of contemporary American anthropology.

Biography and Major Works

Marcus was born in Pittsburgh, Pennsylvania. He is married to the historian Patricia Seed and has two children, Rachel and Avery. He was educated at Yale University; Queens College, Cambridge; and Harvard University. He has worked as Chancellor's Professor in the Department of Anthropology at the University of California, Irvine, since 2005—where he helped found the Center for Ethnography (www.ethnography.uci.edu)—and previously served as Joseph D. Jamail Professor (2001–2006) and chair (1980–2005) in the Department of Anthropology at Rice University, where he taught from 1975 to 2006. While at Rice, Marcus was a key participant in the Rice Circle (1983–1987)—a collaborative discussion group that included anthropologists and humanities faculty from the university and whose energies led to the formation of the Center for Cultural Studies. As a professor, Marcus has been especially concerned with the critical reimagination of fieldwork projects among graduate students. He has been a participant in prestigious professional seminars at the Institute for Advanced Study, Princeton University (1982–1983); Getty Center for the History of Art and the Humanities (1988–1989); Center for Advanced Study in the Behavioral Sciences, Stanford University (2004–2005); and others. In 1984, Marcus was a participant in a seminar at the School of American Research in Santa Fe, New Mexico, which later resulted in the publication of *Writing Culture* (1986)—a groundbreaking examination of ethnography. Marcus conducted ethnographic fieldwork among the Tongan islanders of Polynesia in the 1970s. His work considered the kingly order and nobility and later addressed the issue of Tongan identity given the contexts of globalization and diasporic communities. Later, he completed fieldwork among American dynastic families and cultural elites, and in works that include *Elites: Ethnographic Issues* (1983) and, with Peter Dobkin Hall, *Lives in Trust: The Fortunes of Dynastic Families in Late Twentieth Century America* (1992), he brought important attention to the understudied area of the anthropology of elites. Marcus has collaborated widely with artists, filmmakers, politicians, architects, philosophers, and economists.

Marcus served as the founding editor of *Cultural Anthropology, Journal of the Society for Cultural Anthropology.* His text *Writing Culture: The Poetics and Politics of Ethnography* (coedited with James Clifford, 1986) is considered one of the most influential texts of contemporary anthropology and is seen as having launched the contemporary critical (sometimes inaccurately called "postmodern") movement in anthropology. In the same year, he published *Anthropology as Cultural Critique: An Experimental Moment in the Human Sciences* (with Michael M. J. Fischer). This text established important theoretical precedents in anthropology and drew attention to the ideas of the critical perspective in anthropology, the repatriation of anthropology, and experimentalism. He later published a retrospective collection of essays on ethnography, *Ethnography Through Thick and Thin* (1998), which included a number of provocations—multisited ethnography, ethnographic complicity, and reflexivity—that would further guide anthropology into the next millennium. Marcus edited the Late Editions annual series (1993–2000)—a collection of critical essays that expressed the complexities of fin-de-siècle issues including nationalism, corporate culture, paranoia, cynicism, self-awareness, cultural change, and the zero state. His work with Fernando Mascarenhas—*Ocasião: The Marquis and the Anthropologist. A Collaboration* (2005)—offered an interesting model of collaboration that challenges the traditional relationships between anthropologists and key informants.

Critical Contributions to Anthropology

Marcus's contributions to anthropology are wide-ranging and seminal. A number of his ideas—including multisited ethnography, ethnographic complicity, anthropology as cultural critique, paraethnography, and the ideas of critical ("postmodern") ethnography that were generated with the publication of *Writing Culture*—continue to inspire professional anthropologists and anthropology graduate students alike.

In *Nobility and the Chiefly Tradition in the Modern Kingdom of Tonga* (1980), *Elites: Ethnographic Issues* (1983), *Lives in Trust: The Fortunes of Dynastic Families in Late Twentieth Century America* (1992), and *Ocasião: The Marquis and the Anthropologist. A Collaboration* (2005), Marcus established an important focus on the cultural dynamics of elites, dynastic families, and nobility. Especially salient is his emphasis on the need for new ethnographic approaches to the study of elites, the concept of eccentricity that is notable among some elites, and the requirement of focusing on elites not as exotic subjects of study but as meaningful sources of cultural information.

Critical Interdisciplinarity

Like Clifford Geertz before him, Marcus has displayed a strong commitment to lessening the disciplinary constraints of anthropology. Marcus's work, especially his edited collection *Writing Culture*, has broadly affected other disciplines that include art and performance studies, cultural studies, sociology, religious studies, architecture, literary criticism, philosophy, economics, political science, and others. In one such example, Cuban avant-garde artists of the 1980s were inspired by the textual, experimental, and critical influences that they discovered in *Writing Culture*, and some went on to produce work that was highly influenced by this collection. While at Rice University, Marcus encouraged and enabled discussions among anthropologists and those of other fields. These discussions included fiction writers and professional performance/installation artists. Another example of Marcus's commitment to the critical interdisciplinarity of cultural anthropology is his editing of the *Late Editions*—an annual series that established critical dialogues and debates among professionals and scholars of many different disciplines and backgrounds. His commitment to interdisciplinarity has angered some critics, who charge that Marcus has lessened the appeal of anthropology; in fact, it may be argued that his commitment has broadened and strengthened the appeal of anthropology.

Anthropological Pedagogy

In Marcus's work as a classroom professor at Rice University and the University of California, Irvine, he has focused on developing critical and engaging classroom seminars. Most notable is a particular proseminar course that he has frequently offered. This class utilizes the work of classic ethnography and contemporary ethnography and juxtaposes both with the context of original graduate student research. In a typical proseminar course, Marcus invites students to reflect on the disciplinary trajectories of these classic and contemporary moments in anthropology as a way of developing and revitalizing their original research projects. Marcus's efforts in pedagogy have had a considerable impact on the professional careers of the students he has mentored.

Anthropology as Cultural Critique

One of Marcus's most significant methodological innovations is his work on cultural critique. In a volume edited with Michael M. J. Fischer (1986), Marcus established a powerful and wide-sweeping paradigm that forced anthropology to seriously reconsider its core assumptions and revitalized important focus on the critical function of anthropology. Marcus and Fischer detail the major cultural shifts that have affected the ways in which anthropologists engage with culture through ethnography, and they suggest significant precedents that have established an "experimental moment" in anthropology. Cultural critique—in one sense an epistemological form that challenges analytical reason and in another a more direct form that focuses on uprooting specific social institutions and cultural forms—has had cultural precedence in the late 19th century, in the interwar years, and in the late 1960s through the present. Taken as a formative approach in anthropology, cultural critique offers new cultural interpretations of the discipline and ethnography, provides important criticisms of the anthropological binaries of "home" and "away," and suggests new modes of criticism within the discipline.

Critical Views of Ethnography

Writing Culture (1986), which Marcus coedited with James Clifford, represented a watershed moment in contemporary cultural anthropology. In a lecture in 1992 (Rice University, Houston, Texas), Marcus explained that, at its most general level, the text and the movement it generated acted as "a radical questioning of . . . ethnography itself as a form of knowledge." The text instituted a critical moment in anthropology that served to

anger some and inspire others. The foundations of Marcus's deep questioning of ethnography included his publication of *Ethnographies as Texts* (1982, with Dick Cushman). What was significant about this piece was its paradigm-setting argument that ethnographies could be viewed as texts. This problematizing of ethnography included overviews of the approaches of realist ethnography as well as the ideals of experimental ethnography and, much like *Writing Culture* to follow, this work emphasized the issue of the authority of ethnographic texts—an emphasis that would have a wide impact on contemporary cultural anthropology. Following this initial work on critical ethnography, Marcus, along with James Clifford, organized the 1984 School of American Research Seminar, which led to the publication of *Writing Culture*. With this work, Marcus helped usher in a new era of critical ethnography. The authors of this collection shared a common concern with the numerous implications of ethnography and the fieldwork project. The classic ethnographies of Bronisław Malinowski, the rhetorical strategies of ethnographers, the issue of cultural translation, and the topic of ethnography as situated within world historical systems are some of the many foci in the text that helped establish an explicit concern with what has been called, often pejoratively by some critics, the "literary turn in anthropology." Since his editing of *Writing Culture*, Marcus has continued to suggest a direction for the future of ethnography and anthropological fieldwork. He has been particularly committed to the development of new research imaginaries that guide the formation of alternative research trajectories, methodological approaches, and reimaginings of the relationship of the ethnographer to the field.

Multisited Ethnography

One of the most influential of Marcus's concepts of contemporary ethnography is the idea of multisited ethnography. This conceptualization of ethnography—what Marcus calls a "research imaginary"—breaks with the notion of the single-site ethnography and instead argues for an ethnography that is composed of multiple field sites. Marcus outlines the possibilities in terms of modes of construction—follow the people, thing, metaphor, story, life, or conflict—and considers the ways in which multisited ethnography resituates the ethnographer as a sort of circumstantial activist, a researcher torn between various fields' sites and contradictory personal and professional commitments. Like many of his other innovations, Marcus's view of multisited ethnography has affected disciplines outside anthropology, and now multisited ethnography has become a popular catchphrase in the social sciences, the humanities, and cultural studies.

Ethnographic Collaboration, Complicity, and Para-Ethnography

In *Ocasião: The Marquis and the Anthropologist. A Collaboration* (2005), Marcus explores the idea of ethnographic collaboration through an extended conversation with Fernando Mascarenhas, Marquis of Fronteira and Alorna. Through a series of 187 e-mails presented in epistolary form, the two critically and collaboratively produce a portrait of contemporary nobility in Portugal. This ethnographic collaboration highlights Marcus's ongoing interest in redefining notions of ethnographic collaboration. In work with the anthropologist Douglas Holmes, Marcus has suggested further redefinition of the ethnographic encounter. In conjunction with his work on multisited ethnography, he has offered the notion of ethnographic complicity—in which the ethnographer and the informant share a common predicament, a realization of being trapped in fieldwork situations characterized by uncertainty and anxiety—and in further work with Douglas Holmes on central bankers, he has focused on the concept of para-ethnography, an emergent form of ethnography that deals with the contemporary complexities of capitalism, globalization, and other systems that have produced a predicament of embedded discourse, overlapping actors, and continued complexities for the ethnographer.

Marcus's Legacy

Given the breadth of George Marcus's work and the influence that it has had within and outside anthropology, it can be said that Marcus is one of the most important figures in the discipline since the 1970s. Marcus's focus on critical views of ethnography, fieldwork, and epistemology continues to influence developments within cultural anthropology and affect the social sciences generally.

Marx, Karl

Karl Marx (1818–1883) is best known as a critic of capitalism and an advocate of class struggle as a means of overcoming the contradictions of the capitalist system and achieving socialism/communism.

Early on, Marx studied law in Bonn and later in Berlin, where his interests turned to philosophy, and he joined the circle of "Left Hegelians," who sought to draw atheistic and revolutionary conclusions from Hegel's philosophy. Throughout his life, he served as editor/journalist/commentator on the events of his day and did not shy away from fierce polemics with his political and philosophical rivals. Marx's early journalistic activities convinced him that he was not sufficiently acquainted with political economy, and he energetically set out to correct that deficiency. His subsequent life combined scholarly work of great erudition in philosophy and political economy with activism in the struggles of the working-class movement of his time, for which his scholarly work provided the raison d'être and for which he was successively expelled from one European country after another.

Beginning in the 1840s, he began a collaboration with Friedrich Engels, which continued throughout his life in both scholarly and political realms. It was Engels who supported Marx and his family during their exile in England in the last days of Marx's life, and it was Engels who posthumously edited Volumes 2 and 3 of Marx's life work, *Capital*.

From 1852 until the onset of the American Civil War, Marx was the London correspondent of the *New York Tribune*. His articles were often extensive serial analyses of the political and economic circumstances of the various countries of Europe, but the arrangement was not especially remunerative.

The London years were mainly devoted to the study of political economy, and Marx spent long hours at the British Museum. But he never completely abandoned practical politics. Marx and Engels were principal movers in the formation of the International Workingmen's Association, the so-called First International, founded in London in 1864. Marx hammered out a strategy for the proletarian struggle of the working class in the various countries of Europe, under which the French Proudhonists, German Communists, and English New Trade Unionists worked together, until the movement was split by the anarchist wing led by Mikhail Bakunin. Marx and Engels also played a role in organizing support for and advising the revolutionaries of the Paris Commune in 1871 and in analyzing its failure in the aftermath.

In increasingly poor health, and following shortly on the death of his wife, Jenny, Marx peacefully passed away in his armchair on March 14, 1883. He lies buried with his wife in the Highgate Cemetery, London.

There are several ways in which Marx's work remains relevant to the conduct of contemporary anthropology, but to open oneself to these possibilities, it helps to separate the excesses of the existing socialist/communist states (which Marx never lived to see) from his analysis of the real existing capitalism of his own time (which remains relevant today).

Marx employed the perspectives of historical materialism and dialectical materialism to mount a kind of anthropological analysis of the capitalist system. More than 100 years later, in the 1960s, in the hands of the French neo-Marxists, his concepts were creatively adapted for use in the analysis of

the precapitalist and postcolonial societies typically studied by anthropologists, and they have subsequently been applied in the field of economic anthropology. In this latter area, the Marxist approach shares some understandings of the human condition with the "substantivist" position of Karl Polanyi and his followers, and it has also been inspirational in the formulation of alternative models of economic development.

Materialism

Marx was first and foremost a proponent of what he called *historical materialism*, a theoretical position that argues that the activities in which humans participate to fulfill their basic material needs will impose certain requirements on the population that, in turn, will determine the range within which the social relations in that society might vary, and influence the range within which the thoughts of its members might wander.

For example, if you grow rice as your basic subsistence crop, the rhythm of your annual activity will be tied to the various stages in the maturation of the particular species of rice that you plant, imposing on you the necessity to perform certain activities at certain times of the year, requiring you to organize your social life and system of belief in such a way as to allow those activities to be performed. Multiple arrangements are possible, as long as they allow the activities necessary to materially provision society to be carried out in a timely fashion.

In this way, Marx made a distinction between the economic base that is determinate of the overall shape of society and the ideological superstructure that arises from that economic base, providing the population with a system of belief that should allow them to reproduce the system as a whole—that is, that strains toward consistency with the requirements of the economic base. The economic base is characterized by a distinct mode of production, which in turn is composed of a particular combination of forces of production (tools, machines, and technology) and relations of production (the organization of humans to put those forces of production to work).

Marx claimed to be an exponent of *dialectical materialism*, which allows that the ideological superstructure (which includes the cognitive and expressive dimensions of social life, religious belief, philosophy, political struggle, art, and music) may from time to time structure the way in which the forces of production and the relations of production are set in motion. For Marx, class struggle, a quintessential superstructural phenomenon, was the motive force of history, the dynamic force that brought about change in the mode of production, and hence change in society as a whole. Marxist anthropology understands class as an important parameter of social inquiry. As regards the dialectical relationship between base and superstructure, the French neo-Marxists have pointed out that in the societies in which anthropologists are prone to carry out research, kinship relations often function as relations of production in the Marxist sense insofar as they play a role in structuring how the forces of production are deployed, and they can therefore be construed as an element of the economic base.

Applied to the pursuit of anthropological fieldwork, a materialist approach (dialectical or otherwise) would give initial attention to those activities most closely tied to the material subsistence of community members, whether hunting and gathering, subsistence agriculture, plantation agriculture, commercial mechanized agriculture, simple commodity production, industrial wage labor, and so on, and to the social relations, whether class or kinship relations, entailed in these arrangements (to the forces and relations of production).

The Analysis of Capitalism

For Marx, industrial capitalism was characterized by several distinctive contradictions, principally the contradiction between the increasingly cooperative, social nature of production under capitalism, and the private ownership of the means of production. He also noted the tendency for competition to eliminate itself, resulting in monopoly, and argued that in the end the competitive and creative impulse of capitalism is self-destructive, leading to repeated crises and ultimately to the demise of the system altogether. It must be admitted in this regard that despite its numerous crises during the past century, capitalism has proved more durable than Marx predicted.

Marx's principal work, *Das Kapital* (*Capital*), is a kind of anthropology of the capitalist system. It begins with an examination of the system's most elementary unit, the commodity. It espouses a labor theory of value, which understands the value of

a commodity to be determined by the amount of socially necessary labor expended in its production, plus an increment of surplus labor imparted to the commodity during the production process. The laborer's wage is determined by the labor power socially necessary to reproduce himself (sufficiently so as to keep him fit enough to return to work the following day), rather than the amount of labor power he actually adds to the commodities he produces during the time he is employed. The difference is surplus value that redounds to the capitalist as profit when the commodity's value is realized in circulation (sold on the market). The surplus labor is disguised in the wage contract, which creates the illusion that the laborer is being paid for his full day's work but in fact hides from him the amount of surplus labor extracted in the process of production for which he is not recompensed.

Marx was at pains to point out that capital is a social relation between members of differently situated classes, not a thing in itself. In 1849, he famously wrote in Chapter 5 of *Wage Labor and Capital*,

> A Negro is a Negro. Only under certain conditions does he become a slave. A cotton-spinning machine is a machine for spinning cotton. Only under certain conditions does it become capital. Torn away from these conditions, it is as little capital as gold is itself money, or sugar is the price of sugar. (p. 25)

Thus, the origin of profit lies in the very act of production, in the relations of production between labor and capital, rather than in the hurly-burly sphere of circulation. Exploitation is concealed in the wage contract, which has the appearance of being a contract between equals. The whole point of Marx's analysis of the capitalist system was to expose its underlying, if often obscured, exploitative character.

Commodity fetishism was Marx's term for the ideological characteristic of people who live in market-based capitalist societies, in which value is seen to reside in objects or commodities themselves rather than being understood as the product of a specified amount of labor power imparted to the commodity in the process of production (including the labor power socially necessary to reproduce the worker, plus an increment of surplus labor that accrues to the capitalist). Commodity fetishism is part of the false consciousness that functions as a kind of blinder disguising from participants the exploitative nature of the relations of production under capitalism.

It is the historical role of the working class (the proletariat) to overcome its false consciousness, understand the system for what it is, and through organized political activity bring about the overthrow of the capitalist system and the creation of a communist system free of exploitation, as expressed in the slogan "From each according to his ability, to each according to his needs." The enormous productivity released by the capitalist system would be sufficient to supply the needs of all members of society if the means of production were socialized, the private profit of the capitalist class eliminated, and goods more equitably distributed.

The French Neo-Marxists

Those espousing Marxist approaches in the social sciences in the United States were, with a few exceptions, purged from academic and political life during the late 1940s and 1950s, when the combined attacks of Senator Joseph McCarthy and various congressional committees charged with uncovering communist subversion succeeded in delegitimizing Marxist discourse and relegating its advocates to the margins of American society.

But in France, where the communist alternative to capitalism was taken more seriously, the academic world was spared such attacks, and in the post–World War II period, there ensued a re-exploration of the significance of Marxist approaches in the social sciences that came to a head in the 1960s and reverberated across the Atlantic to influence American academia as well. In general, the French neo-Marxists favored a more flexible, nuanced approach in their application of Marxist concepts than the Soviet Stalinist theorists of Marx, whose more economic deterministic understandings had dominated the interpretation of Marx's writings up to that point. With some input from French structuralist anthropology, the neo-Marxists adapted the concepts that Marx had devised to analyze capitalism to the analysis of the pre-capitalist and postcolonial societies typically studied by anthropologists. As mentioned above, this included the recognition that kinship relations might indeed function as relations of production, making the distinction between economic base and superstructure in such societies somewhat less clear. But they also reconceptualized

Marx's feudal and Asiatic modes of production as variations of a single, more all-encompassing "tributary" mode of production and wrestled with the possibility that multiple modes of production might coexist in a single society in a given historical period.

Economic Anthropology

The Marxist approach, with its focus on the mode of production, has been most influential in the subdiscipline of economic anthropology, which in its early days was consumed by a debate between the so-called formalists and substantivists. The debate turned on whether, as the formalists contended, humans were to be understood as pretty much the same in all times and all places, as maximizers of utility, always constrained by scarcity to make choices in their allocation of scarce resources to alternative ends, *Homo economicus* incarnate, or whether, as Karl Polanyi argued, the emergence of capitalism in the 19th century was fundamentally transformative of human relations: that human nature was malleable; that prior to the emergence of capitalism, one could not assume that all human behavior was motivated by the pursuit of gain; and that *Homo economicus* was not a human universal. Polanyi was an economic historian, and for him it was anachronistic to assume that human behavior prior to the emergence of capitalism could be understood by employing the tools of an economic science designed to understand capitalism. But it is easy to see why his approach was received enthusiastically in the cultural-relativist environment of American anthropology. Polanyi characterized his theoretical position as the substantivist approach to economics, and he proposed the transactional modes of reciprocity and redistribution as ways of understanding the provisioning of society prior to the emergence of free market capitalism at the end of the 18th century.

Marx was also concerned with the processes by means of which capitalism had evolved out of the institutions of a pre-capitalist, feudal Europe, and he argued for the transformative effects of capitalism on human relations as well. For Marx, those effects were a temporary aberration in human history that would be superseded, and therefore capitalism ought not to be understood as the most potent expression of a universal unchanging human nature. Thus, a Marxist approach might be said to have more in common with substantivism, even while its emphasis on the forces and relations of production in society provides an approach alternative to both substantivism and formalism in economic anthropology. The neo-Marxist reconceptualization of the notion of the tributary mode of production reinforces that commonality with substantivism insofar as the concept bears a distinct similarity to Polanyi's redistributive transactional mode.

Economic Development

The Marxist approach was also inspirational in the critiques of the economic development theory of the 1950s and the 1960s, which resulted in the emergence of dependency theory and world-systems theory. Finding the orthodox development models of the era hopelessly naive in their assumptions, dependency theorists stressed the asymmetrical, exploitative character of the relationships between former colonial powers and their former colonies. Where such relations of dependency existed, one could not expect development to occur no matter how many well-intentioned, locally based aid projects might be tried. World-systems theory represented a further attempt to provide an alternative development paradigm, one that understood the world as a single system, with differently endowed sectors, core and periphery, as a means of revealing the structural obstacles to development in the very relationships touted to foster it. It is precisely in this impulse to reveal the asymmetry and the exploitation obscured in apparently benign relationships between world economic sectors that dependency and world-systems theorists share some affinities with the Marxist approach. They align themselves with the oppressed and the disadvantaged of the system, with the "wretched of the earth."

At present, with globalization already acknowledged globally, one might conclude that world-systems theory has carried the day, but the class perspective that makes dependency theory and world-systems theory a way of speaking truth to power seems absent in the contemporary representation of globalization as a naturalized force in the world.

Conclusion

Despite the flexible adaptation of Marxist concepts by the French neo-Marxists, and the relevance

of these concepts to contemporary economic anthropology and development theory, more recent critiques of Marx have called attention to his Eurocentrism and to the assumptions of the evolutionary theory, which he shared with his contemporaries of the 19th century. It has been questioned whether his characterization of capitalism as a phenomenon unique to 19th-century western Europe was ever appropriate, and certainly his notion of an "Asiatic mode of production" as a stagnant formation lacking the dynamism of the capitalist West has not stood up to more recent scholarship in comparative world history.

Still in all, the present crisis in world financial markets, which began in 2008, makes Marx's understandings of the contradictions of the capitalist system all the more relevant to an understanding of the contemporary world. So long as we continue to have faith in the benign tendency of the market to self-correct, Marxist perspectives will continue to have relevance to understanding the reasons why a world organized on that basis persistently fails to meet the needs of large sections of its population.

Marxist Anthropology

The 1970s saw a set of outspoken antagonistic theoretical positions emerging in anthropology. The most popular and articulate of these positions were Marxist and feminist, which regularly overlapped. Marxist work was energized by the various world rebellions of the 1960s and 1970s, as well as by the massive increase in student numbers and teaching positions in university systems. It was informed by the recent publication in English of anthropologically relevant texts by Marx and Engels that had not been available before, such as the *Grundrisse* and the *Ethnological Notebooks*. The work of the French Marxist philosopher Louis Althusser, who had a substantial influence over a rapidly expanding field of French Marxist anthropologists, was important as a background inspiration too. In America, and for a short while in the United Kingdom and the rest of Europe, world-systems theory, "the development of underdevelopment," "uneven development," and imperialism theories, programmatically affiliated with Marxism through Vladimir Lenin, Rosa Luxemburg, and Lev Trotsky, helped form its wider politico-intellectual environment. In a later phase, Marxian anthropologists took inspiration from Antonio Gramsci via British cultural Marxists such as Raymond Williams and Stuart Hall and from British Marxist historians such as Edward Thompson and Eric Hobsbawm. By 2000, urban anthropology was acquiring a more Marxian twist through the work of the Marxist geographer/anthropologist David Harvey and his French inspirer Henri Lefebvre.

This entry describes three epochs of Marxist anthropology since the 1970s, organized around their guiding paradigms, modes of production (1970–1985), class and hegemony (1985–), and globalization and financialization (1995–). It is not assumed that this is the only valid categorization of the field, or an exhaustive one. For reasons of space, Marxian anthropological work in urban studies, on the neoliberalism issue, on domestic and "petty commodity" production, and in British development studies, for instance, will not be elaborated on.

Marxist theories in the anthropology of the 1970s rejected the assumptions of structural functionalism, culturalism/idealism, and "vulgar" functionalism/"vulgar" materialism, which were

dominant in "bourgeois" anthropology up to the late 1960s. Marxist theories were also explicitly employed to promote global and historical theorization and comparison in anthropology. In the 1980s and 1990s, Marxist approaches were countered and diluted by the increasingly popular Geertzian hermeneutics and forms of postmodernism, which reemphasized relativism, local cultural knowledge, synchronic ethnographic case studies, and the impossibility of "grand historical narratives." "Neoliberalization" of academia and the wider world and capitalist triumphalism after the collapse of the socialist societies in Central and Eastern Europe also powerfully served to both repress and rephrase Marxist positions. Neoliberal outlooks showed a marked elective affinity with postmodernist relativism and the ethnographic turn toward cultural knowledges. The consequent theoretical void was gradually and only partly filled up by French theorists such as Gilles Deleuze, Michel Foucault, and Pierre Bourdieu. Marxian approaches meanwhile were sustained under the less provocative names of "political economy" and "anthropology and history" (although the majority of research under those headings was not necessarily Marxian).

From the emergence of the global justice movement in the late 1990s onward, Marxian positions reemerged in anthropology, though rarely claiming the Marxist mantle in full. They accelerated demonstrably with the start of the financial and social crises beginning in 2007, crises that were associated with neoliberalism and market rule and that could not be seriously analyzed in terms derived from Clifford Geertz, Foucault, or Bourdieu. Interest in (finance) capitalism, class, labor, and dispossession, key Marxian symbols, as well as resistance (not something alien to the Marxist heritage) grew tangibly, inside and outside academia, within and without anthropology. The Marxist geographers David Harvey and Neil Smith were offered Distinguished Chairs in anthropology at City University of New York's Graduate Center shortly after Eric Wolf's death in 1999, and both had a strong though diffuse influence on the wider field. One reason for that influence was the gradual opening toward doing "anthropology at home" in Europe and the United States, as well as the increasing importance of urban studies. If the "tribe" and the peasant had been core symbols of Marxist anthropology in the 1970s, the worker, the urban dweller, the "precariate," and the "surplus population" were the key symbols of the new anthropological Marxisms of the 21st century. These Marxisms were decidedly multiple and showed less deference to classical texts than Marxist anthropology of the 1960s and 1970s. After 2000, the conferences of the large anthropology associations began featuring well-attended sessions again that brought Marxian languages back into circulation.

Modes of Production

Marxist anthropology in the 1970s was primarily concerned with the mode-of-production concept, more perhaps than with understandings of class. Classically, Marxist scholars have made a distinction between the younger and the older Marx. The former engaged with broad philosophical and historical notions, while the latter turned primarily to political economy. But Marxist anthropology in the 1970s emerged out of a reading of what one could call the third period of Marx's politico-intellectual engagements. In the last years of his life, Marx read extensively in the anthropology and history of precapitalist modes of production. He was particularly interested in L. H. Morgan's *Ancient Society* (1877) and in the history of German land tenure. His interests also included India, Russia, and the Roman Empire. In *The German Ideology* (1846), Marx had developed a historical sequence of modes of production. But it was only in this later period, after more anthropological and historical research had become available, that Marx was able to flesh out his vision in more precise historical terms. His intention in reading Morgan and others was to understand the capitalist mode of production more fully as compared with older modes of production. "Primitive communism" was supposed to have reigned over mankind before the emergence of private property, classes, and the state. In this late "ethnographic" period, Marx began to think that there might not have been a necessary teleology or sequence of modes of production from primitive to capitalist. He suggested the possibility that a socialist revolution could occur in Russia without an intermediate capitalist phase, carried through by peasants who wanted the return of the *Mir* (commune) organization of agriculture.

In his notebooks on Morgan's *Ancient Society* as well as in the *Grundrisse*, Marx used his concept

of mode of production in a rather exploratory and eclectic way. For example, the number of modes of production he identified varied between five and seven. Additionally, there are places where he talks about "the association of direct producers" as a submerged mode that regularly occurred in the interstices of various, more hierarchical modes. Marx seems to have used modes of production as shorthand, sufficient for the task of making some key sensitizing distinctions about class relationships, property, and the state in different types of societies, rather than as a fixed evolutionary sequence with sharply demarcated phases.

Some of the less distinguished scholarly discussion in Marxist anthropology, however, took the modes of production as sharp analytic concepts meant to separate historical epochs and types of societies. The drive for global and generalizing knowledge among young Marxists in anthropology in the 1970s was palpable, and fieldwork was slow to catch up with the steep acceleration of theoretical learning that took place as they read Marx. Jonathan Friedman, educated in both France and the United States, later frankly characterized his own and his colleagues' work as "excessively theoreticist."

That theoreticism was a crucial part of French Marxist anthropology, however. And while there was excess, it also led to a higher level of sophistication in anthropology. One of the basic epistemological moves of Maurice Godelier and others was to emphasize the nonempiricist nature (*not* nonempirical) of Marxist inquiry against the common methodological assumptions of British structural functionalism and American neo-evolutionism. Marxist anthropology took Marx's dialectical method seriously. Abstraction did not simply derive from aggregated empirical data. Aggregations were mere empirical abstractions but not theoretical concepts. Theoretical concepts were constructions of the analyst. They were meant to capture the key relations between diverse observable facts and processes within a society and to integrate these into a logical model. Those relations, Marx and the anthropological Marxists believed, determined the mode of movement and the structural tendencies of the development of a society. Knowing a social formation was equal to knowing the modes of movement of such a formation, based on the relations among its parts. The intellectual strategy behind the concept of mode of production did precisely this: It served to discover the relevant key relations and the consequent processes and transformations that were set in motion through the effort to reproduce those key relations within a consequently patterned process of accumulation. Marxist anthropologists such as Godelier and Friedman therefore stressed the contradictions of social reproduction over time often more than production per se.

Modes of production and their dynamics could not just be read off actual empirically observable production processes. They were not reducible to work and tools. Work and tools were part of the observable "relations *in* production"; but a mode-of-production analysis combined these relations *in* production with an analysis of "relations *of* production," which were the social relations of extraction, surplus appropriation, property forms, law, and the state. One could therefore not empirically separate the base from the superstructure within a social formation in a rigorous way. Base and superstructure were *analytically* distinguishable "structures" or "levels," not separable chunks of an observable reality. Researchers could not a priori be certain what the infrastructural aspects and what the superstructural aspects of a social formation should be. Godelier and others rejected categorically the projection of the key Marxist division of base and superstructure onto "primitive" and precapitalist societies. This categorical distinction between different institutional levels was the exclusive historical property of capitalist society, the property that had enabled Marx to actually discover "the base" and the preeminent function of labor and "economics" within social reproduction. But for precapitalist societies, still the specialist object of anthropology in the 1970s, this was misleading. The base or infrastructure was held to be an "articulation of those levels of a social formation" that together served to secure the reproduction of a mode of production over time. Labor was by definition a part of it, as capitalism had taught us, but so could be kinship, law, ritual, and cosmology.

A key critique of the Marxists against British structural functionalists concerned the idea that kinship, not economics, determined behavior in "primitive" societies. Rather, the Marxists argued, kinship appeared dominant precisely because it organized the key reproductive functions of primitive modes of production. Kinship was a "generalized institution" and therefore appeared dominant. But the

economic infrastructure, which it encapsulated, was determinant.

The mode of production, then, was the opposite of a reductionist notion. This is in contrast to the ideas of economy and action that prevailed in neoevolutionist, economic, and ecological anthropology, which were often derived from a straightforward liberal notion of rational action. Of the proliferating Marxisms of the 1970s, Marxist anthropology was programmatically among the least reductionist. Its mode-of-production concept was also both more precise and less empiricist than the substantivist notion of economics springing from the work of Karl Polanyi.

Marxist discussions in anthropology excelled when they set out to discover complex historical combinations of modes of production within one social formation. Such studies focused on discovering the logics of accumulation, the consequent contradictions of social reproduction over time, and the transformational logics suggested by them. Thus, Godelier (1977) criticized Marshall Sahlins's research on "the familial mode of production" for confusing class-based with classless modes. He rejected Sahlins's distinction of band-based, tribe-based, and "chiefdom-based" societies within the larger category of one "familial mode of production" as based on misguided empiricist methods focused merely on "relations *in* production." He argued that with the transition from tribal organization to hereditary chiefdoms, one is confronted with the emergence of class-based societies and the state.

Marxist anthropologists such as Godelier and Friedman were particularly good at increasing our insights into the overlapping dynamics of chiefdoms and Asiatic modes of production. Godelier analyzed the Inca civilization as a social formation dominated by an Asiatic mode of production. At its apex was a theocratic state–bureaucratic complex organized by a surplus-taking hereditary ruling class, which claimed exclusive property over all territory. The state extracted forced labor dues from village-based lineages, whose communal modes and rituals were superficially left intact. However, these had acquired fundamentally different functions by now, serving the sun god and his son, the Inca ruler.

Friedman's modeling (1998) of key relations of social reproduction among the hill dwellers of Southeast Asia demonstrated the precise contradictions of such societies. These contradictions led to a systemic sequence of change, transformation, and finally devolution and collapse. Friedman thus showed the actual logics behind the oscillation of horizontal (*gumlao*) and hierarchical (*gumsa*) social relations in the uphill societies of Burma that Edmund Leach had first analyzed. Leach saw this oscillation as an alternation between opposed cultural ideals, basically explained by happenstance and cultural choice. Friedman argued that all societies in the region, not just the Kachin described by Leach, went through similar though not necessarily synchronized sequences. *Gumsa* chiefdoms would emerge from the successful accumulation of resources, producing court societies with elaborate festive rituals around increasingly sacrilized chiefs. This came close to an Asiatic mode of production as described by Marx, with sharply polarized class relations between rulers and villagers. But at some point, hard limits to further development would be reached by the sheer limitations of resources in land and labor. Such limitations would then lead to an overstretching of noble claims, the decline of deference, the collapse of courts, and a fracturing of social relations and institutions. Thus, the horizontal *gumlao* model of more or less independent clusters of peasant households would return at the end of the cycle, after which hierarchical accumulation would start anew. Friedman suggested that similar processes underlay comparable cycles in China, but with higher limits on accumulation. Leach's original observations were now provided with a materialist explanation, but the notion of Asiatic modes as essentially static, durably class polarized, and lacking the characteristic middle layer of propertied entrepreneurs who had presumably led Europe on its path to capitalist growth was rejected as a Eurocentric fantasy.

By the later 1970s, the limitations of Althusser's "structural Marxism" were becoming obvious. In particular, critical anthropologists were increasingly rejecting its assumption of discrete and bounded societies as basic units of analysis—an assumption that it in fact shared with much of the anthropology of the era. In France, anthropological interest was growing in the work of Samir Amin. Anglophone anthropology was inspired by the work of André Gunder Frank and Immanuel Wallerstein, offering a fresh transnational perspective not only on capitalism but also on society in general. Anthropological languages of Marxism were changing as a consequence

of this transnational turn. The concept of articulation, for example, began to refer increasingly not only to the articulation of levels or structures within a territorialized mode of production but also to the articulation of modes of production throughout space. This was particularly evident in discussions of the articulation of capitalism with other modes of production such as feudal modes (often in reference to Latin America) and "domestic modes" (Africa).

In *Peasant Wars of the Twentieth Century* (1972), Eric Wolf had developed a transnational and imperial perspective on peasant resistance and Third World revolution. *Europe and the People Without History* (1982), Wolf's magnum opus, now universalized this approach. While remaining within the orbit of modes-of-production analysis, Wolf started his book with a chapter on "connections," showing the intensity of exchanges among different people and cultures before the emergence of the modern world system, which would further accelerate as well as reorient (in fact "re-occident") such connections. In a series of rich historical chapters, he then analyzed how European world economic expansion subjected the societies it encountered to its own commercial and capitalist exploits. He showed in detail how it thereby unsettled and transformed their internal relations in ways that varied from drastic to genocidal, all along criticizing earlier anthropological ideas of isolated and "history-less" societies.

Consciously moving away from the Althuserian theoretical framework, *Europe and the People Without History* was arguably—and paradoxically, given Althusser's initial role—the culmination of a decade of Marxist anthropological research on modes of production. While the book should probably be read first of all for its rich historical understandings, it contained significant further Marxist theorizing on modes of production. Wolf took Marx's conception of modes of production in the loose spirit that Marx himself seemed to have preferred. Referring to "key relationships" in the deployment of social labor (*in and of production*), he reduced the five to seven modes that Marx had distinguished to just three: (1) a capitalist mode, (2) a kinship-based mode, and (3) a tributary mode. He also refused to imply a necessary teleology among them. The Asiatic mode was brought together with feudal modes in the single-umbrella concept of the tributary mode. This allowed for the oscillation between more centralized and more decentralized phases in the development of tributary systems such as Friedman had suggested. Wolf also made an explicit claim for understanding the capitalist mode as only beginning with the actual domination of capital over the sphere of production: that is, with the coming of the factory system in late-18th-century England.

While the aligning of feudal and Asiatic modes into the one concept of the tributary mode has been of enduring theoretical value, the limitation of the capitalist mode to factory-based social production was in retrospect a less productive maneuver. For one, right at the time of Wolf's writing, Western capitalism itself started de-industrializing and financializing, giving rise to new formations of surplus populations and to the de-proletarianization of modern social structures. More generally, it seems that much of Marxist writing in anthropology and history had underestimated the sheer relevance of property and finance, including large-scale speculation and credit-debt structures, all throughout post–Bronze Age history, including the imperial political forms necessary to sustain and foster them. If capitalism had to be sharply demarcated from what came before, a different approach was required (see below).

However, Wolf's vision of the making and remaking of working classes within an ever differentiating, recompositioning, and respatializing world capitalism, as evinced in the last chapter of his magnum opus, proved enormously enabling for the emergent anthropological study of labor in modern capitalist habitats. This crystallized in the 1980s under different headings (also see below) and acquired new vigor after 2000 as the "new anthropology of labor."

Class, Power, and Hegemony

The work of Wolf and the structural Marxists was strongly criticized within fieldwork-driven anthropology for its prevailing macro-institutional and macro-historical orientation. Anthropology, specializing in research in micro settings, offered robust internal barriers to the world-historical agenda of the Marxists, even though that agenda anticipated the tasks of the social sciences in a rapidly globalizing capitalist world rather well. Such criticisms also served to clear the way for a renewed wave of culturalism that privileged the study of how particular people felt and thought about themselves rather

than seeking to explain those thoughts, let alone the course of human history.

The critique was not entirely unfounded. Whatever the quality of Wolf's insights into particular cases, *Europe and the People* featured few genuine efforts to get close to popular experience. This was partly the consequence of the effort to paint such a macroscopic canvas, partly the effect of the mode-of-production agenda itself, which remained profoundly macro-institutional. Marxian-inspired authors in the New Social History, emerging in parallel with Marxist anthropology, had privileged class, class struggle, "social being," and "experience" rather than more formal modes-of-production analysis. For example, Edward Thompson rejected Althusserian intellectualism and structuralism in *The Poverty of Theory* (1978) and had superbly shown in *The Making of the English Working Class* (1963) that a much more ethnographic and existentialist alternative was available. Raymond Williams and Stuart Hall had demonstrated how Antonio Gramsci and Valentin Volosinov could be used for contemporary sociocultural analysis of British youth cultures, working-class cultures, and the emergent populist authoritarianism of Margaret Thatcher. A younger cohort of left-wing anthropologists from the mid-1970s onward built on these examples to articulate an alternative Marxian anthropology, one that sought to develop a radical ethnographic style without losing the vital Marxist interest in power, history, and space. Class, hegemony, and avoidance/resistance/protest as forms of culture making in densely situated contexts of inequality and power/powerlessness became its key tools. Its underlying methodology was "relational realism." Making their academic careers in the neoliberal 1980s and 1990s, these scholars preserved Marx by retuning his heritage under respectable academic labels such as "anthropology and history," economic anthropology, and "anthropological political economy."

While mainstream anthropology went looking for the Geertzian "webs of meaning," Marxian anthropologies of class sought to expose what Ingmar Bergman once called "the tissue of lies" that informs lives and biographies in class societies. Hegemony however was not primarily about "ideology." Rather, it was about whole ways of life structured by territorially ingrained power relationships of capital, state, and class. Analyses in this vein were often multiscalar in Wolfian fashion, seeking what Don Kalb (2010) called the "critical junctions" connecting global capitalist geographic power frames with national histories and locally situated historical structures of accumulation and everyday life. They made a determined effort to assemble dense local ethnographies and reveal the silences, inversions, rationalizations, concessions, confrontations, and so on, of hegemonic and relational power fields. Where the New Social History had found agency and self-conscious historical praxis, Marxian anthropologists often found contradictory social ties of dependence, deep ambiguities, and unhappy though proud evasion.

Three works provide good illustrations of this ethnographic Marxism. They also show the partial shift in anthropological locations from the tribes and peasants of the South to the small producers and working classes of the West/North, which was selectively ongoing in this same period.

Gerald Sider's *Culture and Class in Anthropology and History* (1986), a study of Newfoundland outport fishing settlements, is set in a long time frame of British mercantile capitalism that did not penetrate into the sphere of production as required in Wolf's view but that thoroughly shaped fishermen's lives nevertheless. Fishermen were forbidden to hold land in this crown colony. They depended on advances from mercantile agents for their livelihoods, both for the procurement of food and tools and for the sale of their fish. They lived in dispersed communities of isolated households in a harsh climate antagonistically integrated into a centralized mercantile monopoly. Unable to influence the terms of trade, they were dealt with by the agents on an individual basis. This included, for some but not for others, being left to starve in the long winters. Sider traces the contradictory and idiosyncratic socialities and social rituals that developed within this set of forcefully exploitative relations of "community." His fishermen, later under Canadian administration, were fighting "within and against their own histories." They refused to believe in the possible benevolence of any sovereignty over them, evaded imposed order, but also finally failed to find a common voice to speak to the Canadian state, which dismantled their societies when the cod fisheries became unprofitable and welfare too costly.

In *Immediate Struggles: People, Power and Place in Rural Spain* (2006), Susana Narotzky and Gavin Smith trace a 20th-century history of class conflict in the Vega Baja, near Valencia, Spain. The Civil

War and the consequent Francoist repression had served to thoroughly destroy trust in public authority. Dispersed workshops were augmented by home industry networks. Such networks exploited (and favored) female kinship connections, thus colluding exploitation with family and friendship and making social ties both strong and fragile. This left workers vertically dependent on employers, middlemen, and their blackmailing tactics—tactics that were subtly fine-tuned into the post-Francoist welfare state. The European Union, meanwhile, had helped transform a cohort of local critical left-wing researchers and politicians into project proposal–writing professionals, while the local commercial media kept celebrating the advent of "European modernity." As in Sider, hierarchically nested scales of power and "struggles within and against one's own histories" were brought together in one dynamic ethnographic picture, both intimate and analytic.

In *Expanding Class: Power and Everyday Politics in Industrial Communities, The Netherlands, 1850–1950* (1997), a study of a key modern factory community in Eindhoven, the Netherlands, Kalb analyzed how daughters were exploited by a hegemonic alliance of working-class fathers and employers, encompassing the plants and neighborhoods of Philips Electronics, as well as the urban public sphere at large. This exploitation ensured high productivity, optimal flexibility, and sustained accumulation in a light export-driven industrial region in a country thoroughly exposed to international competition and market movements. It also safeguarded parental status, family accumulation, and political quiescence. Kalb highlighted important distinctions within the urban industrial capitalist mode of production. He contrasted Fordist and "flexible familist" ensembles and traced in detail the contradictory consequences for gendered local lives, culture, and politics. Eindhoven in fact prefigured the massive light-manufacturing outlays on the East China coast. As in Eindhoven, they sought to recruit girls' labor from and within paternalist environments, a capitalist patriarchy that would encapsulate the geo-economic and geopolitical shifts of the 21st century, which globalization was all about.

Combining Wolf, Thompson, Eric Hobsbawm, and Gramsci, and, after 2000, increasingly David Harvey, the class-power-hegemony paradigm within Marxist anthropology showed in meticulous detail how whole lives, friendship and kinship networks, and community "cultures" were both energized and emptied by particular regional integrations within globalizing capitalist modes of accumulation. These studies thus laid bare particular "spatio-temporal" fixes (Harvey) of life under capitalism, producing rich and dynamic accounts of the accordant social and cultural relations and the political and existential struggles that animated them. In fact, such studies grasped the complexities and immanence of class in ways that went far beyond classic Marxist or liberal understandings.

Globalization and Financialization

Over time, ethnographic Marxism of the class-and-hegemony school increasingly overlapped with a third stream of work in Marxist anthropology focusing on globalization and financialization. Like Wolf and others, Jonathan and Kajsa Friedman had in the 1970s already proposed a globalist/transnational mode of research. However, their temporal scope was far larger even than Wolf's, and their data were less detailed, which made them vulnerable to rejection by the anthropological mainstream. They built eclectically on the spatialized Marxism of Rosa Luxemburg to construe a universal cyclical model of core-periphery development of a distinctly anthropological kind. All through human history, dynamic urban cores had formed around military, court, or temple complexes. They had imposed divisions of labor over their hinterlands and had exerted assimilative cultural hegemonies over dispersed populations as well as urban migrants. Increasing local price and wage levels, however, turned dynamism at some point into stagnation. If that happened, these hegemonic modern centers "financialized": Their elites made their assets liquid and began exporting capital and know-how to new competitive centers. These urban elites "cosmopolitanized" and exported their "cosmopolitan" cosmologies to new areas and alliances. Rather than assimilating incoming migrants and dominated populations into the modern and urban civilization of the center they had built, such financializing elites would begin to reject common local civil belongings, restrict the claims of (fictive) kinship, and increasingly draw boundaries between a hereditary cosmopolitan class and the localized plebs. Friedman's examples came from circum-Mediterranean archaeology and the contemporary West.

Here was a comprehensive anthropological model of globalization, financialization, class, and culture change. In fact, it predated Giovanni Arrighi's discovery of the historical rhythms of financialization, which would play a key role in the Marxist political economy of crisis and globalization. After 1989, Jonathan Friedman in a series of publications claimed that what was "emically" understood as the globalization of the West into the "one world" of the first President Bush was in fact a financialization plus cosmopolitanization of erstwhile national elites within a U.S.-dominated core that had shifted from industrial to financial, speculative, and fictitious accumulation. This argument accorded broadly with Harvey's notion of flexible accumulation combined with urban spectacle and with Fredric Jameson's idea of postmodernism as the late capitalist cultural logic, but it added important anthropological accents about the cultural dynamics of class-driven social change.

For one, it allowed Friedman to reject the cultural-globalist school in anthropology—authors such as Arjun Appadurai and Ulf Hannerz—for taking appearances and elite discourses for realities. Rather than cultural diffusion from the center leading to a hybrid world culture, he argued that a declining West, exchanging its hegemonic modernism for postmodern, traditionalist, and indigenist cultural affections, is confronted with an accelerating East, developing its own modernisms. In his vision, cosmopolitanism and multiculturalism were elite-class ideologies obscuring the real processes of "double polarization," polarizations of a cultural and social kind. Localized workers and migrant populations in the declining Western cores were increasingly being reduced, in representation as well as fact, from Fordist working classes to ethnicized and plebeian "*classes dangereuxes*." He was broadly seconded by authors such as Gavin Smith, who approached financialization as the strategy by which a new, post-Fordist dominant bloc in the Gramscian sense "captured" once sovereign democratic states and publics—in particular their "surplus populations"—thus ensuring that their reproductive energies were locked in and creamed off. On the basis of a collection of urban/regional case studies in Europe, Kalb and Gábor Halmai argued that the neo-nationalist turns in postsocialist and post–welfare state popular politics must indeed be understood along the lines suggested by Friedman. Cosmopolitanizing elites in Europe saw their nemesis after 2000 in nativist mobilizations against their policies and hegemonic claims. In fact, these authors argued with Slavoj Žižek that this was the return of the repressed issue of class, but now in illiberal ways. Neo-nationalism was aimed against the *classes dangereuxes* of Roma and immigrants, as well as the rapacious transnational elites who sponsored globalization and multiculturalism. Neo-nationalism brought class back in a political conjuncture where the Left had all but sold out to neoliberal capitalist demands, accepting forms of dispossession and disenfranchisement that had hollowed out the mass democracies and imagined popular sovereignties of the postwar period.

In the wake of the financial crisis (2007–), Marxian anthropology seemed to be coming full circle. There was not only a noticeable rise in interest among anthropologists. Also, a synthesizing of the three paradigms discussed here appeared in the offing. Kalb, in a symposium on Friedman's "Anthropology of Global Systems" in *American Ethnologist* (2013), argued that his conception of financialization was too universal, covering all "commercial civilizations." It was also too much based on Max Weber's notion of "abstract wealth" and not sufficiently attuned to the relational and institutional specifics of capitalism as a transnational space-making project. Relying on new historical research by, among others, Jonathan Israel, Kalb dated the origins of capitalism as a mode of social reproduction precisely to 1688, the year of the Dutch military capture of England, since then mystifyingly called the "glorious revolution." The occupation resulted in an emergent Protestant territorial empire annex world system constructed around the purposefully created Bank of England. After 1688, "endless accumulation" was facilitated by the recycling of Dutch and other surpluses via Amsterdam into the Bank of England and the British state debt. The ensuing "financial revolution" allowed the British state to accumulate debt cheaper than any other unit by rerouting financial capital into the profitable making of a transatlantic space of flows, and increasingly a trans-world space of flows, just as Genovese financializations had driven the Iberian globalizations of two centuries earlier. This led to the making of new human habitats—based on slave, contract, bonded, or free labor, as described by Wolf—now entirely entangled in capitalist debt and accumulation relationships. Kalb argued that rather than being about

"abstract wealth" this was about the forceful and violent making of capitalist space, capitalist national states, legal systems, and social and institutional relationships. This financialization-driven pattern of imperial capitalist space making was once more repeated after 1989. In a reply in the same issue, Jonathan Friedman and Kajsa Ekholm Friedman accepted the charge by saying, "We were Weberian but for Marxist reasons" (Friedman, 2013, p. 253).

Material Production, Theories of

Few topics are more controversial in anthropology than theories of material production. They span the entire scope of human history and prehistory, from the first use of tools to computerized trading. The bodies of *Homo sapiens* have been formed in relation to material production or "making a living." For example, human canines have been reduced in size in part due to the use of fire and weaponry. Bipedalism, an adaptation preceding the emergence of *Homo sapiens* by several million years, has been tied to sharing food, pair bonding, and the gender division of labor. Thus, theories of material production are also theories of human nature and are inextricably tied to political understandings.

Early anthropological theorists have been labeled "unilineal evolutionists" as they linked types of material production to universal stages of human culture. In *Ancient Society* (1877), for example, Lewis Henry Morgan described all human societies as falling into the following categories:

> *Savagery:* in which humans scratch out a living through what we now call "hunting and gathering" using crude tools in a direct relationship with "nature"
>
> *Barbarism:* in which humans learn to domesticate plants and animals
>
> *Civilization:* in which humans engineer sophisticated productive systems, writing, and the arts

Karl Marx and Friedrich Engels relied heavily on the work of Morgan and the other evolutionists in developing "historical materialism," which proposed that all human social and cultural life is, in the last analysis, determined by modes of material production. In *The Origins of the Family, Private Property, and the State* (1884), Engels tied family form and the development of inequality to modes of production and argued that monogamy would only be truly voluntary given the future rule of the working class in a socialist society.

Twentieth-century anthropology turned away from the grand theorizing of the evolutionists and their reliance on the reports of missionaries and

colonists. They emphasized careful collection of firsthand data through ethnographic fieldwork. American anthropology, under the influence of Franz Boas and his students, such as Margaret Mead, focused on close description of particular traits of various cultures without identifying a material productive basis to explain these traits. Their work has been labeled "configurationalism" as they sought to describe cultural systems as radically diverse and unique configurations. For example, the competitive gift giving or "Potlatch" of the Pacific Northwest tribes was described in great detail by many ethnographers but was not explicitly tied to productive or political change. However, in describing the enormous variation between cultures, these anthropologists undercut the claims of classical economics, which posited a universal "rational," profit-seeking human nature.

British anthropology in this period was also devoted to careful ethnographic fieldwork. Bronisław Malinowski's *Argonauts of the Western Pacific* (1922) described the *kula* trade system of the Trobriand Islands, tying trade to cultural values, magic, and status. British anthropology was theoretically "functionalist," situating particular practices within an overall cultural system described synchronically (in the present) rather than diachronically (developing over time). Like its American counterpart, British functionalism did not identify modes of production as the key determinative variable in explaining pieces of a cultural whole.

The 1940s and 1950s saw a revival of interest in historical change and material explanation. Leslie White's *The Science of Culture: A Study of Man and Civilization* (1949) identified three interlocking levels in all cultures. White claimed that the "technological" level was the basis of cultural evolution and determined the "sociological" and "ideological" levels. This very closely replicated the Marxist understanding of the "infrastructure" on which rested the social "structure" and ideological "superstructure." However, because of the atmosphere of anticommunism prevalent in the period, White did not credit Marx and Engels. White asserted that the purpose of technology was to capture energy for human interests and that as a society captured increasing amounts of energy, it evolved in complexity.

Of more lasting influence has been the "multilineal evolutionism" of Julian Steward. Steward also argued that cultures and individuals are largely defined by how they make a living, and he carefully situated these productive practices within particular environments. Steward's work is considered the foundation of "cultural ecology," a project that continues to the present, and is summarized in Steward's *Theory of Culture Change: The Methodology of Multilineal Evolution* (1955). Influenced by Steward's approach, Roy Rappaport analyzed the role of ritual in material production in his classic *Pigs for the Ancestors: Ritual in the Ecology of a New Guinea People* (1968). Rappaport argued that societies should be analyzed as populations in dynamic interaction with specific environments. The contrasting approaches of White and Steward reflect the now defunct formalist/substantivist debate that raged in the 1960s. The formalists argued that Western models of economic development could be applied universally, while the substantivists argued that these models applied to capitalist economies only and that cultures needed to be understood on their own, unique terms.

Contemporary theories of material production have been strongly influenced by the anticolonial and other political struggles of the postwar period and the 1960s. One of Steward's students, Eric Wolf, argued in *Europe and the People Without History* (1982) that no culture can be understood as an isolate outside the global economic system. Many ethnographers are currently conducting fieldwork in the factories that have moved from the Western "core" to the "periphery" (the so-called Third World). Applied anthropologists deploy world-systems theory in their work with Indigenous peoples and the World Bank, the United Nations, NGOs, and micro-lending institutions. Following the influence of the feminist movement of the 1970s, current anthropological theories of material production are also concerned with gender divisions of labor and the impact of development on women. Finally, postmodern approaches analyze and even deconstruct the very discourse of "theories of material production," often criticizing the "productivist" biases of the language deployed by Western and anthropological terminology.

Still, universalist descriptions of ways of making a living organize many anthropological textbooks, placing societies into the productive categories of *hunting and gathering*, *horticulture*, *pastoralism*, *agriculture*, and *industry*, tying this (implicitly or explicitly) to political categories of *bands*, *tribes*, *chiefdoms*, and *states*.

Mauss, Marcel

Marcel Mauss (1872–1950) was a French anthropologist and a prominent collaborator in the *Année Sociologique* from its start. He became the leading figure in French anthropology between the wars and has been an inspiration to many researchers.

Career and Personality

Born in Épinal (Vosges) in eastern France, Marcel (Israël) Mauss received a Jewish upbringing but soon abandoned the faith. His mother's brother was the great sociologist Émile Durkheim (b. 1858), and at the age of 18, Mauss went to Bordeaux to study philosophy and sociology with his uncle. Planning to specialize in the anthropology and sociology of religion, he moved to Paris in 1895 to study Indology under Sylvain Lévi, at the same time following courses in Avestan language, Indo-European philology, Hebrew, and nonliterate religions. During 1898–1899, he continued working on Sanskrit ritual texts in Holland and England and soon afterward began lecturing on Indian religions and philosophy. He was on affectionate terms with Lévi, whom he called his "second uncle" and whose influence on his own life and work is being increasingly recognized. However, he also collaborated closely with Durkheim, helping him set up the *Année Sociologique* in 1898.

In 1902, Mauss started lecturing at the École Pratique des Hautes Études on the religions of "non-civilized peoples"—a title he disliked. Intending to write his thesis on prayer, he often lectured on "oral ritual" among native Australians, but he also covered many other ethnographic areas. At the start of the First World War, he volunteered for the army and served as an English interpreter. The period of the war saw the death of many of his students, as well as of Durkheim. Afterward, with varying success, he took on a very heavy load. Apart from pursuing his own research in multiple directions, he edited and brought out unpublished texts left by his deceased colleagues, relaunched the *Année Sociologique*, and generally tried to continue the tradition of Durkheim and serve as leader of the French social sciences. He also took on further lecturing, from 1926 at the Institut d'Ethnologie (which he helped found) and from 1931 at the Collège de France (to which he was elected). He retired at the start of the Second World War, and although he survived the Nazi occupation of Paris, he lost the will, and eventually the capacity, to write.

Unlike his rather puritan uncle, Mauss enjoyed many aspects of life. He took pleasure in the arts, in climbing mountains, in conversation with students, and in friendships with scholars both at home and abroad. He also enjoyed female company, though he did not marry till he was in his 60s and had no children. A moderate socialist, he devoted considerable time, energy, and money to supporting the cooperative movement. His versatility took its toll, and he received many, almost despairing letters from Durkheim reproaching him for delays in his contributions to the *Année* and for not finishing his thesis. This was not the only project he failed to finish.

Mauss's Writing

Although he never completed and published a single-authored book, Mauss's list of publications in the standard biography runs to 55 pages, and even this list omits his shortest notices in the *Année* and his course summaries. In 1909, he republished

as a book three older essays in religious studies, adding only a new introduction, but this was coauthored with his close friend and collaborator Henri Hubert. In 1947, his *Manuel d'Ethnographie* (*Manual of Ethnography*) was prepared by his student Denise Paulme, who compiled it from student lecture notes taken during his annual course at the Institut d'Ethnologie; however, at the end of the academic year, the course was never completed. What have appeared as books in English were originally essays or "sketches" that he published in journals or elsewhere, if indeed he published them at all. A few significant contributions only appeared posthumously—for instance, his 1920 draft toward a projected book, *The Nation*, or his useful "Intellectual Self-Portrait," written to help those who proposed him for the Collège de France. In French, most of his scattered writings have been consolidated into five substantial volumes.

It is difficult to come to terms with such a fragmented and wide-ranging oeuvre, and there is little consensus about how best to do so. One approach is to focus on his best known text, *The Gift*, and then add comments on other texts that happen to have been translated or to have attracted one's interest. However, he himself in 1930 presented his work as a whole, teaching alongside writing, scholarly collaboration (in which he believed deeply) alongside individual signed texts, one genre alongside another. His ideas in fact crosscut the forms in which he expressed them—reviews (which he preferred to call "analyses"), notes of various types, obituaries, published interventions in debates, unfinished drafts, and full-scale lectures and articles. He did not wish to produce a system or synthesis, conceiving of his research as the discovery of social phenomena (i.e., "social facts," *faits sociaux*) and of theorizing as essentially an aid to discovering new ones.

Since Mauss never undertook what would now be counted as fieldwork, he was not obliged to specialize geographically and could allow his voracious curiosity to roam the globe. In a sense, his immersion in Indology substituted for fieldwork, forcing him to wrestle with difficult concepts in an exotic language. At the same time, it deepened his awareness of history and historiography—he once referred to his field as "the comparative history of societies and especially of religions." His geographical and historical range is well exemplified by his reviewing (which included books in half a dozen modern European languages, not to mention French and Latin).

Thematically, there are few fields covered by the *Année Sociologique* that he left untouched. At the "hard-science" end of the anthropological spectrum, he helped Durkheim with the quantitative data for his *Suicide* and stressed the importance of statistics and demography (often treated under "social morphology"); he also valued ethnographic museums and the study of techniques. At the other end, his first paper concerned the origins of the distinction between civil and criminal law, and he was at ease discussing myth, cognition, and theory. The *Manual* covers fieldwork methods, including photography and film, and moves gradually from material culture to religion, with substantial treatments of aesthetics and law (which he understood in a broad sense as including much of kinship). Although addressed originally to those likely to find themselves in a position to add to ethnographic description, the *Manual* embodies a good deal of Mauss's theoretical thinking.

World-Historical Dimension

Even when evolutionism went out of fashion in social anthropology, Mauss retained an interest in the world-historical aspect of social phenomena. Several of his best known texts are articulated by the implicit culture-typological schema: tribes/archaic literate civilizations/modern West. The first category was often split into the more conservative ("primitive") Australians, while the second referred mainly to India, China, the Greco-Roman world, and medieval Europe. Thus, *Primitive Classification* (written with Durkheim) starts with totemic Australia, where the division of the tribe into socio-structural units correlates with, and (they propose) leads to, the divisions of the rest of the cosmos. After exploring similar but more elaborate systems in tribal North America, the text moves to China, where clans no longer relate to the rest of the classification but correspondences remain between other domains. Such correspondences—say between regions, colors, and elements—are absent from the scientific worldviews that have recently developed out of the earlier classifications.

Thirty-five years later, the argument of *The Person* follows a similar course. It starts in North America with the Zuni and Kwakiutl, loops back to

the less detailed material from Australia, treats the literate civilizations briefly, and ends with the philosophers Kant and Fichte. Mauss's unfinished projects on prayer and "substance" were intended to follow the same schema. The essay on Magic, written with Hubert, follows it not in its argument but in its listing of sources.

Mauss's world-historical thinking is apparent in some of his other typologies. In *The Nation*, his fourfold schema recognizes acephalous tribes, clan-based tribes with a political elite, diffusely integrated societies (the stronger central power now outweighing the clans), and finally the nation proper; and Mauss looks ahead to international organizations. Among religious phenomena, dietary prohibitions (as in totemism) have tended to decline, sacrifice characterizes the middle range of development, and prayer has tended to flourish. Again, early societies were characterized by "total prestations": the exchange of goods, services, and women (etc.) between groups or categories, each exchange being theoretically spontaneous and voluntary but in fact obligatory. Such systems may become competitive or agonistic (the main topic of *The Gift*), before yielding to the market, with its individual contracts and ideology of maximization.

Classification and Categories

Like any discipline, sociology needed to classify the phenomena it covered, and the organization of social facts was a continuing theoretical preoccupation for Mauss. It was also a practical issue, affecting the division of labor among contributors to the *Année* and the structure of the lecture course that became the *Manual*. Mauss was particularly sensitive to phenomena that crosscut traditional divides such as religion, law, and economics: Total prestations belonged simultaneously to all three (and others). Thus, he came to recognize a category of "total social facts" and thought hard about how to organize the rubric "general sociology."

A society consists not only of people on a territory and their ways of behaving (institutions) but also of ideas ("collective representations"); and one approach to classifying basic ideas was to start from Aristotle's list of categories. In *The Person*, Mauss uses tribal ethnography to set up a starting point for the category. The prototype conception is, roughly speaking, a male clan member who bears a name and soul that incarnates regularly within the clan and who ritually dances out his identity with the mythic founder of the clan. The essay links this prototype to the (in principle) liberated individual who has the rights and duties of a citizen in a modern nation-state, and in that respect is homogeneous with other citizens.

Primitive Classification tackled Aristotle's categories of class and, in part, space. Its argument gains clarity if one distinguishes intradomain and cross-domain classification. It is not primitive to classify society into component groups, animals into species, or the year into seasons. What modern thinking rejects is cross-domain classes, whereby one clan (or socio-structural unit) is associated with its totem, season, and so on, and contrasts with other clans and *their* associations; for us, the members of a class belong to a single domain. The other Aristotelian categories that Mauss talks about are time (studied by Hubert), cause (which he connected with magic), number, substance, and totality (which he saw as the central topic of Durkheim's *Elementary Forms*). Though Mauss never says so, *The Gift* can be read as studying the Aristotelian category of relation. However, he also recognized non-Aristotelian categories, some ancient and faded, others recent—for example, chance.

The Edges of the Social

Being interested in sociology *as a whole*, Mauss liked exploring the borders of the field. His Indology equipped him for the border with philology and religious studies, and *Sacrifice* is still admired by Vedic specialists as well as anthropologists. His interest in categories and his criticism of figures like Lucien Lévy-Bruhl and Ernst Cassirer took him toward the philosophy of mind and what might now be called cognitive studies. He was particularly drawn to the borders with biology and psychology. Thus, his classic *Techniques of the Body* explores cultural differences in phenomena like gait, gymnastics, swimming, breathing, and making love. He was particularly pleased by the insight that these activities, apparently belonging to physiology, can be classified under the rubric "techniques," along with pot making and carpentry.

At the start of Mauss's career, sociology was still fighting for recognition as a discipline distinct from psychology, but after the war, he was keen to build

bridges and published more than once in psychology journals. Thus, in tribal mourning rituals, what might look like the expression of individual emotion had a definite social component, and so did cases of death that were apparently due directly and solely to the victim's state of mind. His lecture on cooperation between the two disciplines mentioned topics such as language, symbolism, expectation, and rhythm (a long-standing interest). This line of thought led him to conceptualize *l'homme total*, man in his three aspects as organism, mind, and member of society.

Commentators often remark on the concrete nature of Mauss's thinking about social facts. Rather than drawing data from anywhere in his encyclopedic knowledge, he believed in critical assessment of sources and exact localization of facts in time and space. Geography and the environment mattered, as is clear when he discusses social morphology, for instance, in the *Manual*, or more specifically when studying the Eskimos. The rhythmic seasonal alternation between summer and winter lifestyles amounted almost to two distinct Inuit cultures. In the summer, the population dispersed in single-family tents, only to concentrate in multifamily houses or igloos in the winter stations. Religious activity, minimal in summer, was both facilitated and stimulated by the social density in winter. But Mauss also studied cultural geography on a larger scale. With Durkheim and later, he argued that sociology included intersocietal and international phenomena. Thus, he recognized a very ancient stratum of civilization covering the islands and shores of the Pacific, containing smaller regions related in part to language families.

Although Mauss usually maintained a gap between purely academic writing and the political engagement best exhibited in his critique of Bolshevism, his attitudes sometimes show through. The final section of *The Gift* is well-known, but he also (discreetly) favors colonial emancipation and moves toward global governance. He did not write on gender politics but lamented that the anthropology of his time covered only half of humanity.

Mauss's Legacy

For several reasons, notably World War II, Mauss did not leave behind a united group of Maussians. Many who heard or knew him found inspiration in the man, while those who can only read him have tended to emphasize or draw on just one or two aspects of his multifarious oeuvre. Thus, Lévi-Strauss saw him as the precursor of structuralism, and others, more recently, have seen him as the discoverer of "the symbolic," or of *l'homme total*. Many have embraced the political economy aspect of *The Gift*, in particular the group of French scholars led by Alain Caillé, who constitute the Mouvement Anti-Utilitariste dans les Sciences Sociales. Recent discussions of embodiment and habitus regularly look back to *Techniques of the Body*. In comparison, other aspects of his work have perhaps been relatively neglected. For instance, one approach to kinship takes from Mauss the observation that names and souls are often transmitted between alternate genealogical levels and connects it with his idea of exchanging children—thereby complementing Lévi-Strauss's use of Mauss's formulations about the exchange of women. It was probably from *Primitive Classification*, via the Sinologist Marcel Granet, that Georges Dumézil gained his "trifunctional" insights into Indo-European ideology—insights that continue to be developed in various ways by comparative mythologists.

It is recognized that after the First World War Mauss permitted himself a number of discreet criticisms of his uncle, for instance, of his binarism (as in sacred/profane or religion/magic) and of his conception of clans as internally amorphous. However, the earlier intellectual exchanges between the two men are difficult to reconstruct. Obviously, Durkheim taught his nephew, but the influences were not all one-way. From early on, Mauss could contribute insights from Indology, and the writings of his youth, notably those on sacrifice and on the rhythmic relation between social concentration and dispersal, contributed more than is usually recognized to Durkheim's *Elementary Forms of Religious Life*. In that sense, Durkheim himself can be numbered among those who learned from Mauss.

Naturally, in such a substantial oeuvre, passages can be found that have not stood the test of time. However, the depth and sharpness of Mauss's curiosity and the range of his knowledge remain exemplary, and if many of his ideas call for development beyond the point that he himself reached, this can be regarded less as a defect than as an invitation or stimulus.

McLennan, John

John Ferguson McLennan (1827–1881), a Scottish lawyer in Edinburgh, pioneered the comparative study of marriage and descent at a time when marriage was widely debated in British scholarly journals, in popular novels, and in the "penny dreadfuls" sold on London street corners. In 1865, when Charles Dickens's *Our Mutual Friend* explored the complexities of familial and financial life across classes in London, McLennan's *Primitive Marriage* argued for the evolutionary origins of marriage worldwide in the capture of brides. In 1869–1870, on the eve of Charles Darwin's *The Descent of Man and Selection in Relation to Sex* (1871) and George Eliot's *Middlemarch* (1871–1872), McLennan, in the influential *Fortnightly Review*, argued that human kinship evolved from the earliest form of religion, which he believed to be the worship of animals and plants as *totems* whom humans venerated as their ancestral kin. In contrast to Dickens, Darwin, and Eliot, McLennan is no longer a household name. Yet his influence on scholars of his time such as Edward Tylor and William Robertson Smith and, through Smith, on James G. Frazer, Émile Durkheim, and Sigmund Freud contributed to creating the fields of kinship, religion, and ecology in anthropology. Research in these fields has since disproved his theories of the social evolution of marriage and religion. Yet his accounts of contemporary practices of marriage and divorce in Great Britain are now recognized as valuable historical documents in the comparative study of kinship, marriage, and religion.

McLennan—born on October 14, 1827, in Inverness, Scotland—was the first of three sons of John McLennan, an insurance agent, and Jessie Ross. A gifted student, he went from the University of Aberdeen (MA, 1849) to the University of Cambridge, where he got a first-class rank in his mathematics exams in 1853, but he left for London without taking his degree. While studying law, he wrote for liberal journals like *The Leader*, founded by George Henry Lewes and Thornton Hunt; fellow contributors included George Eliot, Harriet Martineau, and Herbert Spencer. According to his friend William Michael Rossetti, he also wrote poetry, including *Poems on the Praeraphaelite Principle* (since lost). He returned to Scotland, where he joined the Scottish bar in 1857, serving in Edinburgh as secretary of the Scottish Society for Promoting the Amendment of the Law and in London as Parliamentary Draftsman for Scotland (1871–1875). He married Mary Bell McCulloch in 1862 and, after her death, Eleonora Anne Brandram in 1875. He died at Hayes Common, Kent, on June

16, 1881, at the age of 53, from long-standing tuberculosis complicated by malaria.

McLennan's career exemplifies how intellectuals interested in legal reform contributed to the study of human behavior from a comparative perspective, later called anthropology. His article "Law" for the *Encyclopaedia Britannica* in 1857 drew on Auguste Comte's *Cours de Philosophie Positive* (translated into English by Harriet Martineau in 1853) to argue for the study of society according to scientific principles. While still writing on popular culture (notably, a critique of *Scottish Art and Artists in 1860* under the name of "Iconoclast"), he wrote "Marriage and Divorce: The Law of England and Scotland" (*North British Review*, 1861), arguing that the "errors and defects" in these laws, more than in any others, inflicted the greatest suffering on human hearts. In "Hill Tribes in India" (*North British Review*, 1863), he followed this up by examining "the leading relationships of life," mainly marriage practices among people then subject to British colonial rule. Here, he began to conjecture about what he called "the progress of mankind," assuming, as was common then, that the current practices of colonized and colonizing people exemplified primitive and civilized stages in human development, respectively, and could therefore be used to make historical arguments.

Primitive Marriage (1865), which McLennan described as "an exercise in scientific history," is based on this assumption plus the notion that symbols are relics of past realities. McLennan put marriage reform at the heart of human history, coining the terms *endogamy* and *exogamy* (marriage within a specified group and marriage outside a specific group, respectively) in the process. Primordial promiscuous hordes, struggling over scarce resources, killed female infants less fit for hunting and warfare and therefore "prey[ed] upon one another for wives." As they progressed in civility, they developed kinship by descent through women (matriliny) combined with polyandry, then patriliny combined with polygamy, and, ultimately, at the highest stage, monogamy. In the *Fortnightly Review* in 1869–1870, McLennan cited Lewis Henry Morgan's research on the animal names of exogamous Iroquois tribes to argue that the "totem stage of development," in which humans worshipped the animal or plant (their *totem*) imagined to be their ancestral kin, breed, or species, represented the earliest stage in human history.

The debates over the relative antiquity of matriliny and patriliny between McLennan, Morgan, John Lubbock, and Henry Maine, taken up in Darwin's *Descent of Man*, provoked ethnographic and archival research that disproved their theories of social evolution while refining our understanding of marriage and descent past and present. McLennan's legal works are now a valuable source of data for analyzing the kinship practices of people in Great Britain and its colonies in terms of their differing social positions in the British Empire in the mid-19th century. By linking exogamy, matriliny, and the worship of animals and plants into one system he called "totemism," McLennan inspired the study of sacrifice. Smith, then Frazer, Durkheim, and Freud, showed how sacrifice, in which animals stand in for humans, works to forge social groups, a field of inquiry into the intimate relations of humans and other organic beings that now encompasses kinship, religion, political economy, and ecology.

Mead, George Herbert

George Herbert Mead (1863–1931) was an American philosopher and social scientist. He is considered among the most innovative thinkers in the philosophy of pragmatism and is best known as a founder of the discipline of social psychology, in particular symbolic interactionism. Among his most notable contributions include establishing the social and symbolic basis of mind and self, the relationship between language and culture, language use in social interaction as the means by which reality is constructed, and a metaphysics of emergence and temporality.

Mead was born on February 27, 1863, in South Hadley, Massachusetts. In 1870, the Mead family moved to Oberlin, Ohio, where his father, a Congregational minister, joined the faculty of the Oberlin Theological Seminary. His mother was on the faculty of Oberlin College and later served as president of Mount Holyoke College. Mead attended Oberlin College (1879–1883), earning a BA degree. At Oberlin, he was exposed to progressive ideas and was greatly influenced by those of Charles Darwin. During this time, he became a committed naturalist and a nonbeliever. After graduation, Mead tried teaching school; then, for 3 years, he worked on a surveying crew for the Wisconsin Central Railroad Company. In 1887, he entered graduate school at Harvard, where he studied psychology and philosophy.

After Harvard, Mead traveled to Germany (1888–1891) to continue his studies with Wilhelm Dilthey and in the psychology laboratory of Wilhelm Wundt. In 1891, Mead married Helen Castle, the sister of his friend Henry Castle, and joined the faculty of Philosophy and Psychology at the University of Michigan. A son, Henry, was born in 1892. In 1894, Mead joined John Dewey at the University of Chicago. At Chicago, Mead flourished as a teacher and a scholar. In addition to his academic career, he was involved in numerous progressive causes. He was a member of the civic-minded City Club of Chicago, he participated in educational reform initiatives, he supported women's suffrage, and he worked with Jane Addams in the Settlement Movement and Hull House. He stayed in Chicago until his death on April 26, 1931.

Pragmatism

Pragmatism is a philosophical school of thought founded in the United States around 1870. The central themes of pragmatism are consistent with science as a problem-solving method: with the study of phenomena as they occur in nature, and with the emergent, processual, and consequential qualities of the world. For pragmatists, ideas should be based on observation and put to an empirical test and judged by their usefulness, by their practical consequences. The process of finding ideas that work was called *intelligent practice*.

Four principles form the basis of pragmatism: (1) reality is based on language and is socially constructed; (2) people define and act toward social and cultural objects according to their meaning and practicality; (3) because of language use and symbolic behavior that is largely molded in human social environments, humans are fundamentally different from all other species; and, finally, (4) any understanding of human individual and social behavior, and social worlds must be based on observations of situated human behavior.

Mind, Language, and Reality

Mead understood that group life preceded the human mind and that language, mind, and self emerged together in the context of the social processes inherent in group life and cannot be understood apart from those processes. Mead defined mind, or mental processes, as thought—as internal conversations with oneself. In his treatment, mind evolved when vocal gestures (primitive language) gained significance, when those gestures called out in self a response that was functionally identical to the response called out in the other. Vocal gestures became symbolic and shared.

Mead, along with Franz Boas, Edward Sapir, and Benjamin Lee Whorf, were instrumental in identifying the relationship between language and culture and between language, thought, and constructed reality. Like the anthropological linguists, Mead characterized language as a set of significant symbols and rules of usage that are shared by members of

a speech community. As people in the community named and defined objects in their world, language developed, and reality became socially constructed, shared, and symbolic. Accordingly, perception and thought both were made possible and constrained by the structure of one's native language.

Regarding thought, experience, and mental activity, Mead noted that they only happen in the ongoing present. Past experiences, or memory, can only exist as experience in the present. Past experience isn't experienced as it was originally, but rather, it is reconstructed or re-membered in relation to the circumstances constituting a person's present situation. In Mead's view, reality is continually being reconstructed as a way of making sense of the present. As with the past, Mead characterized the future as existing only in the present as a projected outcome or a previsioned consequence of purposive action. From Mead's perspective, the past is not objective facticity and cannot determine human conduct. Instead, human behavior in the present is guided in part by a reconstructed past and conditioned by a projected future.

Mead observed a reflexive quality in mental activity, the ability to adjust one's behavior in anticipation of the incipient behavior of others. Through observation, a person takes the attitude of the other and prepares his or her own options for action that coordinates with, circumvents, or resists the oncoming actions of the other person in the situation. A teacher seeing an angry parent approaching adjusts how he or she will meet the parent. Similarly, by turning back experience on oneself, one can identify the attitude of others and adjust one's own behavior to affect how one is seen and defined by them.

For Mead, human behavior is not caused. Nor is it released or propelled by stimuli or by social forces. Human behavior is organized and directed toward practical consequences in the form of individual and social acts. A hungry person has several options to solve his problem. He can look for a café or a convenience store, go home to raid his refrigerator, or ignore the hunger. Once a course of action is selected, the person can proceed with the social act. The hunger does not determine the course of action taken. Mind works as the process of initiating purposive behavior.

Self, Society, and the Social Act

In Mead's view, the self arises within the context of social interaction in significant social relationships. Having a self involves how a person identifies self and acts in social situations. Self is largely a process that develops within dominant social relationships and is related to the language used in those relationships. That is, we come to know ourselves from the actions and responses of others, particularly significant others. We are not, however, totally determined by the definitions and actions of others. Mead insisted that humans are more than the product of their social environment; they are an active part of the social groups that define them. Our own actions affect how others define us. Inherent in the process of viewing ourselves from the perspective of others is the potential for changing self by changing how others view us. A child who perceives that others view her as lacking in intelligence can begin to take her studies seriously and improve her vocabulary and academic performance. Others may note this and redefine the child.

The nature of the social relationships in which a person's self develops forms a significant dimension of self. In this sense, self cannot exist without other/s. A person can organize and regulate his own activity, or it can be done by others. The demands and expectations of others are routinely taken into account in organizing our behavior. Mead's inclusion of the significant role of social relationships in the development of self has been adopted by postmodern anthropologists, who focus on how dominant groups not only oppress but also repress the full, healthy development of self. Not only does a subordinate learn to anticipate the expectations of her supervisor, but also a child born into a highly paternalistic society, including a strict paternalistic family structure, will have a different self as compared with a child who develops in a society that is characterized by egalitarian social forms. For Mead, the form of the social relationships in which a person is involved is a significant dimension of self.

For Mead, a person has a self when he can act toward himself as a social or cultural object, as others act toward him. Social objects have names, definitions, and understandings on how to act toward them. We learn the social objects that constitute our worlds through our involvement in social group life. A pencil is a social object, as is a church. Friday is a social object. We name social objects and act toward them in terms of how we define them. Similarly, people can be social objects. We define and act toward college professors differently than we define and act

toward a thief. We become a social object to ourselves when we make indications to self and direct our behavior with regard to the definition of our role in a social situation. When college professors prepare their next lecture, they are acting toward self as a social object.

Significant or meaningful interaction for Mead is constituted in a triadic process involving the initiating vocal gesture, the response of another, and the result of or consequence of the interaction. Thus, the meaning of an utterance is not contained in the words spoken or in the intent of the speaker. When a young woman smiles and says "Hi" to a young man who does not return the smile, it has an entirely different meaning as when the warm greeting is returned by the young man, who then stops to talk to the young lady and asks for her telephone number. The meaning of a smile does not lie in the utterance. It is contingent on the response of the other and any consequence thereof.

Mead describes the development of self as occurring in three distinct stages of increasing complexity in language use: (1) thought processes, (2) role-taking ability, and (3) organizing one's own behavior. These stages encompass early learning, play, and games. In the game stage, the child begins to engage in reciprocal interaction by taking the role of the other in social situations.

As children learn more complex games, they come to understand an organized set of roles as it relates to their own behavior. They abide by rules, act strategically, and act with others in an organized fashion, including a division of labor, toward a common future state. For example, in a baseball game, a player understands the organized set of roles that constitute his team in the game and can anticipate their behavior in a given situation. The kinds of games played by boys and girls in a society prepare them for their involvements as adults. For example, boys who play football are preparing for their involvement in corporate worlds. They are learning hierarchically organized, competitive, coordinated action involving a division of labor and a leader who defines and initiates a sequence of social acts that lead to a specific outcome.

An implied final stage in Mead's development of self is the "generalized other." It refers to the perspective that is common to the group or community to which a person belongs. That is, the person sees self from the generalized standpoint of the larger community. A person defined as a nice guy by his community, besides seeing himself as a nice guy, is morally obliged to act like a nice guy throughout the day or risk being held accountable for untoward behavior. For Mead, the generalized other accounts for consistent behavior across situations involving different actors.

In Mead's view, all group life is based on the cooperative (coordinated) behavior of its members. Coordinated social behavior or social acts begin with an impulse and end with an achieved objective that releases the impulse. For Mead, the social act is the basic unit of analysis in the study of human social behavior. A social act may involve the participation of two or more people and can range from the simple (two people in conversation) to the complex (a government agency investigating corruption). Short-term social acts can be embedded in long-term social acts. For example, a group project is part of the social act of getting a college education.

Social acts are both observable and understandable to social scientists and competent members of society who engage in them daily. Mead's idea was to develop a way to understand the methods that people employ both to construct social acts and to make sense of it all. In their vast variety and number, social acts constitute what we think of as culture and society. It is in social acts that social and cultural objects are defined and acted on. It is through social acts that people construct, maintain, and modify reality.

Mead, Margaret

Margaret Mead (1901–1978) was an American cultural anthropologist best known for her ethnographic research on small-scale cultures in the South Pacific and her role as a public intellectual. She made anthropology and anthropological concepts such as cultural relativism and gender known to the general public through her many books, lectures, magazine articles, and radio and television appearances. A student of Franz Boas and Ruth Benedict, Mead had a strong background in psychology, an interest shared by both of her mentors. Her major contributions to 20th-century anthropology include highlighting the importance of the study of women and children in anthropological research, the integration of methods and theories from psychology with anthropological theory and research, bringing out the importance of fieldwork as a hallmark of anthropology, and the development of the subfields of applied anthropology and visual anthropology. The latter included an emphasis on the importance of film and photography in both fieldwork and data analysis. Mead was not only a major contributor to the subfield of psychological anthropology known as culture and personality, she was also influential in introducing the notion of culture into the study of psychology and psychoanalysis. A strong proponent of cultural relativism, Mead has been both lauded and maligned for her conviction that each culture needs to be understood and evaluated based on its own beliefs, practices, and cultural logic rather than the values and beliefs of Western culture.

By the time of her death in 1978, Mead had become internationally famous as an outspoken and articulate public intellectual, using her anthropological insights to speak out on issues that ranged from parenting and sexuality to atomic energy and the environment. President Jimmy Carter posthumously awarded Mead the United States Medal of Freedom. However, in 1983, 4 years after her death, the Australian anthropologist Derek Freeman challenged Mead's findings published in her first book, *Coming of Age in Samoa* (1928). He argued in favor of biological determinism and against what he argued was Mead's extreme position of cultural determinism as the sole factor influencing human behavior. Given Mead's status as a public intellectual in late-20th-century America, Freeman's accusations grabbed the media's attention, and American anthropologists rallied to support Mead, seeing Freeman's critique of her Samoan research as flawed in itself.

Background and Early Years

Mead was born in Philadelphia, Pennsylvania, the eldest of five children, to Edward Mead, a professor of finance at the University of Pennsylvania, and Emily (Fogg) Mead, a graduate of Wellesley College and the University of Chicago, where she studied sociology with Thorstein Veblen. As a child, Mead accompanied her mother while she conducted research on Italian immigrants for her doctoral dissertation. Unlike her parents, both of whom were nonreligious, as a child, Mead decided to join the Episcopal Church, remaining a practicing member throughout her life. Growing up in an unconventional academic family—her mother was a feminist, and Mead was homeschooled by her grandmother until high school—Mead was determined, in opposition to her father's desires, to go to college. Transferring after her freshman year from DePauw University to Barnard College, part of Columbia University in New York City, she studied psychology and English literature. After completing her undergraduate degree in 1923, she received a master's degree in social psychology for her thesis *Intelligence Tests of Italian and American Children* (1925). The results of her research, a comparative study of IQ testing among "American" children and the children of Italian immigrants (Mead utilized her experience with her mother's fieldwork), demonstrated that there was a cultural bias to the tests that affected adversely the immigrant students' scores. This research contributed to her lifelong interest in the interrelationship between culture—or one's social environment—and individual psychology—or one's biological "nature"—as well as the topic of race and its relationship to human nature versus nurture. However, after taking graduate courses with the anthropologists Franz Boas and Ruth Benedict,

Mead decided to pursue a PhD in anthropology rather than social psychology as Benedict had convinced her that there was an urgency to anthropological research as the opportunity to work with what were then called "primitive cultures" was quickly being lost.

In 1923, Mead married Luther Cressman, a theology student and a neighbor of her family's in Doylestown, Pennsylvania. Cressman, a doctoral candidate in sociology at Columbia University during Mead's fieldwork in Samoa, agreed to a divorce after Mead met the New Zealand anthropologist Reo Fortune while returning from her fieldwork in the Pacific. Mead's marriage to Fortune lasted from 1928 to 1935, when she met the British anthropologist Gregory Bateson while she and Fortune were doing fieldwork in New Guinea. Bateson and Mead were married from 1936 to 1950 and had one child, a daughter, Mary Catherine Bateson, who became a linguistic anthropologist.

Although Mead never openly acknowledged having had a sexual relationship with her mentor Ruth Benedict, Benedict self-identified as a lesbian and Mead's daughter, in her 1984 memoir about her parents, implied that Mead and Benedict had been lovers. Later in her career, Mead, in an article for the women's magazine *Redbook* in 1975, suggested that an individual's sexual identity was malleable and could change over the course of one's life from early youthful infatuations with the same sex, to heterosexual relations during adulthood (specifically, during a woman's fertile, childbearing years), to homosexual attachments during old age. Indeed, Mead seems to have followed this pattern herself, living until her death with the anthropologist Rhoda Metraux.

Mead's Theoretical Contributions to Anthropology

Coming of Age in Samoa (1928): *Nature Versus Nurture*

As was typical at the time, Mead wrote a doctoral dissertation based on extensive library research and then prepared to go off to do fieldwork. Her thesis advisor, the founder and chair of the Department of Anthropology at Columbia University, Franz Boas, suggested that she do research in American Samoa as it was a relatively safe place for a young woman on her own. The research topic that Boas gave her to investigate was the emotions and behavior of adolescent Samoan girls as they entered young adulthood. A petite 24-year-old woman (she was 5 feet 2 inches) at the time, she was ideally suited physically to work with adolescent girls, many of whom were already taller and bigger than she was. The issue of adolescent development was of interest to Boas because he disagreed with the then prevailing theory of adolescent psychological development propounded by the American psychologist G. Stanley Hall. Influenced by Sigmund Freud and evolutionary theory, Hall believed that adolescence was necessarily a time of tension and stress for all youth because of the biological transitions they were experiencing during puberty. Boas was interested in challenging this strictly biological determinist theory as he hypothesized that environmental factors, such as the culture in which one grew up, might also play a role in how adolescence was experienced. The case of adolescent Samoan girls would provide an excellent test case for his hypothesis concerning the role of cultural and social factors in shaping individual psychology and behavior.

Mead's research demonstrated that adolescence in Samoa engendered a very different psychological experience for Samoan girls than adolescence in America, evoking none of the emotional turmoil and intergenerational strife prevalent among adolescents in the United States, thus providing Boas with the one negative case he needed to contradict Hall's theory based solely on biological determinism. Moreover, as Nancy Lutkehaus points out in her 2008 book *Margaret Mead: The Making of an American Icon*, Mead's book *Coming of Age in Samoa*, written for a popular readership, catapulted her into national recognition. The American public was eager to understand its own younger generation, the products of the Jazz Age, so different from their parents. Mead's Samoan research represents one of the earliest ethnographic contributions to what is often glossed over by scientists as "biological determinism versus cultural determinism" or "nature versus nurture," a debate that continues today as researchers seek to understand the complex relationship between biological and cultural factors as they shape human behavior.

Growing Up in New Guinea (1931)

Continuing her interest in the relationship between individual psychological development and

culture, Mead's next research focused on children in New Guinea. Guided by the idea then favored by psychologists that the minds of children, primitive people, and psychotics were similar, Mead wanted to understand the characteristics of the minds of children in primitive cultures and how they changed as they became adults. In 1933, she went to the Manus Islands with her second husband, Reo Fortune. In *Growing Up in New Guinea*, Mead argued that Manus children had to be taught "primitive" beliefs such as the importance of ghosts and ancestor spirits, beliefs that dominated the lives and behavior of their parents. In other words, from the standpoint of Western psychological theory, Manus children were more "rational" than their parents, and to become "normal" Manus adults, they had to become socialized into their "superstitions."

The Changing Culture of an Indian Tribe *(1932): Acculturation Studies*

During the summer of 1930, Mead and Fortune conducted research among the Omaha, a displaced Native American tribe in Nebraska. Mead found the research depressing, as she acutely felt the Omaha experiencing the unraveling of their traditional culture. However, her focus on the Omaha's adaptation to their newly settled, semi-urban way of life, which she described in her book *The Changing Culture of an Indian Tribe*, has subsequently been cited as one of the earliest examples of the anthropological study of acculturation. In a later study of culture change, based on her return to Manus 25 years after her first visit there, Mead observed a more positive response of the formerly tribal society to the impact of Western culture. Her analysis of what she saw as the successful acculturation of the Manus, published in her book *New Lives for Old* (1954), was an early theoretical contribution to the newly developing subfield of applied anthropology.

Sex and Temperament in Three Primitive Societies (1935)

Mead's research among the Mundugumor, Tshambuli (Chambri), and Mountain Arapesh of New Guinea, undertaken with Reo Fortune, was less controversial than her Samoan research. *Although Sex and Temperament in Three Primitive Societies* has also received its share of criticism (see below), it may be more far-reaching in its impact. This research is often cited by feminists as the source of the distinction between "gender"—as an identity and an associated set of beliefs and behavior—and "sex"—as a biological categorization of an individual based on anatomical characteristics. In her book, Mead observed that each of the three different New Guinea tribes she and Fortune studied had a different cultural norm for typical male and female behavior. Among the Arapesh, both men and women were expected to be maternal, conciliatory, and nurturing of children. Among the belligerent Mundugumor, the norm was for both men and women to be aggressive and to lack an interest in child care. However, in Tchambuli society, it was the women who were the economic providers, while the men stayed at home to care for the children and spent hours preparing elaborate headdresses and attire for their ritual dances.

The implications that Mead drew from these cultural differences was that male and female behavior was not "hardwired" as part of our biological heritage but instead was malleable and could be influenced by the culture one grew up in.

This important insight—another contribution to the role of culture versus biology in the determination of human behavior—brought her acclaim from both scholars and the general public.

Balinese Character *(1942): A New Visual Methodology*

After her marriage to Gregory Bateson in 1936, Mead's research turned to data gathering with film and still photography. Mead and Bateson's fieldwork in Bali, which they undertook in 1936, did not make lasting theoretical contributions. They had hoped not only to use moving and still photography to demonstrate the ways in which culture shapes both emotions and their bodily expression but also to provide new insights into the study of schizophrenia. While their research contributed nothing new to the study of mental illness, it did demonstrate the importance of visual data to the study of culture and behavior. Their photographic study *Balinese Character* (1942) and the films they shot during this fieldwork, such as "*Trance and Dance in Bali*," are acknowledged as important methodological contributions to anthropological research. They helped establish the subfield of visual anthropology, championing the production of ethnographic film and the

use of film and still photography for the microanalysis of behavior.

"Culture-and-Personality" School

Mead's research in Samoa, New Guinea, and Bali demonstrated her interest in the study of the human mind and the impact of culture on individual emotions, beliefs, and behavior. Along with her mentor Ruth Benedict, she was influential in creating the Culture-and-Personality school, a precursor of the subfield of psychological anthropology. Other anthropologists associated with culture and personality studies include A. Irving Hallowell, John and Beatrice Whiting, Cora DuBois, Clyde Kluckhohn, and, to a lesser extent, Gregory Bateson. Mead was greatly influenced by Benedict's book *Patterns of Culture* (1934), which argued for an understanding of culture as "personality writ large." Like Benedict, who claimed that a culture and an individual were both more or less consistent patterns of thought and action, Mead also promoted a configurationist approach to the analysis of cultures, looking for patterns in behavior, beliefs, social institutions, and so on, that combine to form a distinct culture. These traits constitute an interdependent constellation of aesthetics and values in each culture that together add up to a unique gestalt. Today, the name "culture and personality," along with some of its basic theories and premises, such as "modal personality," "cultural configuration," and culture as "personality writ large," has become outdated. However, other aspects of culture and personality studies, such as the focus on understanding the individual within the context of his or her culture, the interaction between the individual and culture, and culture's impact on an individual's emotion, remain fundamental concerns of psychological anthropology.

Mead's Legacy: The Mead-Freeman Controversy

When Freeman published his critique of Mead's Samoan research in 1984, many anthropologists felt that some of the basic theoretical principles of American cultural anthropology, such as the importance of culture in the determination of behavior, were being attacked. Moreover, they cited many ethnographic errors and misrepresentations in Freeman's arguments against Mead, ultimately leading the American Anthropological Association to condemn Freeman's critique. However, because of Mead's public celebrity status, both her reputation and that of cultural anthropology suffered as a result of the media's coverage of the controversy. At present, although anthropologists such as Ira Bashkow and Lise Dobrin, Deborah Gewertz and Paul Roscoe are aware of and have written about the shortcomings of Mead's research, such as her findings about the Arapesh and Chambri in *Sex and Temperament in Three Primitive Societies*, many of these same individuals, including Gewertz, Richard Handler, Maureen Molloy, and Roscoe, praise other aspects of her work and her pioneering contributions to ethnographic research methodology, the study of kinship, gender and child rearing, and psychological anthropology. Although Mead's legacy outside anthropology is mixed, her contributions to anthropology are many, and she remains a pioneering figure in the application of anthropological insights to issues fundamental to modern American life, such as race, gender, sexuality, children, and the family.

Meillassoux, Claude

Claude Meillassoux (1925–2005), born in northern France, exerted a major influence in anthropology through his work on West African farm communities, slavery, premodern trade, gender roles, and the theory of imperialism.

In the 1950s, after participating in militant Third World study groups, he was initiated to Anglo-Saxon social anthropology by Georges Balandier and conducted fieldwork among Gouro-speaking farmers in Côte d'Ivoire. Subsequently, he spent his career in the French National Research Center and carried out longer stretches of fieldwork among the Soninke and Marka populations in Mali and Senegal. In the 1960s, he came to be known as a pioneer of Marxist anthropology and an economic anthropologist, but he also wrote on Mande culture history, voluntary associations, comparative kinship, child labor, and apartheid South Africa.

In his first pathbreaking article of 1960, Meillassoux presented a model of farm communities producing most of their needs (self-provisioning), based on his Gouro fieldwork. The model assumes that all members have access to land, and tools are simple and easy to find; the division of labor follows sex and age. Even so, production techniques are complex and necessitate a long apprenticeship. Senior men at the top of the hierarchy act as the organizers. Younger men work the farms and produce most other necessities but "yield" the produce to the elders, who then distribute it according to norms and needs. This dependency finds expression in kinship and corresponds to filial relations within the household; therefore, it is consensual but also fraught with potential antagonism. Senior men's authority stems ultimately from their control of knowledge and also the farming conditions: Until harvest time, previous years' stored crops are needed for sustenance; older men appear as the providers, setting the principle of anteriority supreme. Yet the resulting social ranking is not simply inscribed in the natural order. The elders reinforce their hold by limiting the transmission of the requisite knowledge through cultural means or extending its range beyond the technical to ritual and the supernatural, to delay or constrain the emancipation of junior men. Furthermore, they control junior men's social progress by regulating marriage, because young men can only obtain dependents and set off in the path of autonomy by establishing their proper household.

Senior elders provide spouses for young men by engaging in delayed exchanges with other groups, in which the surrender of bride wealth goods, an assortment of diverse rare objects, serves as a safeguard for later reciprocation. The elders keep these treasures out of reach of the juniors. When the development of monetary relations threatens their easier availability, they resist the conversion of bride wealth to money. The broader powers they gain with their ability to control marriages allows them to delegate local tasks such as the distribution of food to younger seniors heading house groups. This complex political organization that rests on farming can evolve into stratified village polities. The worsening of general security, the rise of militarized groups, or invasion by foreigners can further lead to centralized power. More frequently, these communities trade with foreign professionals. Usually, the senior elders monopolize trade, isolating the rest of the community from the exchanges. If their control collapses, the young men and women sell their products directly, price equivalencies emerge within the community, and the entire social order starts changing.

Meillassoux ethnography of the Gouro, published in 1964 and based on a survey of four villages; the intensive study of published sources; and the ingenious use of aerial mapping, put greater emphasis on farmers as cash croppers. In 1975, in a theoretical synthesis translated as *Maidens, Meal and Money*, he elaborated that women were valued more for giving birth than as agricultural workers;

if there was subjugation, it lasted only during their procreative years, primarily to control the offspring. The book also considered wage work in colonial situations and internal migration. The workers who travel to take up mining or factory jobs are raised in farm communities, which also reabsorb them when they return worn out, making it possible for the industries that employ them to pay lower wages. This explains the paradox that imperialist systems deliberately maintain labor reserves and community areas, instead of fully integrating them into the capitalist system.

Meillassoux's originality lay in focusing on farm production and theorizing family and community in terms of "relations of production," a Marxist inspiration. His bride wealth analysis revealed that restrictions on the circulation of objects had political consequences, laying bare the triteness of earlier discussions on bride purchase; his contrast between juniors and seniors opened up new interpretive horizons. Meillassoux sways in his early writings between describing self-provisioning farm communities as a step in historical evolution and as fieldwork reality, but his 1975 book settled on the latter perspective. Meillassoux provided an impetus for a lively debate in the 1970s known as the "modes of production controversy" (the term having been given currency by the philosopher Louis Althusser), but he responded by avoiding its use.

Between 1960 and 1977, in his Senegal and Mali fieldwork, Meillassoux encountered complex, stratified savanna societies, and his writing took a historic turn. *The Development of Indigenous Trade and Markets in West Africa* synthesized 19th-century travel literature and earlier 20th-century ethnologists' and historians' contributions to produce an intricate canvas of connections between production and commerce in West Africa. He distinguished long-distance commerce in high-value items from women's retail food trade. Until the 20th century, this commerce surpassed the Atlantic trade in volume. War provided a means of payment and markets for this trade. Commerce involved, however, only products, not labor or capital; as prices across the region remained uncoordinated, trade profits had no systematic influence on production conditions. A major discovery of the book was slavery's significance in several 19th-century savanna societies, as in many others elsewhere in the world since antiquity. While slavery assumed different forms, across regions and local cultures, slaves served as a major commodity and were employed to produce food and goods supplied to long-distance trade. These insights were pursued in his edited *Slavery in Precolonial Africa* (1975), which was the first major discussion of African slavery by anthropologists, and developed in *The Anthropology of Slavery: The Womb of Iron and Gold*.

Meillassoux noted that because slaves were captured from the outside, their work was less costly to the capturers than internally raising the equivalent population. This way, resources got transferred from birth communities to those of forcible incorporation. But the captured needed to be moved far away in order to reduce their chances of being delivered or escaping, giving rise to extensive trade networks. The use of slaves in agriculture, war, tax collection, and government subsidized the military establishment of enslavement. In contrast to full members of the community, the exploitation of slaves in agrarian conditions absorbed their life energies, hampering their self-reproduction. They were replenished only by ongoing capture. A slave society could not be self-contained—a significant amendment of Marx and Engels and of the earlier Marxist tradition, which considered slavery a type of society, or "mode of production." But the demand for slaves was bound to exceed the demographic capacity of the pilfered population to supply them, extending the catchment area to exhaustion. If in successive generations slaves were transformed into serflike communities paying a product-rent, exploitation was subdued. Commerce allowed some West African areas to increase the number of dependents through purchase, generating profits and feeding the monetized long-distance trade economy, as well as the overseas Mediterranean and Atlantic markets.

This comprehensive theory revealed the shortcomings of earlier studies on slavery based on information from 19th-century America, because the banning of the transatlantic slave trade by then had altered the circumstances. Meillassoux's analysis of slavery is one of the greatest anthropological contributions to general social theory.

Meillassoux's later publications focused on child labor, emphasizing its wage-lowering effect at the expense of adults staggering under high

unemployment rates. His final book, *Mythes et Limites de l'Anthropologie* (Myths and Limits of Anthropology, 2001), argued that the naturalist model of kinship emerged in warrior-aristocratic cultures, where power holders sought to limit succession to persons in their household whom they could dominate personally.

In economic anthropology, Meillassoux was influenced by Karl Polanyi and Paul Bohannan, but his sweeping vision linking political and economic phenomena and his ability to recognize broad patterns that eluded others, both partly inspired by his Marxian focus on social reproduction, led him quickly to leave behind their typological approach to produce strikingly original contributions.

Mintz, Sidney

Sidney W. Mintz (1922–) is an American anthropologist known for his pioneering ethnographic and historical research on the Caribbean, Afro-American cultures, cultural creolization, and food systems. Mintz is the author and editor of several books and many scientific articles on these and related themes. Caribbeanist anthropologists typically study only one society or societies speaking the same language in the region. Mintz chose to do fieldwork in three Caribbean societies with three different colonial legacies and languages: Puerto Rico (1948–1949, 1953, 1956), Jamaica (1952, 1954), and Haiti (1958–1959, 1961). He later worked in Iran (1966–1967), where he did fieldwork with his wife, Jacqueline Wei Mintz, and in Hong Kong (1996, 1999).

Biography and Theoretical Directions

Mintz was born in Dover, New Jersey, one of four children of Eastern European Jewish immigrant parents. Arriving in New York at the beginning of the 20th century, his father, Solomon, was a diemaker and clothing salesman; his mother, Fanny, became a seamstress and Industrial Workers of the World organizer. With the onset of the Depression, Solomon lost the restaurant he had eventually come to own there, opened a diner, and became a cook. Mintz attended Brooklyn College, and in the summer months, he worked the midnight shift at an arsenal near Dover. After receiving his BA in psychology in 1943, he was drafted into the U.S. Army Air Corps, where he taught celestial navigation. After the war and with the aid of the G.I. Bill, he enrolled in graduate studies in the Department of Anthropology at Columbia University in September 1946. During 1947–1948, he was an assistant to Ruth Benedict, whom he admired. At Columbia, he encountered fellow veteran graduate students who were interested in leftist/radical politics and in applying Marxist/materialist approaches to anthropological theory. They formed a study group called the Mundial Upheaval Society, many of whose members, including Mintz, Stanley Diamond, Morton Fried, Robert Manners, John Murra, Elman Service, and Eric Wolf, became prominent professionally.

At Columbia, a major influence was Julian Steward, whose models of multilinear evolution provided a critique of the ethnographic particularism of many followers of Franz Boas and a counterpart to Benedict's culture and personality approach. With funding from the Rockefeller Foundation and the University of Puerto Rico, Steward assembled a team of graduate students from Columbia and from the University of Chicago, whose members

would each study an economically and ecologically distinct sector in the island. Mintz chose to study a rural sugar plantation proletariat at "Cañamelar," a pseudonym for Jauca, Santa Isabel, on the island's south coast. Murra, who was on the faculty of the University of Puerto Rico, was the project's field manager. In the resulting landmark book, *The People of Puerto Rico: A Study in Social Anthropology* (1956), each student contributed a chapter based on his or her field studies. It was during his fieldwork that Mintz developed a lifelong friendship with his main informant, Anastacio Zayas Alvarado ("Taso"), who became the subject of Mintz's book *Worker in the Cane: A Puerto Rican Life History* (1960).

Mintz's early anthropological training contributed greatly to the formation of his theoretical perspective. Mintz agreed with his friend and early collaborator Wolf that past cultural forms and social structures orient and limit human behavior; but within these forms, and from the norms acquired as part of the culture-learning process, humans learn how to maneuver socially toward achieving their particular goals. Their room for maneuver, however, depends substantially on their position within specific social and economic systems. Mintz sought to create a theory of culture that might enrich Marxism. For Mintz, "culture," while definable as behavior mediated through symbols, must also be seen as a set of historically derived materials animated by events and actors in a social system. Placing an emphasis on how people made their living and how that experience is objectified and symbolized, Mintz argues that cultural forms and social positions overlap. Different classes and social groupings do not necessarily have different cultures; yet the existence of some single, coherent culture for each society cannot be demonstrated. From early on, Mintz developed his characteristic refusal to consider the "communities" studied by anthropologists as cut off from wider networks and historical connections of world power and influence. Here, he anticipated the anthropological interest in globalization by decades.

Other early influences on the formation of Mintz's anthropological thought include his encounters with the work of Caribbean intellectuals. While doing fieldwork in Puerto Rico, he met the Trinidadian historian (later politician) Eric Williams and read his now classic book *Capitalism and Slavery* (1944), in which Williams argued that the motivations for slavery were economic and that Atlantic slavery was implicated in the development of capitalism. Mintz was also influenced by the Trotskyite Trinidadian scholar-writer C. L. R. James's book *The Black Jacobins: Toussaint Louverture and the San Domingo Revolution* (1938), which he read when preparing to do research in Haiti. In his book, James argued for the utter modernity of Caribbean people, born as they were in the crucible of slavery and industrial factory production that characterized the sugar plantations. Mintz also interacted with Caribbean ethnologists such as Fernando Ortiz of Cuba and Jean Price-Mars of Haiti. Other Caribbean intellectual influences can be traced to the Haitian anthropologist Rémy Bastien, the Jamaican anthropologist Jean Besson, the Jamaican historian Douglas Hall, and the Guyanese historian Elsa Goveia, among others.

Mintz conducted fieldwork in Jamaica's former "Free Villages," whose origins could be traced to church-founded landholding schemes to establish a free peasantry after slave emancipation during the 1830s and 1840s. This led to his interest in the Caribbean peasantry. Early research on peasant markets and on market women in Jamaica led to a Guggenheim Fellowship to conduct research on Haitian markets. Mintz published papers on units of measure, on trading partners, on the uses of capital, and on the specifics of provisioning and financial transactions. He would later reflect on his fieldwork and his relationships with his informants in Puerto Rico, Jamaica, and Haiti in his book *Three Ancient Colonies: Caribbean Themes and Variations*, published in 2010.

Mintz enjoyed a long academic career at Yale University (1951–1974), where he helped found the Afro-American Studies program. He produced PhD students who did their dissertations on the Caribbean, including the African American scholar Councill S. Taylor. In 1974, he was invited to found the Department of Anthropology at the Johns Hopkins University, where he helped start the interdisciplinary Program in Atlantic History and Culture. There, he produced a number of PhD graduates, including many from the Caribbean, who were all encouraged to study a Caribbean society different from their own. He was the editor of a book series on the Caribbean for the Yale University Press, and

then, after his move to Johns Hopkins University, he became a coeditor of the Johns Hopkins Studies in Atlantic History and Culture book series. He was a visiting professor at the Massachusetts Institute of Technology, the École Pratique des Hautes Études and the Collège de France (Paris), Florida International University, the Chinese University of Hong Kong, and elsewhere. In 1992, Johns Hopkins established the annual Sidney W. Mintz Lecture, which quickly became a prestigious venue. In 2012, the American Anthropological Association awarded Mintz the Franz Boas Award for Exemplary Service to Anthropology.

Critical Contributions to Anthropology

Mintz's critical contributions are many; in the context of a career spanning 5 decades, they are difficult to adumbrate. They fall roughly into three broad categories: (1) a historical approach to the formation of Caribbean societies, their role in the emergence of the capitalist world system, and how local responses would affect the cultural outcomes; (2) what is meant by the creolization of African culture in the New World; and (3) the historical anthropology of food, food systems, and foodways.

Capitalism, Contradictions, and the Caribbean

Mintz often pointed out that the Caribbean was the site of Europe's first sustained transoceanic colonial expansion and that this intercultural encounter was conducted on terms new to both the dominators and the dominated. In *Caribbean Transformations* (1974), Mintz theorized that colonial and postcolonial Caribbean "plantation societies" were deeply affected by the plantation complex, because it was itself tied to wider, world-spanning political economies and its populations of slaves and masters began as migrants themselves. Mintz's materialistic approach led him to suspect popular-nationalist and scholarly arguments that differing colonial slavery systems produced qualitatively differing degrees of cruelty, exploitation, and racism. The intensity of capitalistic effort did affect how these societies and cultures took shape. Mintz further argued that conventional theoretical categories had to be rethought when it came to the Caribbean. For example, in debating whether the Caribbean slave could be considered a proletarian, Mintz pointed out that Caribbean slavery was different from most Old World slavery because of its involvement with capitalism. But because slavery meant unfree labor, the Caribbean region was, while in the service of capitalism, not fully capitalistic. Contradictory forces, he argued, produced Caribbean peoples who were highly individualized through their plantation-based relationship with modernity yet able to engage in collective and cooperative activity. Caribbean peasantries were unlike the peasantries that existed elsewhere. They were formed, he contended, in resistance and as an adaptation to slavery and the plantation complex, as a "mode of response" to the plantation system and a "mode of resistance" to superior power. Mintz called them "reconstituted" because they began in recent historical time as something other than peasants. Not content with typological overviews, Mintz focused his ethnographic lens on the domestic economy and the gendered division of labor, especially women's roles in marketing.

Creolization in Question

In collaboration with the anthropologist Richard Price, Mintz's one-time informal student and then colleague at Yale and at Johns Hopkins, Mintz addressed the question of African cultural origins and cultural creativity in the New World. In the book *The Birth of African-American Culture: An Anthropological Approach* (1992; first published in 1976 and first delivered as a conference paper in 1973), Mintz and Price considered the question of *creolization* (a term used to describe the blending of two or more cultural traditions to create a new one) in Afro-American culture. Though they do not employ the word *creolization* at all in the book, they significantly revise and qualify the U.S. anthropologist Melville J. Herskovits's approach to Afro-American culture, which Herskovits saw as consisting of African cultural survivals existing below the surface of colonial-derived culture but still identifiable in key practices such as language and religion. Mintz and Price looked instead at cultural creativity and mutual fashioning in hierarchical, power-laden colonial and postcolonial contexts. Combining Herskovits's cultural-anthropological approach and the structuralism of the anthropologist Claude Lévi-Strauss (Price had studied with Lévi-Strauss for a year in Paris), Mintz and Price argued that Afro-American culture is characterized

by the deep-level "grammatical principles" of the various African cultures that entered into the slave trade and that these principles today extend to motor behaviors, kinship practices, gender relations, and religious cosmologies. This has been an influential yet controversial model in the anthropology of the African diaspora.

Sweetness, Power, and Gastronomical Orbits

Sweetness and Power: The Place of Sugar in Modern History (1985) established Mintz's prominence as an anthropologist of food. Drawing on history, anthropology, botany, geography, economics, and nutrition, *Sweetness and Power* employs multidisciplinary theory and methodology to explore sugar's meanings and uses over time. The book is also notable for incorporating issues of both production and consumption and for connecting the New World brutalities of slavery in the Caribbean to the Old World brutalities of English industrialization. While those who produced sugar endured cruelty, slavery, and early death, the product of that labor was consumed in weak tea and in bread and jam in Britain by the world's first factory proletarians. Among the first serious academic studies to feature an edible commodity, *Sweetness and Power* became a model of interdisciplinary food studies scholarship.

In *Tasting Food, Tasting Freedom: Excursions Into Eating, Culture, and the Past* (1996), Mintz evinced skepticism about the existence of "national" (especially "American") cuisines, and argued instead that cuisines are products of regional geographical locations and indigenous foods. Later, Mintz traced the development and use of the "proletarian hunger killers" tea and Coca-Cola, which emerged as popular drinks in modernizing societies (England of the 1800s, the southern United States of the 1900s) as workers' mealtimes became shaped by factory schedules. Finally, Mintz examined the use of soy in the West, primarily as an industrial crop rather than as a human food, in contrast to soy's multiple forms in Asian foodways.

Mintz's Legacy

Mintz combined a Marxist/historical materialist perspective with the particularism of Boasian cultural anthropology. His focus remained steadily on those global socioeconomic forces that marked the advent of capitalism and European expansion in the Caribbean. But at the same time Mintz argued that the local cultural responses to such forces should be investigated through careful, empathetic, and ethical ethnography; Mintz's theoretical approach anticipated the interest in globalization and cultural hybridity that characterized early-21-century anthropology. Yet Mintz insisted, against the grain, that these concepts used only in the abstract were of no help to serious anthropological and historical understanding. Methodologically, Mintz's historical approach led the way for anthropologists to visit the archives. And *multisited ethnography* was part of his anthropology well before the term was coined. Mintz was also reflexive on academic politics. He regretted that the study of the Caribbean was placed outside anthropology's prestige zones because its culturally and ethnically hybrid populations were not "exotic" enough for a discipline that sometimes traded in exoticism. His own immense contribution to anthropological theory based on Caribbean research belied those mistaken and prejudiced notions. Mintz's leading role in the production, reproduction, and institutionalization of anthropological knowledge means that his legacy will endure.

Mobility

Mobility—a complex assemblage of movement, representation, and practice—appears self-evidently central to globalization, as a key process and as a fundamental metaphor capturing the common impression that our lifeworld is in constant flux. The current anthropological interest in human mobility, from daily home-to-work movements to more permanent transnational migration, goes hand in hand with theoretical approaches that question earlier taken-for-granted correspondences between peoples, places, and cultures. This follows the critique by James Clifford in the 1990s that anthropology needs to leave behind its preoccupation with discovering the "roots" of sociocultural forms and instead trace the "routes" that (re)produce them. Over the years, anthropologists have studied the most diverse forms of mobility across the globe. This entry examines key issues related to the concept of mobility that have repercussions for the discipline as a whole.

Although anthropologists have been slow to react to the alleged "mobility turn" in the social sciences (as propagated by geographers and sociologists), ideas of mobility have a long history in anthropology. They are already present in transcultural diffusionism (Franz Boas) and in French theories of gift exchange systems (Marcel Mauss). Archaeological and (ethno)historical records show that humankind has always been characterized by movement and that certain groups were more mobile in the past than they are now. For a long time, however, mainstream anthropology mostly confined its analyses of boundary-crossing movements to the areas of kinship (marriage mobility), politics (structure of nomadic peoples), and religion (pilgrimage). Moreover, mobility was often limited as a defining characteristic of groups such as hunter-gatherers or traveler gypsies. It was used as a concept describing physical or abstract motion, not as something implying in and of itself social or cultural change.

While classical anthropology tended to ignore or regard boundary-crossing movements as deviations from normative place-bound communities, cultural homogeneity, and social integration, discourses of globalization and cosmopolitanism (which have become dominant since the end of the Cold War) shifted the pendulum in the opposite direction. In the 1990s, globalization—largely theorized in terms of transborder "flows"—was often being promoted as normality, and too much place attachment was seen as a local resistance against globalizing forces. Mobility became a predominant characteristic of anthropological analyses of the globalized world. This led to "multi-sited ethnography" (George Marcus), to capture the transnational flows that "deterritorialize identity" (Arjun Appadurai) and lead to "creolization" (Ulf Hannerz). By the turn of the millennium, however, there were already serious cracks in the discourse of unfettered mobility that accompanied the master narrative of the benefits and necessity of (economic) globalization. The overly optimistic language of mobility had inadvertently distracted attention from how the fluidity of markets shapes flexibility in modes of control (see the work of Anna Tsing and Aihwa Ong).

The movement of people may, and often does, create or reinforce difference and inequality, as well as blending or erasing such differences (Nina Glick Schiller). Despite the overly general celebration and romanticization, the ability to move (and the freedom not to move) is spread unevenly within countries and across the planet. Border-crossing journeys as a form of human experience are the exception rather than the norm. Anthropologists were among the first to point out that the very processes that produce cross-border movements and global linkages also promote immobility, exclusion, and

disconnection (see the work of Hilary Cunningham, Josiah Heyman, and James Ferguson). Stated differently, mobility and immobility always go together. The boundaries people face in mobility are related to factors such as social class, gender, age, lifestyle, ethnicity, nationality, and disability (all of which have been addressed by anthropological research in some way or the other).

Geographical mobility is made meaningful by being linked with the accumulation of economic (material resources), social (relational networks), or cultural (the embodied dispositions and competencies of cosmopolitanism) capital (Pierre Bourdieu). Although there often is a contradiction between this dominant ideology of mobility and the barriers faced in trying to realize it, mobilities and boundaries are not antithetical. Physical borders, for instance, have themselves been historically mobile, and as they move, people's previous daily connections suddenly become cross-border mobility. The first stages of the Industrial Revolution were marked by states trying to contain their labor within their borders. As more people began to move, states attempted to maintain authority over the sociocultural meaning that is attributed to these movements (Pál Nyíri). Consideration of the interconnectedness of mobilities and moorings focuses research on the political-economic processes by which people are bounded, emplaced, and allowed or forced to move. Such a focus shows how mobility is materially grounded (Johan Lindquist). To assess the extent or nature of movement, or, indeed, even observe it sometimes, one needs to spend a lot of time studying the things that stand still (or change at a much slower pace).

Mobility research directs new questions toward traditional anthropological topics. Many earlier conceptualizations blinded scholars to the fact that mobility is variable and multidimensional. People are moving all the time, but not all movements are equally meaningful and life shaping (for both those who move and those who stay put). Mobility gains meaning through its embeddedness within societies, culture, politics, and histories (which are themselves, to a certain extent, mobile). Alongside gender, class, race, ethnicity, age, nationality, language, religion, lifestyle, disability, and geopolitical groupings, mobility has become a key difference- and otherness-producing machine, involving significant inequalities of speed, risk, rights, and status, with both mobile and immobile people being engaged in the construction of complex politics of location and movement.

The critical questions for an anthropology of (im)mobility are not so much about the overall rise or decline of mobility but about how various mobilities are formed, regulated, and distributed across the globe and how the formation, regulation, and distribution of these mobilities are shaped and patterned by existing social, political, and economic structures. The cultural assumptions, meanings, and values attached to (im)mobility need to be empirically problematized rather than assumed. Contemporary anthropology is well equipped to challenge the (Western) assumptions embedded within many interdisciplinary mobility studies. Founding fathers such as Franz Boas and Bronisław Malinowski, while missing the extent to which their own epistemological projects were predicated on their own mobility, showed how the liminal positioning of anthropologists among the humanities and social sciences, with constant methodological and theoretical boundary crossings, offers promise for a fruitful holistic and grounded ethnographic analysis of the various forms of human mobility.

Modernism

Modernism can generally be defined as a broad movement or set of movements, primarily though

not exclusively in the arts, that, responding to cultural, material, and political changes in the Western world, engendered new forms of cultural and artistic expression in Europe and America in the late 19th and early 20th centuries. On the whole, modernist attitudes were those of revolt from traditional, Enlightenment (and, more recently, in Anglo-American contexts, "Victorian") ways of viewing the world and expressing it through the arts, perhaps most pithily expressed in the poet Ezra Pound's dictum "Make it new!" World War I is generally viewed as the historical event that most profoundly gave rise to (or confirmed) disillusionment in the modern world order and in the orthodox and received ways of knowing that characterize modernist expression.

Modernist Currents in the Arts and Anthropology

Perhaps most saliently, modernism is characterized by the rejection of realism as an ideology and method and a predominance of skepticism and pessimism in philosophical outlook and in tone. Formally, modernism in the arts tends to promote and illustrate discontinuous (vs. continuous or consecutive) narrative form and innovation in modes of expression that promote subjective (rather than objective) states: specific movements and methods embodying those include, variously, stream of consciousness narrative, collage, spatialism, surrealism, cubism, Dadaism, expressionism, imagism, and primitivism. Artists considered most characteristically and prominently "modernist" include Igor Stravinsky, Pablo Picasso, James Joyce, Joseph Conrad, Max Ernst, T. S. Eliot, Ezra Pound, William Butler Yeats, Virginia Woolf, William Faulkner, Ernest Hemingway, and Langston Hughes.

If taken strictly in terms of periodization, modernist anthropology could be considered the social and cultural anthropology produced in roughly the first half of the 20th century, and as such it would coincide with the period in which anthropology as a field became institutionalized in universities and in departments of anthropology. This is, of course, also the time frame in which, in Anglo-American anthropology especially, the monograph became established as the normative discursive form of social and cultural anthropology and participant observation became the normative practice or methodology. Considered in terms of this time frame and the rise of these institutionalizing practices, the most prominent "modernist" anthropologists would include Franz Boas and Bronisław Malinowski in England and America and Marcel Mauss in France (acknowledging that the institutionalization of anthropology in France followed some trajectories quite different from those on the Anglo-American scene).

Given that modernism is generally defined as an *artistic* period or movement (or constellation of movements), it is worth considering how the rise and prevalence of modernism in the arts influenced or was related to the anthropology of that period. It is certainly the case that a number of anthropologists in the first decades of the 20th century in England and America either were practicing artists or styled themselves as such—note Malinowski's famous injunction in his notorious Diary, "I shall be the Conrad" of cultural anthropology, and also Ruth Benedict and Edward Sapir's avocation as poets. However, the interpenetration of modernist aesthetics with modern anthropology was considerably more pronounced within French anthropology, especially in the case of the Collège de Sociologie, wherein Georges Bataille, Roger Caillois, Michel Leiris, and others collectively engaged in what James Clifford has termed an "ethnographic surrealism" that was vitally related to the avant-garde aesthetic experimentation in Europe in the early decades of the century. As Clifford and Michele Richman note, the Collège's modernist aspects were hardly limited to literary styles or effects, but rather, the work, individually and collectively, of members of the Collège was vitally concerned with the role of myth and the sacred in collective life, issues that were also, arguably, central to much of modernist art. In the case of the Collège, what can be defined as "modernist" has less to do with the influence (of, say, modernist art on modernist anthropology) and more to do with a mutual interpenetration of prevalent modernist concerns and modes of expression: One could say that both artist and anthropologist, and artist *as* anthropologist, were vitally concerned with how to wrest individual and collective value and meaning out of the chaos and fragmentation of modern living.

On the Anglo-American scene, on the other hand, both the creators of modernist literature and subsequent critics and readers of modernist art emphasized the importance of the influence of anthropology on the arts, and on modernist literature in particular.

The most famous of those anthropological influences was that of James G. Frazer's *The Golden Bough* on modernist masterworks such as Eliot's poem *The Waste Land* and Joyce's novel *Ulysses*, both published in 1922. Eliot advertised his debt to Frazer both in the controversial "Notes" he appended to *The Waste Land* and in a very visible and highly quoted review (1923) he wrote of *Ulysses*, in which, Eliot noted, Joyce, with the aid of Frazer and others, had created a "mythical method" for modern art that would supplant the more traditional "narrative method" of creating literature that could make sense of modern life.

The modernist preoccupation (sometimes rising to obsession) with *The Golden Bough* and related evolutionary-oriented anthropological writings both greatly influenced and was a manifestation of a broad cultural and artistic fascination with the primitive and with ritual, which preoccupied and galvanized much of modernist art—both the visual arts (Picasso, Georges Braque, etc.) and the literary arts (Yeats, Eliot, Eugene O'Neill, and D. H. Lawrence, to name but a few). Theories of myth and ritual so prevalent in the late 19th and early 20th centuries in evolutionary anthropology had a great influence on modernist artists, by their own admission, having impacts on both formal and thematic aspects of their works. Such theories came from Frazer, certainly, but also from a wide range of anthropologists and classicists, perhaps most notably and influentially, on the Anglo-American scene, the Cambridge Hellenists or Ritualists, including Jane Harrison and F. M. Cornford, who asserted, often drawing from the archaeology of the period, a ritualist origin and basis for all art, ancient and modern. These theories came to have a great influence not only on modernist art but also on 20th-century theories of art, including, perhaps most prominently, the so-called myth criticism of the mid-20th century (see, e.g., the work of Joseph Campbell and Stanley Edgar Hyman) and arguably culminating in Northrop Frye's landmark work of literary criticism, *Anatomy of Criticism* (1957).

Ironically, the literary works that most famously made the case for a modernist literature, *The Waste Land* and *Ulysses*, and were pronounced by Eliot as vitally influenced by Frazer's work, were published in the same year, 1922, in which Malinowski's *Argonauts of the Western Pacific* appeared, which more than any other single anthropological work changed the landscape of modern cultural anthropology. At the same moment that Eliot was making the case for the enormous influence of Frazer's brand of comparative evolutionism on modernist art, Malinowski's *Argonauts* was marking, and making, the shift away from evolutionism to functionalism in theory, as well as away from comparative organization and discourse to what would become the orthodox form of ethnography for decades to come: the monograph.

Now, of course, Malinowski was not the only or even the first anthropologist to put forward alternatives to evolutionary theory and to the comparative method. As early as the 1880s, Boas in America was arguing against the then prevalent evolutionary assumptions as those influenced, and organized, the comparative arrangement of artifacts in anthropological museums. However, not until Malinowski's *Argonauts* was there an ethnography that provided a model for the monograph, which would become the orthodox discursive form in cultural anthropology through much of the 20th century. Whereas the Frazerian comparative text provided the predominant anthropological inspiration for artistic modernism, especially in its freewheeling juxtapositions of ancient and modern, of "primitive" and "civilized," and of magic and religion and science, within cultural anthropology itself, the modernist form par excellence was the monograph, which, in its mode of participant observation and its discursive casting of the ethnographer as narrator-hero, provided a much more narrative-based (vs. comparative based) discursive form. Just as artistic modernism (at least as articulated by Eliot) was moving from the conventional narrative method to the "mythical method," modernism in anthropology was signified by a movement from the "mythical" and comparative methods of evolutionary anthropology to the more predominantly narrative method of the monograph, with its accounting of the experience in time of the ethnographer as hero.

A fundamental change occurring in anthropology in the late 19th and early 20th centuries was the shift from a predominantly evolutionary view of culture hierarchically conceived (represented by a ladder, with "primitive culture" on the bottom rung and civilized British culture on the top rung) to a conception of "cultures," which in the plural are conceived as not higher or lower but as distinct from one another—thus, cultural relativism was born. This dramatic shift, from hierarchically

conceived culture to relativistically regarded cultures, is witnessed in the decline in influence within anthropology of evolutionary anthropologists such as Frazer and Tylor (whose 1871 volume *Primitive Culture* is commonly seen as inaugurating cultural anthropology as a field) and the rise of resolutely nonevolutionary, field-based anthropologists such as Boas and his disciples in America (Robert Lowie, Margaret Mead, Sapir, Benedict, etc.) and Malinowski, E. E. Evans-Pritchard, A. R. Radcliffe-Brown, and others in England.

Cultural relativism as it emerged in the modern, or modernist, anthropology that dominated the anthropological scene for several decades (from roughly the early 1920s through the 1940s or later) was but one of a number of relativisms emerging out of the modern era that marked, or characterized, modernist thought and expression. In this regard, cultural relativism can be seen, in a very general sense, as one of a piece with Einstein's theory of relativity or the psychoanalytic theories of Freud, both of which sought to knock off balance received notions of cosmic or psychic stability, respectively, much as cultural relativism in anthropology sought to knock off balance received notions of cultural order.

Postmodernism

Finally, an understanding of modernism generally, or within anthropology more specifically, cannot be complete without some consideration of postmodernism, as a consequent movement (or cluster of movements) of philosophical or artistic tendencies in the past century. There have been numerous definitions and debates within the academy over the meaning of postmodernism and its relation to modernism, which in part have been concerned about whether postmodernism is a period ("post") following a modernist period and/or whether it is a set of attitudes and strategies that are located in or arise out of modernism (and modernity generally).

Acknowledging the above debates and complications, postmodernist anthropology generally can be defined as a period of anthropology following the canonical modernist anthropology of the first half of the 20th century and characterized by the embrace of, or in any case response to, various movements within the intellectual academy of the second half of the century, including structuralism (as articulated by Claude Lévi-Strauss most prominently), poststructuralism, semiotic anthropology (à la Clifford Geertz and others), feminist anthropology, and postcolonialist anthropology.

Somewhat more specifically, and in accord with the prevailing (and sometimes contesting) definitions and characteristics of postmodernism both within the academy and in contemporary culture generally—for example, postmodernism's sense of reflexivity and play, its loss of faith in organic form, its skepticism or even hyperawareness of representational practices, its skepticism or even hyperawareness of its own ties to imperialism and colonialism—postmodernist anthropology is often defined by and associated with the somewhat vaguely termed "ethnography as text movement." That movement was inaugurated by James Clifford and George Marcus's influential collection *Writing Culture* (1986), which was followed by the similarly influential *Women Writing Culture* (Ruth Behar & Deborah Gordon, 1995), which incorporated a feminist framework and a set of methodologies into the former collection's proclivities toward the textual/discursive and imperial/colonial nature of anthropology. These and other writings in the past several decades have themselves provided the opportunity and impetus to revisit, reassess, and redefine not only the future of cultural anthropology but also modernism as a general cultural movement and as a period or set of tendencies within cultural anthropology.

Montesquieu, Comte de

Charles-Louis de Secondat, Comte de Montesquieu (1689–1755), was one of the leading thinkers of the French Enlightenment. His literary career began with the publication of *Persian Letters* in 1721, a novel comprising letters written by and to a pair of Persian travelers in France. The book ranges from a witty satire of French manners to philosophical reflections about society and a vehement condemnation of despotism as embodied by the harem. In 1748, toward the end of his life, he published *The Spirit of Laws*, a treatise relating the principles of different forms of government to climate, geography, commerce, warfare, family, and religion in Europe as well as the non-European world. The comparative scope of Montesquieu's enterprise, if not his specific ideas, constituted a point of departure for social and political thought in France and Britain throughout the rest of the 18th century, providing a paradigm for universal schemes that, a century later, underpinned the emergence of modern anthropology.

Montesquieu was born into the judicial aristocracy in Bordeaux. He trained in law before inheriting his title along with the office of president of the Parlement of Bordeaux. The success of *Persian Letters* granted him notoriety and entry into the salons of Paris. Tired of the provincial atmosphere of Bordeaux, he sold his judicial office to finance his life in Paris as a successful writer and man of the world. His background in the law was clearly central in the elaboration of his life's major undertaking, *The Spirit of Laws*.

Persian Letters reverses the logic of the standard travel narrative by furnishing an account of French society, ostensibly from the point of view of non-European foreigners. Montesquieu cleverly stages the progressive initiation of the Persians Usbek and Rica into French society as naive incomprehension gives way to familiarity. The book self-consciously adopts a stance that would become central to much of ethnographic writing, the notion that outsiders are able to perceive fundamental aspects of society that insiders take for granted and fail to notice. The literary trope of the seemingly clueless but perceptive and insightful non-European outsider was hardly Montesquieu's invention, though the popularity of the book directly spawned a host of imitations.

The book shifts from a gentle satire of French society to a virulent critique of the domestic despotism of the Persian harem. Usbek, even tempered and philosophical in France, turns out to be a petty tyrant at home, subjecting his wives to the cruel discipline of eunuchs. In his absence, pandemonium breaks out, and his favorite wife, caught by the eunuchs with her lover, commits suicide—a dark ending to a broadly witty and entertaining book. The harem here functions as a metaphor for despotic rule in general, a focus of much of Montesquieu's later work.

The Spirit of Laws is a sprawling treatise of encyclopedic proportions. Its central contention is that "[laws] should be so specific to the people for whom they are devised that it is a great coincidence if those of one nation are suitable for any other." Montesquieu contended that the laws of any nation depended on its climate, geography, modes of livelihood, demography, commerce, religion, mores, and manners. Such a flagrant assertion of legal relativism flew in the face of the major currents of political theory, the deductive reasoning of Thomas Hobbes, John Locke, Hugo Grotius, and Samuel Pufendorf. In fact, such an ambitious comparative program had already been formulated by French jurists and historians in the 16th century but had later fallen into abeyance. Montesquieu was directly responsible for reviving and revamping such a project, one that underpins the logic of anthropology in particular and the social sciences in general.

Admittedly, Montesquieu's book does not always live up to such lofty aims. Montesquieu reduced the variety of legal systems to three: republican, monarchical, and despotic. Monarchies and despotisms were ruled by a single person, as opposed to republics; republics and monarchies were, unlike despotisms, subject to the all-encompassing rule of law. Each system was, he argued, governed by an entirely different principle. Republics depended on civic virtue, on the commitment of every citizen to uphold civic order and the law. Such virtue was entirely out of place in a monarchy, where subjects were most concerned with honor, the prerogatives associated with their rank, defending them not only against those beneath them but also especially against the monarch's central authority. Despotism, finally, was ruled by fear, by the need to cater to the ruler's irrational whims.

Montesquieu's assertions that each system was valid in and of itself, and that he was making no moral judgments, were not convincing. Clearly, despotic authority was his bugaboo, and his central political preoccupation was to elaborate the most effective checks against the arbitrary exercise of central authority. In this respect, his book was egregiously Eurocentric. Basing himself on Aristotle's adaptation of the Hippocratic scheme of climactic determinism in terms of hot, temperate, and cold climates, he asserted that Europe was the only region of the world that had developed alternatives to despotism, either republican or monarchical. He drew particularly on descriptions of Asian societies, notably Turkey, Persia, India, and China, as exemplars of despotic rule. In the absence of republican government, it was the existence of an independent aristocracy, however vainglorious, in Europe that constituted an effective barrier to arbitrary central authority.

Whatever the failings of Montesquieu's particular arguments, which were amply contested throughout the rest of the 18th century, the very scope of his project sketched out the epistemological foundations of modern anthropology.

Morgan, Lewis Henry

Lewis Henry Morgan (1818–1881), American ethnologist, lawyer, statesman, industrialist, and philanthropist, is among the founders of American anthropology.

Biography and Major Works

Morgan was born in Scipio, in western New York. One of 13 children, he was the son of a prosperous landowner and state senator. Educated in Latin

and Greek at Aurora Academy, Morgan pursued a law degree at Union College, where he became convinced of the virtues of progress, the power of rationality, and the truth of natural law. Admitted to the bar in 1842, he returned to Aurora but found little work. He gave lectures promoting temperance, wrote articles about history, and joined a fraternal club called the Order of the Gordian Knot.

Morgan and other members of the society determined to base the structure of the Gordian Knot and its rituals on those of the Iroquois. They changed their group's name to The Grand Order of the Iroquois and began to visit local Iroquois communities to learn their customs. They were aided by Ely Parker, the son of a chief of the Tonawanda band of the Seneca Nation, whom Morgan had met by chance at a local book shop. Parker also became prominent in his own right. Educated at a Baptist mission school and later at Rensselaer Polytechnic, Parker served on the staff of U. S. Grant during the Civil War and later as U.S. commissioner of Indian affairs.

In 1844, Morgan moved to Rochester, opened a law practice, and founded a branch of the Grand Order there. Within a few years, other branches had been established, and the society had more than 500 members. These constituted a web of connections that Morgan used to promote his legal practice. The purpose of the Grand Order included providing aid to Native Americans, and this involved Morgan in a largely unsuccessful legal battle to preserve Senecan land rights.

Although the Grand Order had dissolved by 1847, Morgan's interest in the Iroquois continued. Attempting to understand them, Morgan drew on his relationship with Parker and with the American ethnographer Henry Schoolcraft. He made numerous visits to Iroquois reservations in the late 1840s. In 1846, at Morgan's request, he and two friends were adopted into the Tonawanda band. Although this action was controversial among the Tonawanda, it gave Morgan additional access to information about them. Morgan's research resulted in the publication of *The League of the Iroquois* in 1851. There, Morgan traced the history of the Iroquois confederacy and detailed their environment, social institutions, and material culture.

In 1851, Morgan married his cousin Mary Elizabeth Steele, the daughter of a powerful Albany politician and bank director. Morgan's Rochester law practice grew, as did his involvement in civic affairs. In 1854, he founded the Pundit Club, an organization of intellectuals devoted to scientific exploration and discussion. Among its members was the Reverend Joshua H. McIlvaine, who was to have a profound influence on Morgan's thought.

Morgan was not religious in a doctrinaire sense; however, he was affected by the deep religious beliefs of his wife and of McIlvaine. His convictions included a commitment to monogenesis: the belief in the single origin and unity of all humans. Morgan was influenced by his reading of Darwin and came to believe in both deep time and change over time. However, Morgan remained convinced of the independent origin of each species. McIlvaine's disapproval of marriage to close relatives might have also played a role in Morgan's kinship studies.

In the mid-1850s, Morgan became the chief lawyer for investors in railway and mining operations in Michigan's Upper Peninsula. He prospered from both the legal fees he collected and the investments he made in both railways and mines. These included one-fourth ownership of the Lewis Morgan Iron Company. He traveled frequently to Michigan for his clients and to oversee his properties. Morgan's wealth allowed him the freedom to pursue his ethnological interests and amass a substantial library.

Although he continued to be involved in the wide-ranging intellectual activities of the Pundit Club, Morgan did not pursue his interest in ethnography until after he attended the 1857 meeting of the American Association for the Advancement of Science. In a paper describing Iroquois kinship the following year, Morgan noted that a comparison of descent systems might prove the Asiatic origins of Native Americans. At the same time, McIlvaine drew Morgan's attention to comparative philology, and Morgan began to consider the relationship between kinship and language. This led to the publication in 1871 of *Systems of Consanguinity and Affinity of the Human Family*, in which Morgan analyzed kin terminology from cultures throughout the world and proposed an evolutionary framework for kinship.

As he researched kinship and language, Morgan also wrote *The American Beaver and His Works* (1868), an in-depth biological study of the beaver that also argued for the similarity of mental processes in humans and animals, as well as the socially driven evolution of human and animal mental

capacity. Morgan proposed that the beaver's works emerged from its social relationships.

In 1870 and 1871, Morgan traveled for 14 months in Europe, spending time with Darwin, John F. McLennan, John Lubbock, and Thomas H. Huxley. These meetings, and particularly the writings of McLennan and Lubbock as well contributions from McIlvaine, Lorimer Fison, and Adolf Bandelier, were influential in the writing of *Ancient Society* (1877). There, Morgan traced the progress of human society, focusing on inventions and subsistence, and the evolution of the ideas of government, the family, and property. He thus combined his work on kinship with analysis of other social institutions.

In the summer of 1878, Morgan traveled to Colorado and New Mexico. His experiences led to the publication in 1881 of *Houses and House Life of the American Aborigines*. Morgan hoped to show that all Native American architecture reflected a primitive family structure and communal property ownership.

In addition to his research in anthropology, Morgan was deeply involved in civic and organizational life. He was elected to the state assembly as a Republican in 1861 and served one term. In 1867, he was elected to the state senate and again served a single term, much of it taken up with disputes between the New York Central and Erie Railroads. He sought, but did not attain, positions as commissioner of Indian affairs and U.S. ambassador. In 1875, he founded the anthropology subsection of the American Association for the Advancement of Science and, in 1880, served as president of the association. He was elected to the National Academy of Sciences in 1875. Morgan had also long been interested in the education of women. He was instrumental in the founding of Wells College (originally a women's college, today coeducational) and was its first elected trustee.

Morgan and his wife had three children. His two daughters died of scarlet fever in 1862 while Morgan was traveling on the Missouri River. His son was born with a mental deficiency that prevented him from living independently. When Morgan died in 1881, he left his property to his wife and son during their lives but instructed that after their deaths, his considerable estate pass to the University of Rochester to promote the education of women. The university also received the bulk of his library as well as most of his papers.

Critical Contributions to Anthropology

Morgan's contributions to anthropology were wide-ranging and seminal. They can be divided into three broad, interrelated categories: (1) work in ethnography, (2) kinship studies, and (3) social evolution.

Ethnographic Work on the Iroquois

Morgan's early work, *The League of the Iroquois*, set a precedent for American ethnography. Although European Americans had written about Native Americans during the 17th and 18th centuries, most of the accounts were written from the perspective of conquerors and missionaries. Many were harsh critiques of native society, purporting to explain the conditions of natives as the result of their fall from grace or their innate savagery. Although Morgan's work was romantic and condescending, it was relatively free of overt value judgment, focusing instead on descriptions of social and political institutions. Unlike much previous work, *The League of the Iroquois* was based on direct data collection, both through interviews with Ely Parker and through time spent at the Iroquois reservations. Morgan presented his work "To encourage a kinder feeling toward the Indian . . ." and argued that left to their own devices the Iroquois would make progress toward civilization.

Kinship and Evolution

In his research for *The League of the Iroquois*, Morgan had noted the differences between Iroquois and European understandings of kinship. In the late 1850s, he turned his attention more directly to the analysis of kin systems. Morgan began to wonder if by combining the study of kinship with philology he could provide evidence for the unity of all Native Americans and shed light on their origins. As with *The League of the Iroquois*, Morgan turned to empirical research. With the support of the Smithsonian Institution, he devised a questionnaire to collect information on kinship, testing it among the Iroquois. He sent questionnaires to contacts throughout the world and undertook yearly data-collecting trips to Kansas and Nebraska from 1859 to 1862. The linguistic data from these trips and surveys became the source of *Systems of Consanguinity and Affinity of the Human Family* (1871), in which Morgan showed that all societies used a small number of kinship systems and that

these could be described with reference to a small number of variables. One of the principal insights of *Systems* is the distinction between descriptive and classificatory kinship. In descriptive kin systems, specific terms such as *father* or *uncle* represent people who hold specific genealogical positions. In classificatory kin systems, a kin term can refer to a large number of genealogical positions. For example, in a classificatory kinship system, the term *father* may refer to all the men in your lineage who are of a generation older than you.

Morgan identified classificatory kin terminology among Native American groups and in data from India. He proposed that classificatory kinship systems originated in an earlier evolutionary stage when people were so promiscuous that it was impossible to distinguish among relatives. Thus, if a group of people were called "father" it was because the actual biological relationship to these individuals could not be known. He argued that different systems of kinship could be explained as stages of an orderly progression from this state of general promiscuity to the monogamous family of Morgan's day. Thus, evolution was a moral as well as a historical process. Morgan also proposed that the evolution of the family was tightly connected to changes in other social institutions, particularly the development of private property.

In Morgan's time, ethnology based on historical reconstruction frequently relied on biblical examples as well as data drawn from the ancient classical world. These were widely believed to be the oldest societies known. Morgan's idea that kinship terminology reflected evolution from an era of total promiscuity meant that the kinship terminology of the Bible and the classical world already showed substantial evolutionary change. It thus involved accepting the idea of human societies being far older than religious authorities countenanced. This idea forms a cornerstone of Morgan's next work, *Ancient Society*, the preface of which begins as follows: "The great antiquity of mankind upon the earth has been conclusively established."

Stages of Societal Evolution

After *Systems*, Morgan continued his work on social evolution, and in 1871, after his return from Europe, he began work on what became his most famous book, *Ancient Society: Or, Researches in the Lines of Human Progress From Savagery Through Barbarism to Civilization* (1877). Although *Ancient Society* contains some discussion of kin terminology, Morgan's primary focus was on kin organization, especially clans, which he called *gens*. More than half of *Ancient Society* is devoted to a discussion of the roles they play in the evolution of political organization. He also devotes substantial sections of the work to the evolution of the family and the development of the idea of private property, particularly as it relates to rules of inheritance.

In *Ancient Society*, Morgan proposed that the evolution of society involved the growth and development of institutions such as monogamous marriage, the nuclear family, and the concept of private property. Morgan associated developments in these areas with the stages of savagery, barbarism, and civilization. He further divided the first two of these into lower, middle, and upper stages. Using examples drawn from his surveys as well as studies of the Aztec and the ancient classical world, Morgan developed a system of classification that allowed him to place each society in a specific category. For example, people in the stage of middle savagery had developed technology for making fire, subsistence that included fishing, a "consanguine" family structure (founded on the intermarriage of brothers and sisters), and no concept of private property. Morgan indicates that Polynesians and Australian Aborigines were in the state of middle savagery at the time they were first contacted by the Europeans. Morgan's evolutionary scheme was very similar to the understanding of social evolution Edward Burnett Tylor presented in *Primitive Culture* in 1871. Morgan was aware of Tylor's work and had hoped to meet him during his travels in Europe in 1870–1871. However, the meeting never took place.

Morgan believed that the basic ideas that would lead to modern notions of the family, political institutions, and other aspects of society were present in incipient form in all human brains, even those of the lowest savages. He referred to these as "germs of thought." The evolution of society involved the expansion and growth of these germs, and this resulted in the development of complex social institutions. Morgan proposed a relationship between diet and the growth of "germs of thought" and thus linked subsistence and evolutionary progress. Great periods of evolutionary progress were related to the development of different forms of subsistence. Thus, in Morgan's scheme, savage society was based on

fishing and the gathering of wild vegetable foods, while the domestication of plants and animals was the basis for the evolutionary advance into barbarism. He proposed, for example, that the absence of animals adapted for domestication in the Americas was the reason for the backwardness of the aboriginal people of the Americas and that it was the domestication of large animals in the Old World, and the use of those animals to pull plows, that led to unlimited subsistence through agriculture and laid the foundation for civilization.

Morgan argued that because all of humanity had a single origin and because all humans shared the same basic cognitive makeup, the pathway of evolution was the same for all societies. Thus, ethnographers could examine each society, and by comparing its traits with those of other societies, they could determine not only its position on the evolutionary scale but also what earlier states of the society looked like and what the future would bring if the society were allowed to develop free of outside influence. Twentieth-century anthropologists called the comparison of traits among societies with the goal of locating their place in an evolutionary hierarchy the *comparative method* and referred to this understanding of social evolution as *unilineal evolutionism*.

For Morgan, the evolution of societies was determined by many interrelated factors, but the primary of these were biological and mental. Morgan was deeply influenced by the profound racism of his era, and he paid particular attention to the work of the physician Samuel G. Morton, who claimed to prove that different races were characterized by different brain sizes. Morgan believed that civilized people had larger brains than others. Thus, the process of social evolution had a biological basis. Evolution resulted in increased brain size, and this was assumed to correlate with increasing abilities to use logic and rationality. Increased rationality led to changes in technology and society. Although Morgan identified the relationships between technology, social institutions, and evolution, he understood these changes more as the result of evolution than its cause.

Morgan's Legacy

In his era, Morgan's work was central to the development of anthropology. John Wesley Powell, Frederick Ward Putnam, and Otis T. Mason all developed personal relationships with Morgan, and their work was strongly influenced by his. Powell, as first director of the Bureau of American Ethnography, made sure his staff members brought copies of *Ancient Society* to the field. Karl Marx and Friedrich Engels were drawn to the connections Morgan had identified between stages of cultural progress and material factors such as subsistence and technology. Marx made extensive notes to Morgan's work, and Engels later incorporated these into *The Origins of the Family, Private Property and the State* (1884). In the late 19th and early 20th centuries, Morgan exerted a profound though negative influence on Franz Boas and his followers. The Boasians attacked Morgan's evolutionism and drew attention to problems with his assumptions and techniques of cultural comparison. Their anthropology grew in direct opposition to Morgan's. In the 1930s and 1940s, Leslie White and others were drawn back to Morgan's analysis of the linkages between subsistence, technology, and other aspects of society. White argued that his own ideas about cultural evolution were firmly rooted in Morgan's. Although there is much scholarship about Morgan today, few anthropologists engage the specifics of his work. Nevertheless, his insights about kinship and his ideas about subsistence, technology, and progress continue to exert an influence on the field.

Müller, Max

Friedrich Max Müller (1823–1900) was a German scholar, celebrated in his day, who relocated to England in 1846 and spent the rest of his life there, mainly at Oxford University. He was renowned in multiple fields: Indology, comparative philology, comparative religion, and comparative mythology. He was, above all, a leading Sanskritist. To introduce the sacred writings of the East to the West, he oversaw the editing of the 49-volume *Sacred Books of the East*.

Müller was educated in his native Germany and then studied for a few years in Paris. His talent for languages was exceptional. While in Paris, he was urged to undertake a translation of the most ancient of the Vedas, the Rig Veda. He devoted much of his life to the publication of a critical edition. The manuscripts that he needed were available only in England—they were owned by the East India Company—and that is why he moved there. In 1854, he was named Taylorian Professor of Modern European Languages at Oxford. In 1858, he became a fellow of All Souls College. In 1860, he lost the election, to a lesser scholar but a more conservative Christian, for Oxford's chair in Sanskrit. Müller remained bitter for life at the decision but vowed to continue with his research and never left England. In 1868, he was named the first occupant of Oxford's chair of comparative philology. He delivered the most prestigious lecture series in the land, among them the Gifford Lectures, and was what today would be called a public intellectual.

Müller was a leading Indo-Europeanist and espoused Sanskrit as the original Indo-European language. For him, as for many others, language was the key to culture. Conventionally, he pitted Indo-European, or Aryan, language and culture against Semitic language and culture. But to his credit, he did not, like so many others, extend culture to race, and he was appalled at the extension. He defended the superiority of the dark-skinned Indians to the white-skinned Scandinavians. He was a relentless advocate of Indian civilization. He sought to show the kinship among Indo-European peoples. Yet he remained a staunch Christian, specifically a Lutheran, and somehow managed to reconcile the superiority of Christianity with a common source for all Indo-European religions.

The "Science of Religion"

Müller was the founder of the "science of religion," which became identical with the field of religious studies. By *science*, he did not mean an experimental discipline like physics or chemistry. He meant "science" in the ancient, Aristotelian sense of a unified body of knowledge. What for him made religious studies scientific was threefold: (1) a distinctive subject matter, (2) a purportedly distinctive method of studying that subject matter, and (3) the attribution of religion to other than revelation. More recent defenders of the autonomy of the discipline such as Mircea Eliade echo Müller.

According to this school, which came to call itself the history of religion, religion originates and functions to bring believers close to God. No other origin or function is allowed. If the sole way to explain religion is religiously, then only those in the field of religious studies are qualified to study religion. Anthropologists, sociologists, economists, and psychologists, all of whom explain religion nonreligiously, are excluded. Religious studies are thereby entitled to the status of an independent discipline, one safe from competition with the social sciences. The autonomy of the discipline does not rest on the assumption of the truth of religion. Like the social sciences, the science of religion circumvents the issue of truth and limits itself to the issues of origin and function. It is on the origin and function, not the truth, of religion that this discipline breaks with the social sciences.

Although Müller was a Christian, his theory of religion was more typical of Pagan or pantheistic nature mythology, according to which religion, which goes hand in hand with mythology, is the worship of one natural phenomenon or another. For Müller, as for some nature mythologists, that phenomenon was the sky, especially (but not only) the sun. Yet Müller was not really a nature mythologist because for him the grandeur of the sky provides the ideal condition for the experience of the true object of worship. That object is not the sun but the immaterial "Infinite," which is symbolized by the sun but which itself is nonphysical. Müller was the founder of religious studies precisely because he did not reduce God to the sun or to any other natural entity.

In some respects, Müller's approach to religion appears forlornly outdated—surely not unusual

for one who was writing more than 100 years ago. For example, someone so resolutely committed as Müller to comparativism would seem abhorrent to the dogmatic anti-comparativism of postmodernism. Müller's assumption that we intuitively and directly apprehend the world itself and that language merely articulates—if not corrupts—our knowledge of the world would today seem mortifyingly naive.

Various basic tenets of Müller's theory of religion have always been debatable. For example, Müller pits religion against mythology, subordinates mythology to philology, deems religion universal, deems religion irreducible, and reconciles religion with science.

Müller Versus Tylor on Religion and Myth

The best known of Müller's positions is his derivation of mythology from a "disease" of language. Take the opposite view, that of his rival E. B. Tylor, the pioneering English anthropologist (*Primitive Culture*, 1871). For Tylor, myth arises within religion. Without myth, there would still be the belief in Zeus as the god of thunder and lightning. But there would be no stories of the life of Zeus, of the acquisition of his powers, and of his use of those powers. Myth provides all three. For Tylor, both myth and the rest of religion were meant to be read literally. Symbolic readings of myth are modern anachronisms and are intended to preserve myth for moderns, who cannot accept a literal reading because of the conflict with science.

Where, then, for Tylor moderns misread myth by taking it symbolically, for Müller ancients themselves mistakenly came to take literally their originally symbolic personifications of natural phenomena, for which myths then had to be created. Originally, religion flourished without myth. There were no gods. There was only the Infinite. Where for Tylor "primitives" were incapable of symbolism, for Müller they were supremely capable of it.

Yet gradually, mere metaphors for the physical manifestations of the Infinite came to be taken literally. The sea was initially described poetically as "raging," which was then taken to be the characteristic of the personality responsible for the sea, and a myth was then invented to account for this characteristic. The metaphors properly recognized as metaphors by earliest humanity came to be misunderstood by later, if still early, humanity. Myth itself was taken literally from the outset. Mythology for Müller stems from the absence, in at least some ancient languages, of a neuter gender. Speakers therefore had to refer to impersonal entities in the male or female gender, forever after misleading their descendants into taking the referent to be a person rather than a thing.

Where for Tylor religion, including myth, is really about the physical world, for Müller religion is originally and properly about the immaterial Infinite, merely symbolized by the sky and other physical entities. But religion, in 19th-century fashion, is still rooted in the physical world. Myth, a corruption of religion, is about gods rather than the Infinite. Still, the gods are gods of nature. For Müller, neither religion nor myth is the projection of something human or social onto the physical world. Neither of them is the confusion of something outside the physical world with something in it, as 20th-century theorists would maintain. Rather, religion is really about a quality of the physical world, even if that quality symbolizes something beyond the physical world (see Müller, 1878, Lecture 1).

As opposed to Müller's view of myth as Tylor is, he grants Müller's disease of language a secondary place in the "formation of myth." Contrary to Müller, Tylor insists that myth arises primarily from reality—from the actual experience of the physical world. The primitive, and also modern, experience of the world is above all of motion, such as that of the falling of rain or the growing of a plant. Myth is a scientific-like inference to account for the motion, and the inference comes from analogy to the purposeful behavior of human beings. For Tylor, "the difference in nature between myth founded on fact [Tylor] and myth founded on word [Müller] is sufficiently manifest." Tylor is prepared to concede that "more advanced" peoples would have been capable of thinking symbolically, so that the mistaking of the initial metaphor for a literal personification could have arisen among them. But "primitive" peoples are for him at once too materialist and too literalist ever to have turned mere language into reality, which is to say, into gods.

Müller's Debates With Andrew Lang

In his time, Müller engaged in many famous debates with the Scottish man of letters Andrew Lang (1844–1912). In Lang's earlier writings—*Custom*

and Myth, the first edition of *Myth, Ritual and Religion* (1887), and *Modern Mythology: A Reply to Max Müller*—he seeks to refute Müller's theory of myth. Lang is here a faithful follower of Tylor. Accordingly, myth presupposes "animism," which is Tylor's term for religion, or the belief in gods, in all natural phenomena. The decisions of gods account for events in the natural world. For earlier Lang, as for Tylor, myth and the rest of religion operate in tandem. Religion does not degenerate into myth. Where Tylor accepts Müller's linguistic explanation of myth as a secondary origin of religion, Lang rejects it altogether and does so in the name of Tylor!

In Lang's later writings—*The Making of Religion*, the second edition of *Myth, Ritual and Religion*, and *Magic and Religion* (1901)—he seeks to refute Tylor's theory, not of myth but of religion. There is no mythology in this first stage of religion both because there is only one god, who therefore cannot interact with other gods, and because that god is nonanthropomorphic and so does not act in human-like ways. So ethereal and sublime is this pristine conception of god that it simply cannot last and eventually degenerates into Tylor's polytheism, which now becomes the second stage of religion. Only now does mythology arise—to account for the nature of these gods. While mythology still serves to account for events in the natural world, as part of degenerate religion, it is now itself considered degenerate.

Most ironically, Lang's position thus becomes almost identical with Müller's: Pristine worship of an impersonal god degenerates into the worship of many anthropomorphic gods, the nature of whom mythology arises to account for. Yet Lang never enlists Müller against Tylor. Where for earlier Lang, as for Tylor, myth is a part of religion and completes its explanatory function, for later Lang, as for Müller, myth is pitted against religion, which is to say, original, prelapsarian, true religion.

Current Perspective on Müller's Theory

Müller's theory of religion and of myth seems at best quaint. Present-day theorizing is a throwback to Tylor in its focus on personification, or anthropomorphism, as the heart of religion. A work like Stewart Guthrie's *Faces in the Clouds* (1993) seeks to explain the naturalness of personification, just as Tylor does. Rather than a fall from a pre-personified stage, religion is taken to be personification from the start, and even religions apparently without gods are assumed to have them. Müller's equation of personification with a fall in the course of religion is nowhere accepted today.

Murdock, George Peter

George Peter ("Pete") Murdock (1897–1985), the American anthropologist, made seminal contributions to the study of kinship and is among the founders of cross-cultural research.

Biography and Major Works

Murdock was born and raised on a farm in Meriden, Connecticut. He worked on the farm until his matriculation at the Phillips Academy in Andover, Massachusetts, from which he graduated in 1915. He went on to attend Yale University, earning a bachelor's degree in history in 1919. Following a year of law school and a year traveling through Europe and Asia, Murdock returned to Yale and began work on a doctoral degree in anthropology, which he was awarded in 1925. He taught for 3 years at the University of Massachusetts, then returned to

Yale in 1928 with a joint appointment in anthropology and sociology. He helped found the Department of Anthropology at Yale in 1931 and twice served as the department chair. Murdock moved to the University of Pittsburgh in 1960, where he remained until his retirement in 1973.

Murdock had first sought to do graduate work in anthropology at Columbia University, but Franz Boas rejected his application, and Murdock turned to his former professor at Yale, Albert G. Keller, who encouraged him to matriculate at Yale. The relationship between Columbia and Yale was strained at the time—Columbia, under the firm leadership of Boas, was dedicated to historical particularism, whereas Yale had become dedicated to cultural evolution through William Graham Sumner (a devotee of Herbert Spencer) and his students, including Keller. Murdock's rejection at Columbia and acceptance at Yale drew him fully into the cultural evolution group, an approach to anthropology he supported for the rest of his career. Indeed, Murdock's dissertation was a critical translation of the German anthropologist Julius Lippert's seminal work on cultural evolution, which Murdock later published as *The Evolution of Culture* (1925).

During the first few years of his professional career, Murdock conducted fieldwork among the Haida and the Tenino, but situated as he was at Yale between two departments with differing approaches to social science, Murdock understood, in a way that perhaps other social scientists working at the time could not, the need for integrative work on human culture and behavior. The direction he chose was cross-cultural research, which at the time faced major problems in both methodology and data access. In 1937, Murdock launched the Cross-Cultural Survey to address these problems. Murdock also published a seminal article that year in which he outlined what would become the basis of cross-cultural research to this day. He argued that cross-cultural comparisons must be based on a worldwide sample of unrelated cultures, that the variables used must be clearly defined and measurable, and that any relationships or patterns found must be evaluated using the appropriate statistics.

The Cross-Cultural Survey and Human Relations Area Files

The initial work of the Cross-Cultural Survey included collecting and organizing ethnographic information in a systematic way. Murdock and colleagues at Yale developed the *Outline of Cultural Materials* (1938) as a basic framework for organizing the collected ethnographic information. The *Outline* provides a three-digit hierarchical system for classifying the information found in ethnographies. The *Outline* was initially used to classify information on 90 cultures. It was then revised, and the work of the Cross-Cultural Survey continued until World War II. By that time, ethnographic information on 150 cultures had been collected and organized.

Murdock believed that the information collected by the Cross-Cultural Survey might be useful to the U.S. military fighting in the Pacific. He enlisted in the navy along with his colleagues Clellan S. Ford and John M. W. Whiting, and he worked with them to produce a series of Civil Affairs Handbooks that described the cultures of the islands of Micronesia, Okinawa, and Taiwan. These were used extensively by the military government both during and after the war. Murdock recognized the importance of cultural information to government administrators at the end of the war and organized a massive program of ethnographic and linguistic research in Micronesia under the auspices of the Office of Naval Research. Murdock continued to work in the Pacific for the rest of his career and was a central figure in developing the Bernice P. Bishop Museum of Pacific Culture and Natural History in Honolulu, Hawaii.

After the war, Murdock returned to Yale and transformed the Cross-Cultural Survey into a multi-institution consortium, the Human Relations Area Files (HRAF). This nonprofit organization located at Yale was incorporated in 1949 to provide multi-institutional access to the information being collected and organized by the Cross-Cultural Survey. Eight universities formed the initial consortium, each receiving an annual installment of ethnographic texts typed onto 5- by 8-inch paper slips, the slips themselves organized by *Outline of Cultural Materials* numerical codes for the information contained on that page of text. Thus, scholars at HRAF consortium institutions could immediately access information on a topic of interest from many ethnographic sources without having to search each source individually. In 1958, the annual installments were converted to microfiche, and consortium membership was opened to any institution wishing to join. Today, the HRAF has more than 400 member institutions in 25 countries.

Social Structure

One of the first major works to be based on the HRAF collection of ethnographic materials was Murdock's *Social Structure* (1949). The book is divided into three major parts. The first half of *Social Structure* describes the variety of family, kin group, descent group, and community forms found in 250 cultures. From this descriptive information, Murdock attempts to explain how this variety came to be. In the second part of the book, he explores the evolution of kinship, marital residence, and descent. He reviews existing ideas and demonstrates them to be inadequate explanations for the cultures in his sample, and he then goes on to propose and test a large number of alternative explanations. Murdock undertakes a similar task in the third part of *Social Structure*, but focusing on the regulation of sexual behavior, which he shows also varies widely among the cultures of the world.

Social Structure is a key work in the history of anthropology, for two primary reasons. First, Murdock demonstrated that it is possible not only to systematically describe variation in human culture but also to develop empirically testable explanations for the origins of specific variations. While other scholars had developed explanations for the varieties of kinship, few had been tested in any systematic way, and none with the thoroughness that Murdock demonstrated. Second, Murdock's explanations showed that culture is an integrated whole rather than a "thing of shreds and patches," as Robert Lowie suggested (and many others accepted). Indeed, within Murdock's explanations can be seen the germs of later understandings of culture as an adaptive mechanism or process within human societies.

Africa: Its Peoples and Their Culture History

Following *Social Structure*, Murdock embarked on a program to produce systematic ethnographic overviews of each major region of the earth. His first effort, and the only one to be completed, was *Africa: Its Peoples and Their Culture History* (1959). Murdock did initiate bibliographical research on North American cultures, which developed into the seminal *Ethnographic Bibliography of North America* (first published in 1941 and regularly updated until 1990) and a summary volume on South American cultures. But neither of these works approached the scale of *Africa*. In *Africa*, as in *Social Structure*, Murdock not only provides descriptive information but also attempts to develop and test explanations for cultural variation. He begins by considering the prehistoric peoples of a given region in Africa, then employs archaeological, linguistic, environmental, and ethnographic data to trace how particular cultural features developed. The work is thus both descriptive and explanatory, and although many of the explanations were not widely accepted, *Africa* provided a compelling example of the power of systematic comparative studies.

Ethnographic Atlas *and the Cross-Cultural Cumulative Coding Center*

Despite the importance of the works already discussed, Murdock's most enduring contribution to anthropology is the *Ethnographic Atlas*, published in serial installments in the journal *Ethnology* between 1962 and 1971 and in two summary books from the University of Pittsburgh Press, one published in 1967 (*Ethnographic Atlas*) and the other published in 1980 (*Atlas of World Cultures*). The complete *Ethnographic Atlas* contains coded data for 1,270 cultures on 110 variables, while the 1967 and 1980 summaries contain coded data on the most well-described 862 and 563 cultures from the complete *Atlas*, respectively. Murdock himself coded the data for the *Atlas*, but he was also aware that one person could only code a tiny number of variables—broader and more systematic data coding was needed.

To create a large number of coded variables, Murdock and his colleague Douglas White created the Cross-Cultural Cumulative Coding Center at the University of Pittsburgh in 1962. Researchers at the Cross-Cultural Cumulative Coding Center did not simply organize ethnographic texts (as had been done at the Cross-Cultural Survey), but they actually coded the information in the texts for different variables across many cultures. With these precoded variables, a researcher could conduct exploratory research or test hypotheses to explain the variation in human culture and behavior. These variables were coded for 186 of the world's best described cultures, selected by Murdock and White to provide a representative sample for statistical tests, called the Standard Cross-Cultural Sample. Researchers at the Cross-Cultural Cumulative Coding Center published some 650 variables (primarily in *Ethnology*) for the Standard Cross-Cultural Sample, and other

researchers have now published more than 1,350 additional variables.

Murdock's Legacy

Murdock's legacy is threefold. First, he made seminal contributions to our understanding of kinship and particularly to our understanding of how and why kinship systems change. Second, Murdock was an important leader and administrator, helping to found independent anthropology departments at both Yale and the University of Pittsburgh, helping to create the HRAF, serving as the director of large-scale ethnographic projects for the Office of Naval Research, helping the Bernice P. Bishop Museum to develop into a world-class institution, and serving as president of both the Society for Cross-Cultural Research (of which he was a founding member) and the American Anthropological Association. Third, Murdock created or assisted in creating three major sources of data for cross-cultural research: (1) the HRAF collection of ethnography, (2) the *Ethnographic Atlas*, and (3) the Standard Cross-Cultural Sample. These data sources remain seminal in cross-cultural research and will remain so for many, many years.

Musée de l'Homme

Officially opened on the 20th of June, 1938, the Paris Musée de l'Homme (Museum of Mankind) was, along with those in the Soviet Union, among the very rare anthropology museums created in the 1930s. Considered the most modern museum of its time and highly innovative in terms of museography, this "Temple of Mankind"—according to the words of its founder, Paul Rivet—represented the desire to embody a new scientific humanism in a period characterized by the apogee of colonial imperialism (the 1931 International Colonial Exposition in Paris drew more than 8 million visitors and sold more than 33 million tickets), a vogue for primitive art, the institutionalization of ethnology as a university discipline, the economic crisis and growing industrialization, and also the rise of totalitarianism in Europe, including fascism and Nazism, the latter of which made a devastating misuse of the notion of race. All these factors left their mark in the discourse of the display rooms of a museum whose heyday, although brief, began paradoxically even before it was opened.

Beginnings

In fact, the Museum of Mankind was the heir to the Trocadéro Ethnographic Museum (TEM) on the same site, founded in 1878 by Ernest-Théodore Hamy for the Universal Exposition. The Trocadéro Museum had become derelict but was resurrected from 1928 on through a deep-reaching reorganization carried out under the ambitious and strong-willed direction of the Americanist anthropologist Paul Rivet (1876–1958), powerfully assisted by an inventive and brilliant vice director, Georges Henri Rivière (1897–1985). Rivière was to be the founder of the National Museum of Popular Arts and Traditions (Musée National des Arts et Traditions Populaires) in 1937, which took in the French ethnographic collections left aside by the Museum of Mankind. Rivet requested that the TEM be placed under the scientific supervision of the National Museum of Natural History and the Ministry for Public Education, thus leaving the aegis of the Fine Arts Ministry. The prestige of exoticism and primitive arts among travel writers and avant-garde artists—among them the surrealists—favored the

renewal of interest around the TEM, where ethnologists and artists collaborated in the short-lived but passionate journal *Documents* (1929–1931), founded and directed by Georges Bataille.

The urban planning projects undertaken in preparation for the 1937 International Exposition of Arts and Techniques in Paris provided Rivet and Rivière with the opportunity to see their own museum modernization project materialize, which they had been working on since 1931. Before the TEM closed its doors for renovation in August of 1935, it had been the site of 7 years of exciting activity that represented the prehistory of the Museum of Mankind, making it one of the highlights of Parisian culture and science, at the same time as it established ethnology as a legitimate field. Those were the years during which a scientific team (Rivet, Rivière, Michel Leiris, Jacques Soustelle, André Schaeffner, etc.) was set up to plan out the scientific project of the Museum of Mankind, including important ethnographic missions such as the famous Dakar-Djibouti mission (1931–1933) and the Franco-Belgian mission to Easter Island (1934–1935).

Housed in the Passy wing of the new *Palais de Chaillot*, the Museum of Mankind opened officially in 1938, a year later than planned, hence well after the closing of the International Exposition. The delay was due to financial problems that were to be recurrent throughout its history and would eventually precipitate—and accompany—its long decline, beginning in the 1960s. The problems were exacerbated by the fact that the museum was funded only by its ticket sales. The recurrent budget issues emphasize the extent to which the very idea of the existence of an anthropology museum never really caught on with the French authorities, nor was it ever to be a priority for the ministry responsible for it. It is thus quite false to say that the Museum of Mankind was a creation of the Popular Front, the political coalition that governed France in the mid-1930s. What is accurate, however, is that Rivet was deeply involved in Popular Front politics and had been elected as a Socialist Town Councilor in 1935. These political connections were to help Rivet get together the much needed financing for the museum. Furthermore, the Popular Front's political ideals of democratization and of popularizing the sciences for the working masses corresponded perfectly with Rivet's and with those of his team of ethnologists, most of whom were left leaning politically. They had a militant conception of ethnology as responsible for watching over the education of the people to enable them to appreciate diversity and otherness, in order to combat the stereotypes about peoples categorized as primitive or backward, to restore their dignity and valorize their culture and skills. To them, the paramount mission of ethnology was facilitating better understanding among peoples and nations, propounding racial equality, and supporting the struggle against racism. The museum organized lectures and visits guided by ethnologists and stayed open late in the evenings to welcome workers after their working hours.

The Museum, Its Mission, and Its Context

Although the Museum of Mankind was explicitly defined as a colonial museum—not to have done so would have been absurd, in view of the reality of French imperialism—the declaration of the museum's intentions had a certain air of opportunism. It was not aimed at the representatives or the members of societies subject to the colonial yoke (and we must emphasize that the history of their colonization went unmentioned) but rather toward a national, Occidental public. (It was more a question of reshaping the mores of fellow citizens and discouraging their inegalitarian prejudices.) The underlying ambition—which was to remain wishful thinking—was to humanize colonial administrative policies as a result of the knowledge and expertise acquired by ethnologists. Those in charge of the Museum of Mankind were in constant contact with their peers abroad, as well as in France and its colonies, seeking to set up a network of ethnographic institutions and museums, which would be the overseas satellites of the central institution represented by the Paris museum. Rivet and Rivière did not adhere to any scientific agenda imposed by the Colonial Ministry, nor did they have the feeling of compromising their principles, yet they regularly tried to present the value of ethnology to colonial authorities in a highly pragmatic way to legitimate the existence of the museum. In particular, they sought to underwrite its development and influence, request funding, facilitate ethnological missions to their colonial territories, assist in professionalizing the students in the University of Paris Ethnology Institute, and so on. They did not question colonialism but hoped for a better treatment of colonial peoples within the French Empire.

In the same way, the struggle against racism took place in a scientific and historical context that was quite particular and influenced by European political events. In 1930s Europe, combating racism did not necessarily mean combating all forms of racism. There was little effort to combat ideas of Black inferiority. Instead, anti-racist efforts of the era were aimed more at the virulent anti-Semitism and intra-European racial pseudoclassifications that set up a hierarchy among the "Alpine," "Nordic," and "Aryan" races. Openly perceived—and rightly so—as an anti-racist institution, the Museum of Mankind invited its visitors to follow an educational circuit beginning with the Grand Gallery of Physical Anthropology (covering an area of 1,000 square meters), before leading them to the ethnographic galleries (covering an area of 3,650 square meters). According to Rivet, this gallery was so successful with the public because it provided them with clear information on the evolution of humanity as an animal species; on the absence of racial determinism, the profoundly arbitrary character of racial classifications, such as the existence of a "Jewish race"; and on the very ancient mixing of human beings, which makes these classifications nonsensical. Still, the museum presented the three great "races" of the world (Black, Yellow, White) according to an evolutionist scheme, with the "White race" as the culmination of the lineage. Before World War II, although the most progressive anthropologists insisted on the many limits and defects of the concept of race, the racial paradigm was still so deeply embedded in the popular interpretation of human diversity that they felt it would have been premature to attempt to eliminate it.

Compared with other countries with a strong tradition in anthropology (Germany, England, the United States), the Museum of Mankind held a unique place. Internationally, the institutional links between ethnographic and anthropological museums and the academic study of anthropology were weakening—it was the end of the "museum movement"—and anthropology was increasingly anchored in university departments and able to distance itself conceptually from ethnographic objects to shape a real social and cultural anthropology. However, in France, these relationships remained consubstantial and fusional for more than 30 years, right into the 1960s. There was no French ethnologist active in the 1980s and 1990s who had not been trained at the Museum of Mankind. More influential than the University of Paris Ethnology Institute created in 1925, it was thanks to the museum that ethnology was able to present itself as a legitimate field and discourse on the "Other," both scientifically and culturally, and was able to turn up its nose at the academic and institutional resistance that weighed on the field. Thanks to the museum, ethnology was able to take a shortcut to long-delayed recognition. This was to have profound repercussions on the role, status, and scientific functions of the Museum of Mankind. The museum's curators invented the notion of a "museum-laboratory" to reconcile the traditional missions of conservation, exhibition, and popularization with research on collections of ethnographic objects and the organization of ethnographic missions whose paramount objective was to bring back objects that would fill the museum's collections.

As Rivet had wished, the Museum of Mankind was thus far more than an anthropology museum: Three times larger than the old Trocadéro museum, it held collections on prehistory, paleontology, and physical anthropology, as well as ethnographic objects—its very name, which was revolutionary, stressed the ambition of disciplinary generalization that underlay it. However, it was also a center for scientific documentation (including a movie theater), teaching (with classrooms for the students in the Ethnology Institute), and research. It housed several learned societies and was the hub of a network of scientific institutions centering on it.

The Exhibitions

The museum exhibitions ran from the biological to the cultural and included prehistory. The way the exhibit rooms were set up reflected both a geographic and a thematic logic: the gallery of physical anthropology, the department of Black Africa, with a section dedicated to Madagascar, the gallery of White Africa (North Africa and the Near East), the European gallery, the Arctic department, the Asian gallery, then Oceania, and the Americas, which were the largest sections with Black Africa. Each gallery was divided into display cases arranged along either generalizing or thematic lines. The last gallery, dedicated to Arts and Techniques, was highly innovative in endeavoring to show the unity of the human spirit by highlighting the manual and artistic skill of people who understood how to adapt

to their environment. At a time when mechanization and Taylorism were becoming more and more dominant in industry, this room deliberately turned away from cultural hierarchies and regional division to valorize manual work. For a committed socialist like Rivet, this argument took on all its importance: For the man of the people, for the worker visiting the museum, the opportunity to see primitive crafts and technologies enabled him to identify with and understand what he had in common with people from outside his own culture: technical know-how and artistic sense. As a conservatory of the material civilization of peoples around the world, the Museum of Mankind defended a definition of the ethnographic object as a "witness object" that personified and revealed the very essence of the society that made it.

Decline and Renewal

However, after Rivet's departure in 1939, the Museum of Mankind was unable to continue occupying the quasi-monopolistic place it had once held within the field of anthropology. The professionalization and growth in the number of anthropologists, the creation of teaching chairs and university laboratories in Paris and the French provinces, and the arrival of social anthropology and structuralism were changing the nature of the discipline. After Rivet's departure, the museum was led by uncharismatic directors without scientific ambition for the museum. It gradually entered into a slow institutional and intellectual decline, which became particularly evident from the 1970s on. It was only the grand exhibits of primitive art organized by the Society of Museum Friends in the 1960s and early 1970s that were able to attract a good number of visitors and were a real success. The museum was unable to adapt to the changing attitudes surrounding decolonization in the 1950s and 1960s and went on showing exotic societies as outside modernity, culturally pure. So poorly endowed financially, struggling day by day to scrape together enough money to redo a gallery or a room, the museum was not able to modernize and follow museological developments and the new thematic and theoretical interests of anthropologists, who now rarely collected objects during their ethnographic fieldwork. After the creation in 1972 of three teaching chairs for biological anthropology, prehistory, and ethnology, each with their own galleries, laboratory, and scientific personnel, the Museum of Mankind went into a kind of paralysis, undermined by rivalries that were both personal and scientific. Renovation projects in 1976, 1987, 1992, and 1995 all failed. Running on a ridiculously tiny budget by the 1990s, the museum was unable to attract even 200,000 visitors a year, and those who visited were primarily schoolchildren who came to hear the anti-racist program of the permanent exhibit in the gallery of biological anthropology, which had been totally renewed in 1992 and 1994.

After many a twist and turn, the museum's unity was broken up—painfully—in 2003, when the ethnographic objects were moved to the Quai Branly museum, which opened to the public in 2006. The old museum retained only its osteological, prehistory, and biological anthropology collections. It closed for good in 2009 and is to be opened again before 2020, with a new museological and scientific project based on the relationship between humankind and nature.

Myth, Theories of

Theories of myth are methods of finding meaning in myths. They do so by attempting to explain the content, form, function, and history of myths. Because myths are of interest to scholars in many disciplines, anthropologists have been able to supplement their own theories with those from other fields. What follows is a roughly chronological look at the ways in which anthropologists have used theories of myth. It should be understood that all of the theories

discussed here are much more complex and nuanced than space allows us to describe.

An important aspect of theories of myth to understand is that they begin when myths cease to be taken literally. A widespread myth is that of the separation of the sky from the earth, usually through the efforts of one of their offspring. To accept this as a literal account of history is not to make a theoretical interpretation. It is only when someone says that this story is a metaphor or allegory, or that it can be understood symbolically that we enter the theoretical mode of interpretation.

The 19th Century

Systematically theorizing myth began in earnest in the 19th century, and anthropology played a large part in its development. In the 1870s, Edward B. Tylor wrote about myth as a system of thought that sought to explain the natural world. In this respect, he believed myth to be like modern science. Tylor proposed that those who believed in myth took it literally. Its origin was in attempts to explain the world and people's place in it. This work, including Tylor's explanation of the concept of animism, has been very influential.

In the 1870s and 1880s, a debate arose in England about the origin and meaning of myth. It centered on two figures, Friedrich Max Müller and Andrew Lang. Müller studied ancient languages; Lang was an anthropologist. The debate started with Müller's argument that all myths could be traced back to stories told about the movement of the sun across the sky and that the way to determine this was to look at the history of the names for gods. Lang countered that this was an absurd theory to apply to every myth, and that the data from anthropology exposed it as misguided. This is one of the earliest applications of the idea that a theory of myth can be tested by using data collected from anthropological fieldwork. By the early 20th century, the theory of solar mythology was largely discredited. Yet, like many theories, some of its tenets remained. After all, some myths really are about the sun.

The 20th Century

Theorizing myth became even more prominent in the 20th century. As the results of fieldwork, notably that of Franz Boas and his students, became more and more available, the number of myths that could be studied—and their variety—increased dramatically. Ethnography determined the course of much of the theorizing. For example, functionalists like Bronisław Malinowski and E. E. Evans-Pritchard used their experiences in the Trobriand Islands and Africa to argue that the elements of a culture, including myth, work together to ensure that culture operates smoothly. In particular, Malinowski argued that myth provides explanations of the physical world and justifications of the social world. He famously called myth a "social charter."

During the same period, the myth-ritual theory became prominent. This concept originated in the 19th century with the writings of a scholar of ancient cultures named William Robertson Smith. Smith first put forward the idea that myths arise to explain rituals. This idea was picked up in the 20th century by James G. Frazer in his multivolume study *The Golden Bough*. Frazer argued that rituals have initial explanations that their current performers have forgotten, so they invent myths to explain how the rituals came about and why they take the form they do. The myth-ritual theory roots myths in an explanation that says the gods (or other culture heroes) originally performed certain deeds that humans echo in ritual, in particular rites of renewal, often related to agriculture and fertility. Criticism led most mythologists to abandon this theory, but in recent years, it has gained back some ground.

Psychoanalysis also became popular in the 20th century as a means to understand myth. Begun by Sigmund Freud, the psychoanalytic view of myth can more or less be reduced to understanding myth as a product of the subconscious. Myths, as they attempt to express the less savory sides of the psyche, become distorted by the defense mechanisms of the subconscious. Thus, a symbolic reading is necessary. Most famously, Freud proposed that the myth of Oedipus, in which Oedipus unknowingly kills his father and marries his mother, reflected an unconscious, universal psychological drive in preadolescent boys. Anthropologists began searching for evidence of the complex in non-Western cultures, with mixed results. More a victim of changing fashion than of any direct refutation, psychoanalysis does still have advocates.

In the middle of the 20th century, the anthropologist Claude Lévi-Strauss applied concepts from structural linguistics to myth. In structuralism, any part of a given myth only has meaning through its

relationships to other parts, to other versions of the same myth, and to the entire body of myths known to a group and its neighbors. Lévi-Strauss proposed that myths carried unconscious universal messages, and he looked for binary oppositions, or elements in a story that oppose each other (up/down, east/west, nature/culture, life/death), as a way to understand the thoughts expressed in myth. Though structuralism is about the relationship between the elements in a myth, its conclusions are about function: Lévi-Strauss proposed that myths help people overcome a contradiction they see in the world by providing another contradiction, one that is soluble, into which the first can be absorbed. Though it was embraced by many anthropologists, others found that many field studies could be used to argue against the basic tenets of structuralism.

From the discipline of religious studies, the ideas of Mircea Eliade reached publication at about the same time as those of Lévi-Strauss. Eliade believed that myths functionally brought the past into the present, so that modern people could walk in the footsteps of gods and ancestors. This was not the recent past but the mythical past, which Eliade called "*illo tempore*" ["at that time"]. It was sacred time, and so myth and ritual became ways to sanctify contemporary life. In this way, there are similarities between this and the myth-ritual theory, both of which have to do with constructing the present in terms of the past. Eliade's writings, however, are more nostalgic and are focused on the individual rather than on nature. For Eliade, myth involves a spiritual rebirth, and in this sense, it is therapeutic.

It should be noted that none of these theorists operated in a vacuum. Each had influences, and importantly, each has followers. Though the theorists above are rarely overshadowed by these followers, later writings often revise or flesh out a theory beyond its initial formulation. Lévi-Strauss was followed by anthropologists such as Edmund Leach, who was as much a critic of structuralism as one of its theorists; Freud was followed by Alan Dundes, who applied psychoanalysis to anthropological data.

Other Theories

There are other theories of myth that have had little impact on anthropology. Theories stemming from literature, such as the writings of the Canadian critic Northrop Frye, have found little in common with the ethnographic nature of anthropological scholarship outside the interpretive anthropology championed by Clifford Geertz. Likewise, Joseph Campbell's work on myth, while extraordinarily popular outside the academic community, has not had much effect. Anthropologists have focused on the ethnographic perspective, and theories that stem from the study of literature have been excluded not necessarily because they are faulty but because they address different concerns. Literature operates quite differently than oral tradition, which has been one of the provenances of anthropology.

Ethnography, Theory, and the Comparative Study of Myth

The ethnographic nature of anthropology has directed much of its course with regard to myth. Anthropologists have worked hard to collect myths from around the world and to study them in their contexts when possible. This attention to context has led to performance studies in which scholars look at myth as situated in living enactment, being told by specific individuals. A performance study attends to audience response as well as the artistry of the performer, and sees that the line between these roles is sometimes blurred. This performance-centered perspective provides the opportunity to enhance other theories because it is rich with data.

The anthropological study of myth has always been the combination of ethnography and theory. Frazer exemplifies this principle, synthesizing the results of others' fieldwork and exploring them with his own ideas. Frazer also exemplifies the comparative nature of some anthropological approaches to myth. Born out of the observation that many myths seem similar despite the extraordinary distances between their tellers—such as the separation of sky and earth, which exists in a broad swath over much of Europe, northern Africa, Asia, and the Pacific Islands—the comparative study of myth seeks to explain and interpret those similarities.

Another anthropological perspective on myth is the linking of elements of myth with other elements of culture. Boas's approach was typical of this method of analysis. He saw myth as a mirror of culture, finding in myth elements that exist in real life, such as material culture, kinship, and reciprocity systems. Ruth Benedict, who studied the Zuni so fruitfully, was critical of this. She noted that myths often

depicted events, characters, and situations that had never existed in Zuni life but instead were something along the lines of wish fulfillment or daydreaming fantasy. She saw in them a psychological resonance.

There are some obvious similarities between the theories. Both structuralism and psychoanalysis are about the operations of the human mind. Both functionalism and myth-ritual theory are about how myths operate within a culture. But the differences are equally as important. Earlier theories tend to be diachronic—that is, they focus on history, explaining how myths arise and develop; such is the case with the myth-ritual theory of the 19th century. The diachronic approach was especially popular in the context of 19th-century evolutionary thinking, in which scholars believed that all societies passed through progressive states of development, roughly from savagery to civilization, and mythical thinking was associated with early stages of evolutionary development. But as myth theory developed in the 20th century, this approach was displaced by the synchronic approach, which examines how myths operate in the present. This is the method of functionalism and structuralism.

Theories have shaped not only the understanding of myths but also how they are collected and published. Structural theorists, for example, can rely on fairly rough summaries, whereas for students of performance, the ideal is to collect and present myths in a form as close to performance as possible. Thus, theories of myth have become intertwined with the myths themselves, as if they are new variants of the old stories.

N

Nader, Laura

Laura Nader (1930–), American cultural anthropologist, University of California–Berkeley professor for more than 50 years, and coiner of the phrase "studying up," is among the most important cultural anthropologists of the end of the 20th and beginning of the 21st centuries.

Biography and Major Works

Laura Nader was born in Connecticut, the third of four children of immigrant Maronite Christians, Nathra and Rose Nader. Her parents had fled the political turmoil of their native Lebanon. She was raised in a bilingual household (English and Arabic), where education was clearly valued. All of her siblings earned college degrees, with her older sister Claire earning a PhD in political science and her younger brother Ralph (the famous consumer advocate and several-time presidential candidate) earning a law degree from Harvard. But it was her older brother Shafeek who recommended that she take up anthropology. He did so after Laura almost did not graduate from Wells College in 1952, when the Spanish literature department rejected her honors thesis on Mexican revolutionary novels as too sociological and the sociology department said they could not count her as a sociology student since she had taken no courses in their department. At that time, Shafeek sent her a copy of Clyde Kluckhohn's (1944) book *A Mirror for Man*. In a 2012 address at the University of California–Berkeley's anthropology department's graduation ceremony, Nader characterized two chapters of that book as particularly memorable—"An Anthropologist Looks at the United States" and "An Anthropologist Looks at the World"—and explained that the book was a key reason why she began her doctoral program at Harvard, studying with Kluckhohn.

Starting at University of California–Berkeley in 1960 (and still working there full time, as of this writing, in 2012), from the beginning of her professional career, Nader has juxtaposed being an anthropologist who looks at the United States with one who looks at the world beyond its shores. As one way to measure this juxtaposition, 11 of the 54 dissertations that she has chaired were based on fieldwork in the United States. Of the remaining 43, 10 were based in Mexico, 3 each were in Lebanon and Saudi Arabia, and the remainder spanned the globe from China to Ghana to Sweden. The preponderance of studies in the United States, Mexico, and the Middle East is not surprising. She has been based in the United States all her life, and her perhaps best known article "Up the Anthropologist"—which was a chapter in Dell Hymes's edited 1969 volume *Reinventing Anthropology*—recommended that a reinvented anthropology should study powerful institutions and bureaucratic organizations in the United States because such institutions and their network systems affected American anthropologists (and many others) as Americans, as well as affecting the lives of people whom anthropologists have traditionally studied all around the world. Her doctoral dissertation and many of her published articles and books are on the Zapotec and other indigenous

groups of Oaxaca in Mexico. Her family background, language skills, and the ongoing status of the Middle East as a central (and from a Western perspective, poorly understood) part of the world make it logical that she would consider this part of the globe as well.

Critical Contributions to Anthropology

Summarizing Nader by the geographies of *where* she is interested in seems to distort a more important focus on *what* she has studied. Her interest in the *anthropology of law* or, phrased another way, the ways societies identify and respond to conflicts and trespasses has been long-standing and central, as three of her book titles make clear: *The Disputing Process: Law in Ten Societies* (1978), with Harry Todd; *No Access to Law: Alternatives to the American Judicial System* (1981); and *Law in Culture and Society* (1969/1997). In 1965, she edited a special issue of *American Anthropologist* with the theme "The Ethnography of Law." She has been a visiting professor at Yale University Law School and is a trustee of the Law and Society Association and the Center for the Study of Responsive Law.

Still, summarizing her as an anthropologist of the law also feels misleading, not because it is wrong but rather because it is incomplete. At least three other intertwined quests define Nader's work: She is a skeptic of the status quo (particularly of how it perpetuates advantage and disadvantage), she sees her work as moral without that compromising its empiricism, and she is a tireless champion of anthropology. Her core complaints in "Up the Anthropologist" were that ethnological theory was distorted and that the social utility of anthropology was compromised if anthropology only looked at the marginalized, the exotic, and "the colonized" and not at those who were wielding power.

In a similar vein, the book *Naked Science* (1996), which she edited, considered how the use of empirical methods by groups traditionally conceptualized in the West as primitive (e.g., Polynesian seafarers) was not regarded as science, while the imprimatur of "Science" could lend power to ideas that were not disinterested and/or that excluded relevant data. More holistically, she worried that science is too often directed toward definitive answers to small questions rather than plausible answers to larger ones, that it is inherently political, that it is dominated by the quest for the universal rather than the particular, and that, in its invocation as "Big Science," it can be used to silence rather than include.

Nader's modus operandi has always been to extend and broaden the audiences of anthropological inquiry. As she noted in a distinguished lecture in 2000 to the American Anthropological Association, if anthropologists are ignorant of debates outside academia, they will increasingly find themselves mainly talking to each other, trapped in a diminished space, and working in cramped quarters.

As her career draws to a close (she is in her 80s at the time of this writing), Nader will likely be most remembered for her work with the Zapotec, the anthropologies of law and science, her advocacy for "studying up," her focus on conflict resolution, and her championing of anthropology as a vehicle to support democracy and inclusion. Nader has also argued for an "unencumbered anthropology," that is, an anthropology free of *isms* (be they Marxism, postmodernism, structural functionalism, etc.), where the imperatives of an ideological orientation are less important than asking socially relevant questions and insistently and perhaps eclectically pursuing the methodologies necessary to illuminate answers.

Nash, June

June C. Nash, Distinguished Professor Emerita at the City University of New York, Graduate Center and City College, is a founder of Latin American feminist and class-based ethnography.

Biography and Major Works

Nash was born on May 30, 1927, in Salem, Massachusetts, to Joseph (a carpenter) and Josephine (Salloway) Bousley. She counts a Penobscot Indian woman among her great-grandmothers. Nash graduated from Barnard College in 1948 and entered graduate studies at the University of Chicago at the height of postwar structural functionalism, studying with Professors Robert Redfield and Sol Tax. She completed her master's degree in 1953 and joined fellow graduate student and husband Manning Nash (m. 1951) in Guatemala for his doctoral research. Their stay overlapped with the Central Intelligence Agency–supported 1954 coup. Nash contributed maps and numerous interview censuses to Manning Nash's 1955 doctorate and first book. She published some of the earliest work on the conversion of Guatemala Mayans to U.S.-introduced Protestantism.

Nash earned her doctorate from Chicago in 1960, working within structural functionalism and the classic community studies framework and based on research from 1957 forward in Chiapas, Mexico, where she continues working to date. Nash then placed power, violence, and the Mexican state at the center of her 1970 monograph, *In the Eyes of the Ancestors* (Spanish translation, 1975), which documents a spike in homicides over a decade. The homicides, which many cast as executions of witches, reflect the competition among caciques allied with the Mexican ruling party, the Partido Revolucionario Institucional.

During 1960 and 1961, Nash worked in Burma with Manning Nash, before the 1962 military coup d'état ended the short-lived democratic republic. She maintained the structural-functional orientation in her study of how Burmese villagers near Mandalay dealt with *nats*, earth and ancestor spirits.

In 1967, scant weeks following a Bolivian government–ordered massacre of miners, Nash began a productive and activist relationship with that country's tin mining communities. She describes this experience as her consciousness-raising moment. From the 1970s on, Nash engaged with feminist, anti-imperialist, and working-class movements. She published *We Eat the Mines and the Mines Eat Us* (1979; C. Wright Mills Award honorable mention, 1980; Spanish translation, 2009). She cowrote an autobiography with the miner Juan Rojas, first in Spanish (1976), produced as a 1977 documentary film, and then translated in 1992 as *I Spent My Life in the Mines*. She coedited a series of influential volumes on women and class, with Helen Safa, *Sex and Class in Latin America* (1976) and *Women and Change in Latin America* (1986), and with M. Patricia Fernandez Kelly, *Women, Men, and the International Division of Labor* (1983). She undertook U.S.-based research on the multinational corporation General Electric and on the workers and community of Pittsfield, Massachusetts (*From Tank Town to High Tech*, 1989).

Nash moved her academic career from Chicago to the East Coast, first to Yale University from 1964 to 1968, then to New York University, and finally to the City College of the City University of New York in 1972 as professor of anthropology. She was married to the New York University sociology professor Herbert Menzel from 1972 until his death in 1987.

Nash returned to Chiapas in 1988, seeking a safe field site to train undergraduates. Her first collaboration, the 1993 anthology *Crafts in the World Market*, explored Mayan artisanal producers' location in a globalizing capitalist market. Since the 1994 Zapatista uprising and the ensuing state and paramilitary counterinsurgency, Nash has focused on Mayan claims for pluricultural autonomy, publishing an edited anthology with articles by students and colleagues, *The Explosion of Indigenous*

Communities in Chiapas, *Mexico* (1995), which was simultaneously published in Spanish; *Mayan Visions* (2001), with a Spanish translation in 2006; and *Social Movements: A Reader* (2004).

Nash shares homes with her husband, the religious studies scholar Frank Reynolds (m. 1997), in both Chiapas and a neighboring town of Pittsfield, Massachusetts. Her two children, Eric and Laura, are from her first marriage.

Critical Contributions to Anthropology

Nash is most associated with anti-imperialist Marxism, class-based feminism, and globalization studies (see her reflections on her 50 years of work with these paradigms in *Practicing Ethnography in a Global World*, 2007). Kay Warren points out, however, that Nash makes her greatest theoretical contributions by pushing every paradigm for greater ethnographic depth and focus on social justice, usually for the working poor and women. Nash has experimented with postmodern and poststructuralist analysis, most extensively in *Mayan Visions*.

The works of her entire career are consistently marked by a pragmatic and empirical orientation, which Nash attributes to coming of age during the anti-ideological environment following World War II. Her goal is to write ethnographies that outlast any original but discarded paradigm and allow others to propose thoughtful analyses. Nash's legacy includes making feminist analysis an integral part of the scientific programs of the American Anthropological Association, the Latin American Studies Association, and the Social Science Research Council. She collaborated on international networks with Latin American scholars and feminists. She heads an impressive lineage of women, working-class, and native anthropologists and has been honored with the highest awards of the American Anthropological Association and Latin American Studies Association. The Society of Latin American Anthropologists and the City University of New York's anthropology department named awards in her honor.

Nash's life of field research is marked by two commitments, the first being the community study, in relation to the tensions between local autonomy and predatory capitalism. The second is the return trip and ongoing collaboration, despite increasing danger in certain fields. She has translated and repatriated the vast majority of her work. She revisited field sites in Guatemala, Burma, and Bolivia to present manuscripts for critique and to catch up and join with community members in solidarity. In 2005, Nash wrote that she had never expected to live long enough to witness the great resistance movements of the peoples of her many ethnographies. She wrote (2005) that her hope for the world springs from the periphery, where peasants and workers will find new alliances with which to resist global capitalism.

Nationalism, Transnationalism

Despite anthropology's historical legacy of focusing on relatively small communities and marginal populations, the discipline has long considered the ways in which individuals, groups, and the public draw

identities and construct notions of belonging from the nation-state. This includes the nation-states' intellectual projects that create and perpetuate nationalism—or the sense of attachment, notions of identity, or patriotic emotions derived from the nation-state.

Much of the literature of nationalist studies has assumed that the nation creates primordial attachments. Birth within a particular state, region, community, or ethnic group assumingly binds one to an unyielding geography or collective identity, thereby structuring one's sense of commonality, connection, and nationalistic pride. Yet anthropologists challenge these ideas through grounded ethnographic research focused on diverse experiences among various communities and groups living within and across state boundaries. Research over the past few decades shows that nationalism is neither a neatly organized, centralizing feature within citizens' lives nor a concept that automatically supersedes alternate forms of community, groupings, or identities based on kinship, language, religion, ethnicity, and various other ties. In fact, these diversities often frustrate political elites' and intellectuals' work on national integration and their search for national identities, which in various ways disproportionately favor either those considered autochthonous or those constructed as autochthonous through their ability to exert power over sociopolitical systems within the nation-state. A logical correlate of this line of inquiry is the anthropological attention given to the growing field of transnationalism, which recognizes that political, economic, cultural, and social relationships that increase interconnectivity between people and cultures within multiple nations challenge the boundaries of nation-states and their relevance to peoples' lives. Researchers within transnationalism studies do not assume that the nation-state is the central feature in both citizens' and noncitizens' lives. This recognition forces reconsiderations of the role of boundaries, the ideas of citizenship, and the power of the state in contemporary global reorderings.

Given the growth of global interconnectedness through the expansion of neoliberal capitalism, new communicative technologies, flexible accumulations of labor and capital, transportation advancements, and complex patterns of population movement (including mobilities from labor migration to diasporas or from refugees to environmentally displaced populations), the features of commonality and boundedness that characterize traditional understandings of nation-states become stretched and fragile. In the face of transnational movements, nationalists and some elites marshal political capital and material resources to reinforce the durability of the nation-state and to strengthen nationalistic pride. Yet their efforts only highlight the fact that nation-states do not emerge from shared primordial essences. Over the past 20 years, a majority of researchers within nationalism studies have concluded that nation-states are (re)constructed and historically contingent. Ideas of nationalism and belonging are continuously reimagined and reinvented to mitigate the oppositions posed by global fluidity. As seen in works by authors such as Benedict Anderson, Eric Hobsbawm, and Terence Ranger, ideas of nationalism become rooted within nations and are created through socialization processes, various societal institutions, invented traditions, and "print capitalism."

The Anthropological Focus

Within anthropology, this understanding expands research opportunities. Increasingly, anthropologists focus not only on the roles elites and political institutions play in forming ideas of nationalism but on the ways in which nationalism is performed by ordinary people through everyday practices (see, e.g., the work of Eric Hobsbawm). The study of nationalism "from below" seeks to understand how people understand, reinterpret, and talk about nationalism, as well as experience and reinforce national identities through practice. Here, practice includes common experiences seen in national sporting events, religious activities, or the reification of national symbols. Yet practice also includes sociopolitical divisions that may weaken national solidarities or operate to exclude those considered lesser within national communities. For example, since Thailand's military-led coup d'état of the former prime minister Thaksin Shinawatra in 2006, public discourse has largely framed the political tensions between the "red-shirt/yellow-shirt" protestors as a divergence of rural and urban interests. Popular political rhetoric notably draws distinctions between urban and rural populations, where urban upper- and middle-class citizens are hierarchically associated with modernity, high status, and

education over (lesser) citizens in rural spaces. In the process, the Thai social order is affirmed, and certain citizens receive differential valuations of worth. In such contexts, researchers attend to the mutually constitutive aspects of nationalist agendas and practice. Individuals draw on nationalistic ideologies to structure their behavior and views, as well as justify variants of exclusion or intolerance to those perceived as challenging the stability of the nation-state's social order. Yet still, power of nationalism is exercised over individuals and populations in ongoing attempts to maintain patriotism and solidarity as well as identify instabilities or enemies to a given country. Of course, in the Thailand case, a central problem is how formal and informal powers handle populations within a state that are discursively constructed as other, though they exist simultaneously as citizens. Authors such as James Holston, Aihwa Ong, and Renato Rosaldo have attempted to address such dynamics of engagement and contest among national subjects through the broad field of "cultural citizenship."

These research trajectories have deepened anthropological understanding of the tenuous nature of nationalism and solidarity and have led anthropologists to understand that events within the broad framework of globalization challenge ideas of geographically bounded and unified nation-states. Research in transnationalism highlights the fact that several challenges exist for the actualization of nationalism, as well as the fact that transnational imaginings and processes affect a nation's internal sociopolitical and cultural systems. In particular, much anthropological focus has been directed toward unpacking the multiple layers of transnational practices (including economic, political, social, cultural, and environmental movements across state boundaries), the manifestations of transnational processes at various scales and levels, and the theoretical and methodological developments that grapple with how best to conceptualize and study transnational events and networks.

Largely over the past 20 years—when a flurry of literatures built on or challenged several key works by authors such as Linda Basch, Cristina Blanc-Szanton, Nina Glick-Schiller, Akhil Gupta, James Ferguson, Michael Kearney, and Roger Rouse—transnationalism and transnational theory have been connected with studies on topics including social networks, nongovernmental organizations, transcontinental investment, pan-religious movements, transnational communities, political systems and politicking, identity formation, cultural difference, labor migration, diasporas, and so forth. Contemporary scholarship has applied transnational theory to a host of issues that some argue might more satisfactorily and appropriately be studied within theoretical frameworks such as international theory or even globalization. This results in a decline of conceptual clarity, as the transnational framework is directed toward nearly any process that exists outside the "normative" ideas of bounded nation-states and territorially fixed nationalism.

In response, various works have attempted to bring additional structure to these types of research. At fundamental levels, there have been efforts to draw distinctions between historical analogs of transnational connections and the ways in which the "new" transnationalism differs in form and function. Researchers often recognize parallels between contemporary forms of transnationalism and historical events, such as colonialism, missionary campaigns, empire expansion, or early periods of labor migration and family reunification in the 19th century. However, the scale, intensity, and flexibility of contemporary transnationalism create notable points of divergence from earlier patterns. Specifically, the flexibility of capital and accumulation within transnational corporations, the global extraction and transport of natural resources, the advancements in transportation and communicative technologies, the changing demographic trends of immigrant communities, and the increased percentage of immigrants with higher education and advanced skills all contribute to distinctly new transnational relationships and networks.

Is a Unified Theoretical Approach Needed?

Due to transnationalism's contemporary complexities and its highly diverse expressions in multiple academic fields (e.g., anthropology, economics, geography, philosophy, sociology, etc.), authors argue for a unified theoretical approach. Notably, Sanjeev Khagram and Peggy Levitt, along with associated scholars, have called for *transnational studies* to structure such interests. The transnational studies framework centers on five intellectual foundations: empirical, methodological, theoretical, philosophical, and public transnationalism. While

these foundations call on scholars to clarify how they connect their research to transnationalism (e.g., methodological transnationalism requires that new designs and methods collect data that accurately capture transnational realities), perhaps philosophical transnationalism proves the most transformative. Here, transnational studies continue to critique the assumption that social and cultural life is automatically or principally organized by and contained within nations, states, or other bounded groupings. Yet philosophical transnationalism considers transnational activities the norm and argues that social processes often considered geographically fixed or bordered are affected by *trans*-boundary, *trans*-national dynamics. For example, one might read William Julius Wilson's *When Work Disappears* within a transnational perspective to understand the loss of blue-collar jobs in American inner cities. Transnational studies require researchers to reconsider naturalized, normalized categories that are rooted within the nation-state model of the broader social sciences and to examine the extent and influence of cross-border dynamics.

Such critique and opening of transnationalism's conceptualization are readily seen in the anthropological approach to migration and diasporas, particularly as these populations fundamentally challenge ideas of boundaries, borders, and belonging. For example, scholars such as Deborah Cohen examine the production of transnational subjects, individuals whose self-understanding and connection to place exist beyond the nation-state. As immigrants or members of diasporas transgress national, political, and cultural boundaries, they may recognize themselves as part of multiple national communities, existing as both national and supranational sociopolitical subjects, with multiple allegiances and sources of attachment. Building from research in *social fields*, anthropologists disentangle the ways in which transnational social fields are sustained by interconnected relationships and networks through which ideas, material resources, capital, cultural beliefs, or practices are exchanged across dispersed populations and communities. Much of anthropological research has abandoned assimilationist models that dominated social science research throughout much of the 20th century. Scholars recognize that previously assumed concepts of citizenship or nationalism dramatically change as they are constituted across dispersed geographies.

Intersecting Nationalism and Transnationalism

The emphasis on transnationalism has led anthropologists to explore a wide range of topics, including the formation of transnational political organizations by ethnic diasporas, the way transmigrants critique or support political events within their origin country, the expressions of racism against newly arrived immigrants and how such intolerances operate to sustain transnational lives, the formations of "triadic relationships" among diasporas (i.e., the relationships between the dispersed group, their current state location, and their homeland), the way newly arrived immigrant populations change the sociopolitical structure of urban landscapes and how fear and fixations on citizenship produce new patterns of segregation and exclusion, the emergence of hybridity and new ethnicities among transnational youth, and the shared imagination and consciousness that become reworked as groups or communities move from place to place yet maintain desire and attachment to previous locations (or the reimagination of those locations). Of course, such multiple connections misalign with nationalist views on homogeneity and strict allegiance and patriotism to one nation-state. Immigrant communities, foreign populations, or those deemed nonautochthonous are therefore distrusted and their nationalistic ideologies interrogated. Ultimately, in these intersections between nationalism and transnationalism, researchers may critique the ways in which nation-states are challenged by transnational activities and global fluidity. Yet researchers simultaneously explore how these very actions produce responses that seek to reinforce the validity of the nation-state as well as the associated characteristics of nationalism, autochthony, homogeneity, and boundaries for citizens and noncitizens alike.

Native Anthropology, Native Anthropologist

The English word *native* is derived from the Latin term *nativus*, meaning "innate," "to be born to or related to the land." In colonialist contexts, the root sense of the term was overtaken by a pejorative usage in which *native* was employed to categorize those who were regarded as inferior by the colonial administrators and settlers. Soon, the concept of "native" became associated with the concepts of "primitive" and "savage" in colonial discourse.

There has been a long debate in anthropology over the proper use of the concept of "native anthropologist" and whether it continues the discipline's history of "othering" non-White people. Native anthropologists are believed to write about their own natal cultures from a position of intimate affinity, while nonnative anthropologists, because they are more distant from a culture in which they were not born or raised, are thought to be more "objective" or "objectifying" in their descriptions and analyses of other cultures.

Historical Perspective

Until the late 1960s, anthropology was considered a discipline in which Western scientists studied, interpreted, and represented non-Western "natives."

Beginning at this time, a small number of self-identified "native" or "indigenous" anthropologists, who were members of their own research communities by birth, began to call for the decolonization of anthropology. They suggested that traditional outsider anthropological research be replaced by insider or "native anthropology" formulated from the point of view of indigenous, tribal, peasant, subaltern, and minority researchers who shared a history of colonialism and, thus, subordinate status. In 1988, when Arjun Appadurai critiqued the idea of "the native," he noted that in contrast to the mobile anthropologist, "natives" were persons who not only were from certain out-of-the-way places but were born in and thus belonged to the place the anthropologist was observing or writing about. Not only that, they were also incarcerated or were confined there to their own niches and epistemologies.

This and other telling critiques ought to be understood within the historical context of the professionalization of anthropology. In the 1920s, Bronisław Malinowski described anthropological fieldwork as an encounter between an ethnographic Self and native Others. In his methodological introduction to *Argonauts of the Western Pacific* (1922), Malinowski privileged direct observation and linked it to a radical separation between "home" and the "field." According to his framework, the production of anthropological knowledge depended on observation across a major cultural divide between an ethnographic Self and native Others, who obey the commands of their tribal code without comprehending them. Anthropologists in this tradition—such as Victor Turner and Pierre Bourdieu—believed that their training and their outsider status gave them the ability to understand and unlock native cultural codes.

Boasian historical particularism did not produce "native anthropology" as the virtual Other to "real anthropology" but attempted to overcome Otherness by describing the similarity of peoples

in terms of temporal rather than cultural alterity. Instead of the opposition between an ethnographic Self and a native Other, Boas identified a hidden history as the principal object of study, and he was pleased when Native Americans, African Americans, and members of other cultures generated ethnographic materials. To encourage this, he actively recruited literate informants to produce anthropological texts on their own.

Some native anthropologists wrote their work in their own native languages for local audiences, while others wrote in foreign languages, serving as translators of their cultures for outsiders. This resulted in their segmentation into "indigenous anthropologists," who addressed local audiences, versus "native anthropologists," who addressed international audiences. Two early examples of native anthropologists were Jomo Kenyatta, from Kenya, and Fei Xiaotong, from China. Both were trained in anthropology during the 1930s at the London School of Economics by Malinowski, and they each wrote their PhD dissertations about their own people. Kenyatta wrote and published his 1938 thesis, *Facing Mount Kenya*, in English as both an act of cultural translation and a political defense of the misunderstood indigenous practice of clitoridectomy. Xiaotong undertook his field research in Zaixian'gong, a village not far from where he was born and raised. Instead of writing his 1939 thesis in Chinese, he wrote and later published it in English as *Peasant Life in China*.

That insider or "native" research in one's own society might not be enough of a professional credential for a "non-Western" anthropologist is illustrated by the career of Edward P. Dozier, the first Native American to establish a professional career as an academic anthropologist. From the late 19th century throughout much of the 20th century, American anthropologists who were employed in universities, museums, or government agencies were White male scholars who studied the "vanishing" Indian cultures of North America.

Dozier, the child of an Anglo-American father and a Tewa mother from Santa Clara Pueblo, was both within and outside the Pueblo. This hybrid insider-outsider status enabled him to work during the 1950s and 1960s as both a linguist and an ethnographer within the Tewa society and also outside in the world of professional anthropology. While this was a remarkable accomplishment, his mentor, Fred Egan, mentioned to Dozier that he might further improve his status by working in a foreign culture. He suggested the Kalingas, who once practiced headhunting, as an appropriately "exotic" culture for Dozier's second fieldwork. In 1959–1960, Dozier conducted research among the Kalingas in the Philippines with the aid of a National Science Foundation senior fellowship.

Ever since the emergence of professional anthropology in the late 19th century, it has been a hybrid inquiry, practiced by people of many ethnicities worldwide who worked at recording and translating a vast number of cultural realities. The African American anthropologist Delmos Jones was one of the earliest anthropologists to explicitly raise important theoretical questions about the standpoint, perspective, and positionality of researchers. In his 1970 article "Towards a Native Anthropology," Jones pointed out that while there had been many discussions about the fieldwork problems encountered by "outsiders," there is another, perhaps more important, vantage point from which research might be conducted—that of an "insider," a person who is a member of the same racial, ethnic, or cultural group he or she researches and writes about. He advocated for what he called a "critical native anthropology" that would contribute to the decolonization of anthropology.

Decolonizing Anthropology

Over the years, this work has stimulated Faye Harrison and other anthropologists of color to initiate critical projects in decolonizing anthropology. As they noted, the concept of "native" is problematic since it keeps people in their places by essentializing them, bounding their communities, and subjecting them to the disciplinary legacies of racism, sexism, and homophobia that emerged from colonial rule.

In a 1993 essay, Kirin Narayan argued against the dichotomy between "native" and "nonnative" anthropologists by exploring two intriguing questions: How "native" is a native anthropologist? And how "foreign" is an anthropologist from abroad? She noted that the paradigm separating native anthropologists from real anthropologists stems from the colonial setting in which anthropology was initially forged. Narayan suggested that the concept of the native anthropologist does not serve us well and that we rethink "insiders" and "outsiders" to melt the wall between ourselves as interested readers

of stories and as theory-driven professionals. After all, as subjects simultaneously changed by life experiences and professional concerns, we should write texts mixing narrative with analysis that enacts our hybridity, regardless of our origins. In this way, Narayan emptied of meaning the category of "native anthropologist" by pointing out that no anthropologist is ever really native since he or she inhabits multiple identities that confound and essentialize native status.

The reality is that natives worldwide are rarely homogeneous groups. Even when they share their nationality, there are other, more intimate markers of identity, including regional background, social class, education, gender, sexual identity, and age. For example, the Japanese anthropologist Takami Kuwayama included himself in the "native" category, even though he is a Western-trained intellectual teaching anthropology at a major university in Tokyo. In a critical 2006 review of Kuwayama's book *Native Anthropology*, Harumi Befu, a Japanese American raised in Japan during World War II, questioned Kuwayama's self-identification as a "native anthropologist." He describes "native anthropology" as a practice in which "natives," those people who are normally the objects of ethnographic description—especially those living on the peripheries of the anthropological profession—engage in anthropological discourse.

For Kuwayama, however, nativity is a fluid category encompassing urban ethnographers like himself who are simultaneously considered "nonnative outsiders" by inhabitants of the rural communities where they do their field research and "native insiders" by foreign anthropologists. He extended the concept of native anthropologist to include individuals from any society anywhere who have been objects of anthropological research.

Even the most radical attempts to rethink the concept of "native anthropology" have fallen short of deconstructing the foundational Self/Other divide that organizes fieldwork and produces the native anthropologist as a virtual, or not real, member of the discipline. Kevin Dwyer, in his 1982 book *Moroccan Dialogues*, argued that the anthropologist is more than an outsider; he is a superior outsider who comes from a dominant society and imposes himself on the studied society. As Matti Bunzl noted in 2004, the epistemic division between the ethnographic Self and the native Other has become more, not less, common. Today, many self-identified native, or indigenous, anthropologists agree with him and insist that anthropology must find alternate bases of authority.

Darren Ranco, a member of the Penobscot Indian Nation and a self-identified "native anthropologist," uses his training to advocate for an indigenous perspective and to create new kinds of research that reveal the impacts of research itself on Native communities. He intends his work on the relationship between power and knowledge in Native American environmental policy to be of service to his own as well as other Native communities. In his 2006 article "Toward a Native Anthropology: Hermeneutics, Hunting Stories, and Theorizing From Within," Ranco describes traditional anthropology as a "hunting story"—a narrative about capturing something of the Other that the West desires and bringing it back for Western consumption. He argues that this search for the Other is a colonial desire with which Native and non-Native researchers alike must contend. To replace this colonialist narrative, he suggests that we need to discover what kind of research a community might find interesting and how we can make it into a good anthropological story. He also suggests that we do more participatory research, show our finished products to those we research, and include Native people as codirectors of our projects rather than as mere consultants.

Needham, Rodney

Rodney Needham (1923–2006), a notable figure in British social anthropology, was a theorist and specialist in the study of kinship and the analysis of systems of symbolic classification.

Biography and Major Works

Rodney Needham was born in Welling, Kent, on May 15, 1923. He was educated at Haileybury, a school originally established in 1807 as the East India College. In 1941, he volunteered for the infantry, and the following year he was commissioned into the 4th Battalion, 1st King George V's Own Gurkha Rifles, rising to the rank of captain. He saw service in India and Southeast Asia and was twice wounded in Burma. His time with the Gurkha was of lasting importance; he kept a Gurkha kukri on the wall in his office.

After his discharge from the army, he changed his name from Rodney Philip Green to Rodney Needham, replacing his father's name with his mother's family name.

In 1947, he began a study of Chinese and Malay at the School of Oriental and African Studies, University of London, but the following year, he transferred to Oxford to study social anthropology. He received a Diploma in Anthropology with Distinction in 1949 and a BLitt in 1950, with a thesis on the Naga tribes of the Indo-Burma border. His thesis supervisor was A. R. Radcliffe-Brown. In 1950, prior to his initial fieldwork, he participated in J. P. B. de Josselin de Jong's seminar at Leiden University, which focused on Claude Lévi-Strauss's work. This seminar was formative for Needham. In 1951–1952, he carried out extensive fieldwork with the Penan of central Borneo, and in 1953, he completed his DPhil, with a thesis on the social organization of the Penan. His doctoral supervisor was Louis Dumont. Needham did further brief fieldwork in 1954–1955 among the Kodi and Mamboru in West Sumba and among the Chewong of Malaya.

Needham's first appointment was as a visiting lecturer at the University of Illinois (1955–1956); he then spent the summer of 1956 as an instructor at the University of British Columbia. In 1956, he was appointed as university lecturer in social anthropology at Oxford University, where he remained for the rest of his career. He did, however, have a number of short-term appointments in the United States: at the Center for Advanced Study in Palo Alto (1961–1962), a semester at the University of California, Riverside (1970–1971), a summer session at Harvard (1972), and a year at the University of Virginia (1978–1979). From 1976 until his retirement in 1990, he held the Chair of Social Anthropology at Oxford. He was a fellow of Merton College until his appointment as professor in 1976, when he joined All Souls College. Oxford and its traditions were paramount for Needham; from the time of his appointment until his death, Needham occupied college properties on Holywell Street in the heart of Oxford and within walking distance of the Bodleian Library. He would regularly meet with students for discussions and with visitors, in one or other of the nearby pubs.

Needham was prolific in his writings, which ranged over a great variety of subjects. In addition to his numerous books, articles, and translations, he published more than 200 reviews, notices, letters, communications, and minor translations. He was a frequent reviewer for *The Times Literary Supplement* during the period when all reviews were published anonymously. He was also an inspiring teacher who attracted numerous students. His correspondence with his students and colleagues was voluminous.

Critical Contributions to Anthropology

Although Needham published on his fieldwork among the Penan of Borneo and the Kodi and

Memboru of Sumba, he was better known for a succession of technical analyses of specific systems of prescriptive alliance in diverse societies from around the world. Early in his career, he wrote a succinct monograph, *Structure and Sentiment* (1962), for which he was awarded the Monograph Prize of the American Academy of Arts and Sciences. In this study, he argued the case for the special significance of prescriptive alliance. The monograph was intended to demonstrate the explanatory value of structural analysis versus psychological explanation. He later advanced his ideas on kinship in notable essays in a volume he edited, *Rethinking Kinship and Marriage* (1971), and in *Remarks and Inventions: Skeptical Essays About Kinship* (1974), and he separately articulated his thinking on prescription (1973) and alliance (1986).

Needham saw in societies with prescriptive alliance the possibility for a correspondence of social and symbolic classification. His approach to prescriptive alliance reflected a Leiden tradition that gave emphasis to Durkheim and Mauss's *Primitive Classification* rather than Mauss's *The Gift*, the study that inspired Lévi-Strauss. Ideas of polarity were critical to this understanding. Needham indicated this clearly in his translation of Robert Hertz's essays in *Death and the Right Hand* (with his wife, Claudia Needham, 1960), *Primitive Classification* (Durkheim & Mauss, 1963), and F. A. E van Wouden's *Types of Social Structure in Eastern Indonesia* (1968). Given these different premises and the direction that Needham's researches took, his interpretation of marriage and alliance came to differ significantly from those of Lévi-Strauss. These differences hinged on divergent understandings of ideas of prescription and preference. By relying on precise terminological criteria, Needham attempted to identify a class of societies where marriage relations were directed and obligatory. Thus, within Needham's interpretation, it was possible to distinguish asymmetric preference within a system of symmetric prescriptive alliance. Lévi-Strauss's original formulation was not concerned with these fine distinctions, and it endeavored to encompass a wide spectrum of societies with directed marriage. Needham's approach, in effect, deconstructed Lévi-Strauss's original distinctions and reduced the grand global design of his original work to a more precise analysis of a relatively small group of societies.

Needham translated important works by other thinkers whose ideas resonated with his own. In addition to the works already mentioned, he translated Hans Schärer's *Ngaju Religion* (1963), P. H. Pott's *Yoga and Yantra* (1966), Claude Lévi-Strauss's *Totemism* (1963) and *The Elementary Structures of Kinship* (with J. H. Bell and J. R. von Sturmer, 1969), and Arnold van Gennep's *The Semi-Scholars* (1967). He also translated an article by Marcel Granet and another by A. C. Kruyt for inclusion in his compendium, *Right and Left: Essays on Dual Symbolic Classification* (1973).

Needham also called attention to individuals in anthropology whose work he felt had been neglected. In addition to the studies by Schärer and van Wouden, he prepared a comprehensive bibliography of the writings of A. M. Hocart (1967), produced revised editions of two of Hocart's books, *The Life-Giving Myth* (1970a) and *Kings and Councillors* (1970), and compiled a collection of his essays, *Imagination and Proof* (Needham, 1987). He also promoted the rediscovery of Charles Staniland Wake's *The Development of Marriage and Kinship* (1967) and Carl Nicolai Starcke's *The Primitive Family in Its Origin and Development* (1976).

Needham's book *Belief, Language and Experience* (1972) was a specific demonstration of his conception of anthropology as the practice of an empirical philosophy. His complex, extended argument sets forth the view that belief is not an inner state but a categorical, hence cultural, creation. Following this study, his work increasingly took a philosophical turn. Three thinkers—Sir Thomas Browne, Ludwig Wittgenstein, and Georg Christoph Lichtenberg—were of great importance to him, as was the Argentine writer Jorge Luis Borges.

A succession of volumes consisting of articles and essays on diverse subjects—*Primordial Characters* (1978), *Symbolic Classification* (1979), *Reconnaissances* (1980), *Circumstantial Deliveries* (1981), *Against the Tranquility of Axioms* (1983), *Exemplars* (1985), and *Counterpoints* (1987)—embody some of Needham's most nuanced insights and considered judgments on anthropology and its practice in the widest sense. The thrust of his work was always comparative: Anthropological evidence from the world's ethnographies was the source of his inspiration for the study of what was humanly possible, what might be universal, and how this might be recognized.

Needham articulated his view of social anthropology most emphatically in his Oxford Inaugural Lecture, in which he envisaged an "integrated semantic discipline, an architectonics of significance." Quoting Kant, he proposed a discipline that would chart the limits of human understanding, a venture that would not only be cognitive but would also engage the imagination and the passions. He went on to describe social anthropology in his 1981 book *Circumstantial Deliveries* as "the practice of an empirical philosophy" whose benefits would be

> an expansion of the sympathies, a revision of conventional judgments, the provocation of alternative possibilities of conduct, a vision of man as he might otherwise be, or else a characterization of man as he can newly be seen to be. (p. 28)

Neo-Boasianism

Neo-Boasianism is a late-20th-century revival of the American anthropological tradition founded by Franz Boas (1858–1942). The classic Boasian concerns with culture, history, and psychological patterning are reinterpreted by neo-Boasians in light of recent theoretical trends, especially neo-Marxism, neopragmatism, and practice theory.

Two Networks

The Boasian revival began in the 1980s in two academic networks, one in New York, the other in Chicago. The New York group was loose knit and institutionally dispersed but could be traced by various routes to Columbia University, the original home of Boasian anthropology. A few Columbia alumni, led by Alexander Lesser (1902–1982) and Sidney Mintz (1922–), had never abandoned the Boasian legacy, even as they experimented with materialist and neo-evolutionist approaches widely regarded as antithetical to Boas's school of thought. By the early 1980s, the materialist reaction against Boas had crested, and the basic Boasian sensibilities of these alumni remained intact. The year before his death, Lesser published an important essay that recast Boas as a profound and innovative theoretician whose historical pluralism stood as a bulwark against positivist, reductionist, and teleological thinking. Lesser's interpretation of Boas would be endorsed by Mintz and several other Columbia alumni, including Eric R. Wolf (1923–1999), Herbert S. Lewis (1934–), and Richard G. Fox (1939–). From this rather diffuse network came the first explicit calls for a Boasian revival.

Meanwhile, a more tightly integrated network emerged at the University of Chicago, where George W. Stocking Jr. (1928–) had been engaged since the 1960s in a comprehensive investigation of the history of anthropology. Stocking had been trained at the University of Pennsylvania by Alfred Irving Hallowell (1892–1974), who had studied with Boas in the 1920s. The importance of Stocking's work to the Boasian revival can hardly be overstated. His early essays effectively restored Boas's intellectual reputation after its precipitous decline in the postwar era. Though Stocking never "lobbied" for a neo-Boasian anthropology, he laid its foundation by sharply clarifying the historical sources, conceptual structure, and enduring value of the Boasian legacy. Stocking's many students at Chicago, including Richard Handler (1950–), Ira Bashkow (1962–), and Matti Bunzl (1971–), went on to synthesize his approach to intellectual history with a neo-Boasian style of ethnography and cultural analysis.

While the New York network operated in various "generalizing" modes, with significant forays into evolutionary and Marxian theory, Stocking's circle has been more consistently hermeneutic and

particularizing, with an abiding regard for the viewpoints and experiences of specific cultural actors. This difference in emphasis would seem to recapitulate the old tension between scientific and humanistic orientations that helped define the original Boasian school. The perennial quality of the bifurcation suggests that to reach a deeper understanding of neo-Boasianism, we must reexamine the thinking of Boas himself.

The Original Boasian School

The research tradition that Boas founded around 1900 still dominated American anthropology when he died in 1942. Yet the diversity of approaches within this school has confounded any simple characterization. Indeed, some of Boas's most prominent students, including Alfred L. Kroeber (1876–1960) and Melville J. Herskovits (1895–1963), denied the existence of such a "school," arguing that there was too great a variety of interests, methods, and theoretical orientations among the so-called Boasians to warrant the name.

This image of an intellectual hodgepodge was examined and rejected by Stocking, who recast the Boasians as a diverse and quarrelsome "family" headed by a remarkably steady and rigorous mentor. The historical origins and lifelong consistency of Boas's approach were brought into focus for the first time in Stocking's early essays, as represented in the landmark volume *Race, Culture, and Evolution* (1968). Stocking's subsequent writings, including "The Basic Assumptions of Boasian Anthropology" (1974) and "Ideas and Institutions in American Anthropology" (1976), explored the abiding influence of Boas's legacy in the ramifying projects of his students.

Stocking highlighted a certain theoretical tension at the heart of the Boasian tradition. The alternative principles of "scientific generalization" and "historical understanding" had always coexisted here but were differently weighted by each Boasian theorist. In Boas himself, scientific generalization was a "recessive trait"—masked, in most environments, by a dominant tendency toward historical understanding. Yet the legitimacy of objective, universalizing science as well as interpretive, particularizing history was upheld in Boas's early essay "The Study of Geography" (1887), which has come to be seen as a founding document and veritable manifesto of the Boasian school. In the end, Boas argued, neither science nor history was inherently superior, because each originated in a different desire of the human mind. Speaking for himself and no one else, Boas found the understanding of cultural phenomena within their social and historical contexts simply more satisfying than reducing such phenomena to general laws.

Eclipse and Resurgence

In the middle decades of the 20th century, the Boasian tradition was broadly eclipsed by rival approaches, including the American school of neoevolutionism and European imports such as structural functionalism. These ascendant schools of thought shared a distaste, if not a disdain, for the cultural-historical method in particular. Leading the anti-Boasian movement were Leslie White (1900–1975) and Marvin Harris (1927–2001), who harshly criticized the legacy of "historical particularism" as theoretically vacuous and obsessed with detailed ethnography to the neglect of cross-cultural comparison and explanation. In 1968, Harris produced a polemical history of the field, *The Rise of Anthropological Theory*, which castigated Boas for his purported timidity as a scientist. This was perhaps the nadir of the Boasian tradition.

Yet 1968 also saw the publication of Stocking's first book, *Race, Culture, and Evolution*. For 20 years or more, his sympathetic treatment of the Boasian school would compete with Harris's acerbic critique, effectively dividing American anthropologists into two intellectual "clans" based on rival images of the ancestors. If the tide eventually turned in Stocking's favor, this was attributable not only to the caliber of his scholarship but also to the renewed interest in social and cultural history that swept into anthropology in the 1980s. The rehistoricization of the field drew inspiration from various Marxian, Weberian, and Foucauldian sources, but one option for American anthropologists was to revive and rethink their own 20th-century tradition.

An important harbinger of this trend was "Reconsidering the Ancestors," a yearlong series of lectures held at the City University of New York in 1976. Each of the invited speakers had studied under or worked closely with a leading anthropologist of the Boasian era, and each lecture included personal as well as professional and intellectual reflections. In keeping with the metropolitan setting, the lectures tended to focus on the "ancestors" who had studied

or taught at Columbia and other New York City institutions. Thus, along with Boas himself, Alfred Kroeber, Paul Radin (1883–1959), Ruth Benedict (1887–1948), and Julian Steward (1902–1972) were all profiled and their work debated. The resulting papers, which were edited by Sydel Silverman (1933–) and published under the title *Totems and Teachers* (1981), can be seen in retrospect to carry distinctive traces of neo-Boasianism in its earliest form.

Between Humboldt and Bourdieu

The chapter on Boas was authored by Alexander Lesser, who explored the surprising affinities between Boasian anthropology and Darwinian biology. Like Darwin before him, Boas had turned away from abstract schemes of evolutionary stages in favor of the naturalistic study of variability and interconnectedness within specific social and physical surroundings. In this light, Lesser interpreted both Darwinian biology and Boasian anthropology as *historical* sciences seeking to understand particular events and sequences in ever-changing contexts. Such insight into the Darwin-Boas parallel was rare, especially within anthropology, and very likely rooted in Lesser's undergraduate training: He had studied with the leading pragmatist philosopher John Dewey (1859–1952) before switching to anthropology and taking his PhD under Boas in 1929. Given that Dewey and Boas had converged on a distinctively historicist reading of evolutionary theory, Lesser found himself at a unique intersection in American thought. Here, he was able to gather up conceptual instruments usually assigned to radically different purposes.

The resulting toolkit of evolutionism, pragmatism, and cultural historicism would be sorted through and put to use in various ways by Lesser's own students and followers. First among these was Sidney Mintz, whose introduction to anthropology had come through Lesser's course at Brooklyn College. In Mintz's studies of the Caribbean, traditional culture history was fused with Marxian political economy, giving rise to a neo-Boasian variation on the materialist paradigm that had once threatened to eclipse the Boasian legacy altogether. Mintz's approach was adopted in turn by Richard G. Fox (1939–), who called in 1991 for a "nearly new" culture history based on Boasian models. In taking this step, Fox introduced a certain "paradigm consciousness" into a revival that had been gathering momentum for a decade or more. Herbert S. Lewis (1934–), who was especially attuned to the epistemological sensibilities shared by Boas, Dewey, and Darwin, raised that consciousness to a new level. Lewis set out in the 1990s to extend and elaborate the pragmatism that had been implicit in Lesser's approach. One of Lewis's articles, "Boas, Darwin, Science, and Anthropology" (2001), is perhaps the purest expression to date of neo-Boasianism as a "scientific" enterprise.

Meanwhile, Stocking's students were pushing farther into the historical territory he had first scouted in the 1960s. A neo-Boasian approach, they realized, would have to be based on a broad assessment of the historical revolution in 19th-century thought, with special attention to the German ethnological tradition in which Boas had been trained. Such an assessment was carried out by Matti Bunzl, who argued that Boasian anthropology had deep roots in the German Counter-Enlightenment. In Bunzl's groundbreaking 1996 paper, Boas's intellectual connections were traced back to the dual heritage of Wilhelm von Humboldt (1767–1835) and his brother Alexander (1769–1859). The Boasian culture concept, with its emphasis on historical and especially linguistic relationships, could be traced to Wilhelm, the linguist and philosopher; while the Boasian emphasis on fieldwork and the plotting of distributions in space and time could be traced to Alexander, the explorer and natural scientist. The duality of the Humboldtian tradition, interestingly enough, would be reflected not only in the original Boasian school but also in the twin streams of neo-Boasian thought.

A quarter-century after the New York network staged its lecture series "Reconsidering the Ancestors," Stocking's students offered their own series, "The Pasts, Presents, and Futures of Boasian Anthropology." Presented at the Chicago meeting of the American Anthropological Association in 1999, five of the lectures were published in *American Anthropologist* in 2004. With this newest incarnation of Boasian anthropology, the tradition is not just recovered and revitalized but drawn into dialogue with the works of Michel Foucault, Pierre Bourdieu, and other theorists of late modernity.

Neo-Kantianism

At the end of the 18th century, Immanuel Kant redirected philosophical inquiry from its traditional concern with *being* (ontology) toward the limits and conditions of *knowing* (epistemology). In his three "critiques," Kant asked in order the following questions: What can I know? (*The Critique of Pure Reason*) What must I do? (*The Critique of Practical Reason*) What may I hope? (*The Critique of Judgment*). Each of these questions has been central to anthropology throughout its history: In what measure is knowledge socially or culturally constructed, rather than the result of an isolated subject's encounter with the world? How universal versus culturally specific are the cognitive schemes and value systems that inform and constrain human actions in the world? In what ways does social positioning affect aesthetic judgment? Insofar as anthropology, as a discipline, addresses such questions and reacts to them, it may be regarded as having broadly "neo-Kantian" foundations.

Kant explored these questions in the course of his life chronologically from first to third. However, because the impact of the first question—What can I know?—so permeates the field of anthropology owing to the significance of cultural relativity, the distinctive imprint of Kant and the followers of Kant (or "neo-Kantians") can be most clearly seen by starting with the third critique and working back to the first. The third critique has become focally important in anthropology only in the past 3 or 4 decades, and its impact is correspondingly less widespread.

Pierre Bourdieu

The third critique has been foregrounded most obviously by Pierre Bourdieu in his study *Distinction: A Social Critique of the Judgement of Taste*. Bourdieu responds to Kant's proposal to distinguish between the "agreeable," grounded in the sensation of pleasure, and the "beautiful" and "sublime," which involve judgments distanced from sensation and presumably tapping into a subjective universal. Bourdieu links the Kantian distinction to social class, attempting to show that lower class French judgments regarding taste are more closely tied to the kinds of sensory responses Kant labeled "agreeable," whereas higher social classes tend to make judgments more distant from sensory gratification. More generally, Bourdieu argued that tastes scale according to relative distance from "necessity," higher status aesthetic judgments being more typically "disinterested" and lower status choices reflecting a "taste for the necessary." This work resonates with the much longer history of anthropological interest in the variability of aesthetic standards.

Marshall Sahlins

Although Marshall Sahlins, unlike Bourdieu, does not explicitly mention Kant, his book *Culture and Practical Reason* is widely understood to be a response to the second critique—*The Critique of Practical Reason*—and not only because of the similarity in titles. Kant was concerned in the latter work with the concept of freedom, which is key to his understanding of humanness. By freedom, he meant the ability to act not out of instinct or habit, both of which constrain freedom, but rather in accord with reason. There is an obvious connection between freedom and the disinterestedness of judgment in the third critique, though Kant, here, is concerned not with aesthetic judgments but with the grounds for action, which is also Sahlins's focus. However, Sahlins argues for a view of action as grounded not in universal reason but rather in cultural schemes.

In effect, the cultural or "symbolic scheme" replaces reason as the a priori.

Max Weber

The huge shadow cast by Kant over the social sciences often goes unremarked because, unlike Bourdieu and more like Sahlins, most scholars never mention him explicitly, instead regarding his thought as a background to their own foregrounded ideas. Concerning the second critique, this is nowhere more obvious than in the case of Max Weber, whose idea of "interpretive analysis" so influenced Geertz and much of contemporary cultural anthropology. Weber conceptualized social action in a way that strikingly parallels the grounds of action posited by Kant, for whom freedom meant acting in accord with reason as opposed to emotion or habit. For Weber, reason appears as the "rational" form of social action, as opposed to "affectual" (i.e., determined by the actor's feelings) and "traditional" (i.e., determined by habit). Indeed, he viewed the large-scale transformations of human society in terms of a movement from tradition to rationality mediated by affect (or "charisma"). Despite the obvious background debt to Kant's second critique, the 1,469 pages in the English translation of Weber's monumental *Economy and Society: An Outline of Interpretive Sociology* contain no direct mention of Kant and only one reference to neo-Kantian doctrines.

This is not to suggest that Weber was straightforwardly affirming the views laid out in the second critique. He was not, in any simple fashion. In fact, his rationality is not the same as Kant's reason. In the case of social action, Weber distinguished two types of rationality, what he called "value-rationality" and "instrumental rationality." The former—where an action can be seen as fostering a particular explicit value—most closely parallels Kant's notion of reason. It is congruent with Kant's argument regarding the categorical imperative, which involves acting in a way that the actor would wish everyone to act in accord with the same principle. Weber distinguished this value orientation from the instrumental form of rationality, where rationality refers to taking account of how other human beings as well as objects in the environment actually behave. Conduct could be rational in the first sense if doing Action A would foster Value B, but it would be irrational if in doing A the actor did not take account of how others would respond to A. Correspondingly, an action could be rational in the second sense of calculating environmental responses but may not be oriented to fostering ultimate values or goals.

Importantly, Weber socialized the notion of reason. For Kant, reason was transcendent, with ethical imperatives following from its dictates. For Weber, ultimate values were part of social formations, especially religions, in which he was so intensely interested. In some ways, for Weber, it was the instrumental form of rationality, particularly as manifested in the economic realm, that embodied the horizon of human history and that came closest to a human universal. In contrast to Kant's hope for the future, Weber held a decidedly more pessimistic view, summed up in his phrase "the iron cage," referring to the deathly grip instrumental rationality holds on human life as economic action proliferates.

Émile Durkheim

If the second critique has been hugely influential in the social sciences, it is nevertheless probably the first critique—*The Critique of Pure Reason*—that has most supplied the backdrop for research within anthropology historically. In this critique, Kant distinguished the "phenomenal," what is accessible in the world through the senses, from the "noumenal," what must be supposed to lie behind the phenomenal, things as they are as opposed to things as they are perceived. He also adopted a distinction between *a priori* and *a posteriori* knowledge, that is between knowledge arising from experience and knowledge that precedes experience and makes experience possible. A priori knowledge was, in this way, transcendental.

Perhaps the most influential anthropological work to take up the Kantian distinctions was Émile Durkheim's *Elementary Forms of the Religious Life*. Durkheim, however, provided a very different understanding of the a priori. He argued that transcendent knowledge comes to us from society or what we today call culture. Kant, according to Durkheim, viewed human existence as involving the interaction between an individual subject and a material world. The material world was revealed to the subject through sensory perceptions, but the subject was also guided by impersonal reason,

which is prior to and also necessary for experience. Durkheim proposed that Kant erred in failing to appreciate "collective thought" and "collective representations," what we would today call "culture." While Durkheim made explicit reference to Aristotle's "categories of understanding"—that is, ideas of space, time, class, number, cause, substance, and person—he had in mind as well the Kantian categories. As he did in his earlier work with Marcel Mauss, *Primitive Classification*, Durkheim argued further that a priori conceptions of space and time derive from society and social classifications.

Where Kant imagined transcendent universal conditions behind subjective experience, Durkheim posited social or cultural conditions that are prior to the experience of any given individual and that inform the experiences of that individual. In so doing, he set the stage for much of later anthropological investigation by raising the question of possible cultural variability. That the categories of experience may derive from society does not necessarily exclude the possibility that there are some aspects of those social categories that are universal. However, it does suggest that we cannot immediately move from the recognition of a priori knowledge to human universality. Cross-cultural study would have to be a part of any such investigation.

Franz Boas

If Durkheim introduced Kantian epistemological considerations into the emerging discipline of anthropology, so too did Franz Boas in the United States. George Stocking notes that, as a young man, Boas was influenced by Benno Erdmann, one of the leading Kantian scholars of his time. Boas wanted to explore the relationship between the subjective and objective worlds. Culture would for him come to play a central role, as it did for Durkheim, intervening between experience and understanding. Stocking speculated that even E. B. Tylor, author of the 1871 book *Primitive Culture*—regarded by many as the first work in English to use the term *culture* in something like its modern anthropological sense—may have been influenced by Kant. Whether or not he was, there is evidence that Boas developed American anthropology at least in part in response to Kantian ideas, and especially Kant's first critique.

Later Developments: Sapir, Jakobson, and Foucault

It is interesting to view some later developments in this light, for example, the discovery by Boas's student Edward Sapir, published in his article "The Psychological Reality of Phonemes," of the influence of phonemic patterning on the ability to cognize differences between sounds. Phonemic structure appears to intervene between perception or experience and its meaningful comprehension. Moreover, the phonemic system is the product of a given specific language, and systems vary from one language to the next.

The work of the Prague School linguist Roman Jakobson in splitting the phoneme—the minimal meaningful unit of sound within language—into its constituent binary features in turn provided a way to approach Kantian universal a priori foundations at the level of sound—although there is no evidence that Jakobson was actually thinking about the Kantian dualism. Jakobson's approach to sound in turn supplied a model for Claude Lévi-Strauss's quest to uncover the binary oppositions of myth in his three-volume *Mythologiques* series and, hence, to arrive at something like Kantian universal prerequisites of experience, or what Lévi-Strauss called "brain structure."

Tensions between the quest for universals and the assertion of cultural variability run throughout the history of anthropology and in some ways situate anthropology as a discipline responding to the thought of Kant—and even, perhaps, as a "neo-Kantian" discipline. Even Michel Foucault, who had such an influence on anthropology in the latter part of the 20th century and the beginning of the 21st, himself responded to Kant. As part of his 1961 dissertation, Foucault wrote "Introduction to Kant's Anthropology," which critically assessed Kant's 1798 book, *Anthropology From a Pragmatic Point of View*, a collection of the lectures Kant gave every year between 1772 and his retirement in 1796 in a course on anthropology.

Kant's 1798 book is often thought to be a starting point for the discipline of anthropology as it is known today. It raises what can be regarded as a fourth Kantian question, supplementing those underlying the three critiques. The fourth question is "What is man?" Or, as it might be put today, what

is a human being? Foucault, in his "Introduction," challenged the coherence of Kant's approach, suggesting a contradiction underlying it. In the three critiques, Kant's subject is pure, existing outside time; it is not empirical. The pure subject possesses a priori characteristics, such as the categories, that make experience possible. But in this 1798 work, Foucault points out, Kant makes the subject into an object. The subject, as formulated in the first three critiques, becomes in this last rendering simultaneously an object of empirical investigation. Foucault thought of this as an unresolvable paradox. Lévi-Strauss, however, regarded this not as a paradox but as the defining characteristic of the method of ethnography. He referred to anthropology as a science that used intimate experience (what we would today call "participant observation" research) to establish objective accounts of culture and society.

Anthropology: A Neo-Kantian Discipline?

There are good reasons to regard many of anthropology's key aspects as responding to Kant's formulations, not only those of the three critiques but those founding his "anthropology" as well. At the same time, one could look at the discipline from other perspectives, for example, through Marxism, which, though relatable back to Kantianism through its Hegelian reworking, became far enough removed from the Kantian project to give a different perspective on the field. Foucault himself took inspiration from Nietzsche, who, though reacting in many ways to the neo-Kantian environment in which he was immersed, ended up sufficiently far from Kantian questions to suggest yet another angle on the discipline. Or, again, one could look at anthropology through the lens of semiotics, as conceived by Charles Sanders Peirce and carried forward first by Roman Jakobson and more recently by Michael Silverstein and others. Peirce's semiotics was an attempt to rethink Kant's categories, but the rethinking was so innovative as to give yet another perspective on the discipline.

Still, there is benefit derived from employing Kantian thought as a lens through which to view the coherence of anthropology as a discipline. The human-subject-as-empirical-object problem remains with us today, and as Lévi-Strauss proposed, it is a defining characteristic of the anthropological endeavor. Moreover, just as Kant viewed the human subject as endowed with the capacities for freedom and reason, and the ability to use those capacities to render experience intelligible and to guide action, so too has anthropology viewed humans as having a special capacity, an exceptionally developed orientation to the transmission and acquisition of culture, enabling them to organize conduct and lend meaning to experience in terms of it. While research has shown how widespread social learning is in the animal kingdom—and so, in certain respects, how widespread "culture," as broadly construed, is—humans continue to be unique with regard to the extent to which sensory experience is rendered intelligible and conduct is regulated by something prior to the experience of any given individual: the culture into which that individual is born and continues to live.

Network Theory/Social Network Analysis

A social network is a set of entities (often referred to as *actors* or *nodes*) and the set of ties that represent a designated type of relationship among them. The social network approach is rooted in the assumption that the structure of social relationships among a collection of nodes has important consequences. The pattern of relationships in which a node is embedded can enable or constrain its behavior, thereby affecting the outcomes attainable by that node.

Social Networks in Anthropology

Although it wasn't the first social science discipline to employ the social network approach, anthropology has played an important role in the development of social network analysis (SNA) as a field. Indeed, the term *social network* was coined by the social anthropologist John A. Barnes in 1954. SNA has been used to study a number of topics in anthropology. As social anthropologists began doing fieldwork in urban contexts in the 1950s and 1960s, they used social network thinking to make sense of the greater social complexity they faced. SNA proved useful in the study of kinship systems as well, as it provided anthropologists with a formal set of mathematical tools with which to examine kin networks. Cognitive anthropologists have also taken a social network perspective by, for example, examining the effects that certain social network positions have on individual perceptions. Moreover, many anthropologists have found that the formal network approach to examining social interaction is an effective complement to ethnographic fieldwork. In the following sections, we describe the basic underpinnings of social network theory and the methodological aspects of data collection in SNA.

Social Network Theory

One criticism of social network research is that it is devoid of native theory. A number of scholars have recently countered this contention by outlining the theoretical contributions that have grown out of social network research. We briefly summarize these key theoretical concepts below.

Types of Ties and Levels of Analysis

Entities studied in social networks include individuals, clans, villages, organizations, nations, or any other entity that is capable of having some kind of relationship with another entity. The ties that connect nodes in a network can also come in many forms. For example, ties that have been studied in anthropological research include kin relationships among family members, friendship ties among individuals, gift exchange ties among households, alliances ties among tribes, and economic exchange ties among villages. The types of ties studied in SNA can be classified into five general categories. The typology depicted in Table 1 contains five types of dyadic relationships: similarities, social relations, mental relations, interactions and transactions, and flows.

Network ties are often thought to form "paths" or "pipes" along which resources (e.g., information, beliefs, money) flow. Social networks can be examined from three levels of analysis: the node level, the dyadic level, and the network level. At the *node level*, researchers focus on where each individual node is located in the overall structure of the network. One of the best known node-level concepts is centrality, which is a family of concepts that describe node position. At the *dyadic level*, researchers focus on the properties of pairs of actors. Examples of dyadic measures are *geodesic distance* (i.e., the number of links in the shortest path from one node to the other) and *structural equivalence* (i.e., the extent to which a pair of nodes has, or does not have, ties to the same third parties). At the *network level*, researchers focus on the structure of the network as a whole. Examples of network-level properties include *density* (i.e., the proportion of the number of ties that actually

Table 1 Typology of Social Network Relationships

Types of Relationships	*Examples*
Similarities	
• Location	Nodes in the same spatial and temporal space
• Membership	Nodes in the same tribe; nodes in the same club
• Attribute	Nodes of the same gender; nodes with the same beliefs
Social relations	
• Kinship	Mother; grandparent; sibling
• Non-kin relationship	Friend; enemy; coworker
Mental relations	
• Affective	Likes; hates
• Cognitive	Knows; sees as competent; believes to be high-status
Interactions and transactions flows	Talked to; had sex with; lent money to; traded with Information; beliefs; money

Source: Borgatti and Ofem (2010). Reprinted with kind permission of Harvard Education Press.

exist out of the maximum number of ties that could mathematically exist) and *centralization* (i.e., the extent to which the network revolves around a single node).

Social Capital

One of the most important theoretical concepts to come out of social network thinking is that of social capital, which can be defined as the benefits of network connectedness. Social capital is seen as a determinant of the success of individuals or collective entities. It contrasts with and complements a human capital point of view that sees outcomes of entities as a function of the inherent characteristics of the entity. At the individual level, the social capital perspective argues that actors can use their social ties to access or control resources—such as information or financial capital—that they don't possess themselves. At the group level, social capital theorists argue that certain overall network characteristics (e.g., density) provide a collectivity with a cohesiveness that enables it to effectively pursue collective goals. Thus, there are two fundamental social capital perspectives, with one focused on how networks facilitate individual action and the other focused on how networks facilitate collective action.

Theoretical Mechanisms

The primary focus of social network research in the social sciences has been on the outcomes that networks generate. These outcomes can be divided into two categories: homogeneity and performance. *Homogeneity* refers to the similarity of nodes in terms of their behavior or internal structure. A study that examines how two actors come to have the same beliefs about child rearing would be an example of research focused on homogeneity. *Performance* refers to a node's outcomes with respect to some good. A study that links social network centrality to economic wealth would be an example of research focused on performance. Three theoretical mechanisms for explaining homogeneity and performance have been identified: direct transmission, adaptation, and binding.

Direct transmission occurs between nodes when there is either (a) a physical transfer of a material resource or (b) a mimetic process of contagion whereby an intangible resource (e.g., an idea) is transferred. For example, one actor influencing another actor to adopt a certain set of beliefs by having a face-to-face discussion would be an example of homogeneity being created via direct transmission. The direct transmission mechanism can also be used to explain performance outcomes, as when an actor taps her more experienced friends for advice.

Adaptation provides another explanation of how nodes become homogeneous. Adaptation occurs when nodes react to their social environments; a consequence is that if two nodes have similar social environments, they are similarly shaped by those environments. For example, two nodes tied to the same third-party nodes at work (e.g., the same boss, same suppliers, and same customers) will likely exhibit the same behaviors because they are exposed to the same demands, requests, and constraints by virtue of being tied to the same third parties.

The idea behind the *binding* mechanism is that social ties can bind nodes together to create a superordinate identity, creating coordinated action on the part of its constituents. Labor unions and political alliances illustrate the binding mechanism in that they both provide individual nodes with a new identity based on the collective, not to mention greater levels of power than any one node could have in isolation. The power that nodes derive from binding processes enables performance. The superordinate identity that nodes assume through binding enables homogeneity.

SNA Methodology

SNA requires specialized data-gathering methods to capture the relationships among entities. There are two primary data collection strategies used by social network researchers. The first is the *whole-network approach*, which entails measuring all of the relationships that exist among a predefined set of nodes. The second is the *egocentric* approach (also known as a personal network research design), which entails selecting a sample of nodes from among a population and then gathering data about the characteristics of their personal social network ties.

Whole-Network Approach

In the whole-network approach, a set of nodes is predetermined by the researcher before data collection begins. The population of nodes chosen often corresponds to some kind of group; it may be a self-defined group or it may be a group that is defined by the researcher. In this approach, the researcher attempts to get every node in the population to report on his or her ties with every other member of the population. For example, each individual in an organization might be asked to list every other organization member with whom the individual (a) has a friendship tie to, (b) has a conflict tie to, or (c) seeks advice from. In this case, the network population is all the members of the organization and three types of network ties are being measured.

This approach results in a number of person-by-person matrices (known as *adjacency matrices*) that represent the presence or absence of each kind of tie between each possible pair of individuals in the network. These matrices are usually composed of 1s (which indicate the presence of a tie) and 0s (which indicate the absence of a tie), although this is not always the case. Each adjacency matrix represents one particular type of tie, so the example mentioned above would result in three adjacency matrices, one each for friendship, conflict, and advice.

One drawback of the whole-network approach is that a substantial proportion of the population needs to respond for the network data to be valid. The most agreed-up rule of thumb states that a researcher needs a 75% to 80% response rate to conduct a valid analysis of a whole network. The primary benefit of whole-network data, however, is that it allows a researcher to compute a number of graph-theoretic measures and matrix algebra procedures that are not possible with egocentric data.

A second drawback is that, to construct the network, surveys cannot be anonymous. This can reduce response rates when respondents have concerns that the data will not be kept confidential.

Egocentric Approach

In the egocentric approach, a researcher begins by selecting a sample of respondents out of a population. The goal in egocentric analyses is not to capture all of the ties that exist among a group of nodes (known as *egos*), as in the whole-network approach. Instead, the idea here is to take a representative sample from a large population and then gather data on the personal networks of each ego. The process of gathering data on each ego's network happens in two steps. In the first step, the researcher asks each ego to respond to *name generator questions*. The purpose of name generator questions is to get the ego to generate a comprehensive list of others (known as *alters*) in his or her social network. An example of a name generator question is "With whom do you discuss important personal matters?" The answers to name generator questions generate a list of the ego's alters.

The list generated in step one then feeds into the second step, which is the *name interpreter*. In this

step, the ego is asked about the types of relational ties he or she has with each of the alters named. For example, an ego might be asked to indicate which of the alters on the list he or she considers to be a friend, which are family members, which are coworkers, and so on. These data provide a researcher with information on the size of the ego's network. The ego may also be asked to answer questions about the characteristics of each alter. For example, the ego may be asked to indicate the age, gender, and race of each alter on the list. These data allow the researcher to determine the composition of the ego's social network. In some studies, the ego is also asked to indicate whether or not each of the alters has social network ties with the others. This provides the researcher with data on the structure of the ego's social network.

The principal benefit of the egocentric approach is that it can be conducted on a random sample of nodes and that it is not subject to the response rate requirements inherent to the whole-network approach. The data collected via this approach are also not subject to the network autocorrelation issues encountered with whole-network data, which means that these data can be treated as normal attribute variables and can be analyzed using the same methods as for traditional social science data. A third benefit of the egocentric approach is that the surveys can be anonymous and even the alters need not be identified by their real names.

The principal drawback of the egocentric approach is that it does not capture the structural features of an entire network, which means that certain social network measures cannot be applied to data collected with this approach.

Conclusion

Social network theory and methodology continues to play an important role in anthropological research. Anthropologists are currently using social network perspectives to examine a number of phenomena. In biological anthropology, researchers are using SNA to study the evolution of primate social structure to better understand human cooperation (for a review, see Lewton, 2012). In cultural anthropology, H. Russell Bernard and colleagues continue to pursue their "network scale-up" project, which provides tools for estimating hard-to-count populations. Douglas White and Ulla Johansen have recently provided the field with new, network-based, conceptual tools for understanding kinship. Anthropologists Jose Luis Molina and Christopher McCarty have been studying migration from a network perspective and developing new tools for egocentric network research in the process. These are but a few examples of the ways in which researchers are using social networks in anthropology. Many exciting directions, however, remain for social network researchers to pursue.

Nineteenth-Century Evolutionary Anthropology

The concept of evolution served as a framework by means of which scholars could describe physical,

cultural, and social change. It was a key principle in the discussions of early anthropologists. This was particularly true in Great Britain but also—though to a lesser extent—in other countries where anthropology took hold as a new field of inquiry in the mid-19th century.

Evolution and Anthropology

The field of anthropology grew out of a number of areas of inquiry, including linguistics (then called philology), biology, anatomy, geography, and history. These varied disciplines shared a common interest in the character of world's peoples and in perceived contrasts in their physical appearance and levels of social and technological "advancement"—concepts typically subsumed under terms such as "race," "culture," and "civilization."

Anthropology's first forum in Great Britain was the Ethnological Society of London, founded in 1843 as an offshoot of the Quaker-dominated Aborigines' Protection Society. There were similar societies in Paris and New York and an earlier Anthropological Society of London, in existence from 1837 to 1842 as well as a second Anthropological Society established for a short time in the 1860s. For many members of these organizations, the concept of "evolution" provided a unifying theory to explain the differences among peoples—a means by which to place non-Europeans within a single continuum, extending from "simple" to "complex" and "primitive" to "civilized."

Western Concepts of Evolution

Evolution was a concept employed in "natural history" or "natural philosophy" long before the emergence of various branches of science in the 19th century. Many natural philosophers had hypothesized about the nature of plants and animals and their relations to one another. Evolutionary ideas were also current in historical thought and in speculations on the nature of human societies—long, indeed, before Darwin. The very notion of hierarchy and a relationship between "low" and "high" forms was in fact endemic in Western thought, extending back to ancient philosophers and to the theological concepts of the Middle Ages.

Contributions of Natural Philosophers

The medieval notion of a "great chain of being" was a central theme in Western thought, coloring much of the later speculation on the world's order. Enlightenment philosophers added a new level of understanding to the physical world and the interrelationships among its many parts. The French philosopher René Descartes (1596–1650) employed a mechanical model to describe change and variety among plants and animals. Other philosophers, notably Gottfried Wilhelm Leibniz (1646–1716) and Johann Gottfried Herder (1744–1803), had a more spiritual concept of evolution. The mid-18th-century writer Pierre Louis Maupertius (1698–1759) took a more "materialist" stance, arguing that changes among species, including humans, were the result of accumulated variations—a concept that anticipated Darwin's central concept of "natural selection."

In the late 18th century, Georges-Louis Leclerc, Comte de Buffon (1707–1788) postulated a unity among species, suggesting that many species had common ancestors. Buffon's ideas expressed in his books *Natural History* (*Histoire naturelle, générale et particulière*, published in 36 volumes between 1749 and 1788) and *Epochs of Nature* (*Les époques de la nature*, 1778) had an important influence on later thinkers, shifting attention away from the notion of divine creation toward a more "scientific" conception of origin and change. The encyclopédiste Denis Diderot (1713–1784) argued as well for the transmutation of species. Jean-Baptiste Lamarck (1744–1829) provided a theory for the mechanism of change, arguing that species passed on acquired characteristics to their offspring. Concurrently, the English philosopher James Burnett, Lord Monboddo (1714–1799), speculated that humans were subject to the same principles and that modern races may well have descended from primates.

Historians and Social Philosophers

Ideas of gradual change and transformation were important not only to "natural philosophers" but to social philosophers as well. The Scottish writers Adam Ferguson (1723–1816), John Millar (1735–1801), and Adam Smith (1723–1790)—all members of the Scottish Enlightenment—suggested that societies went through relatively uniform stages from hunting-and-gathering societies, through pastoralism and nomadism, to agriculture and then commerce. The influential German idealist Georg Wilhelm Friedrich Hegel (1770–1831) also believed that history had an underlying rationality and

directionality. Historical change, in Hegel's view, elevated humankind to higher states of existence. Although Hegel had little direct influence on anthropological thinking, his notions of change, teleology, and progress corresponded to notions of evolution adopted by later anthropologists.

Nineteenth-century writers built on this early work. Among the most important of these was Auguste Comte (1798–1857), now considered to be among the principal founders of the modern discipline of sociology. In his influential work *A General View of Positivism*, first published in 1848 and translated into English in 1865, Comte synthesized his ideas on "social evolution," positing three distinct stages of development—from theological to metaphysical to positive. In Comte's view, the varied beliefs and practices of existing peoples corresponded to one of these stages.

The English writer Herbert Spencer (1820–1903) similarly applied the general idea of "evolution" to human societies. Spencer wrote of evolution as early as the mid-1850s. He later coined the phrase "survival of the fittest" in response to Darwin's concept of "unconscious selection," giving the concept of evolution a more strongly aggressive character than it had in Darwin's writings. Spencer's own ideas of evolution drew as well on those of Jean-Baptiste Lamarck, suggesting that societies changed over time in response to necessity and that the resultant changes passed on to future generations. Although not a leading figure in the new anthropological organizations, Spencer knew many of the anthropologists of his generation and contributed importantly to the emerging anthropological discourse.

Uniformitarian Geology

The concept of "gradual change," as expressed in uniformitarian geology, had an enormous impact on anthropological thought in the mid- to late 19th century. So too did the geological recognition of layers in the earth's crust, each representing distinct epochs in the world's evolution. Geology also provided anthropologists—as did the science of biology—a model for scientific organization and discussion.

Formulated by early Scottish geologists such as James Hutton (1726–1797) and John Playfair (1748–1819), the idea of uniformitarianism was given further prominence in the early 19th century by "practical geologists" such as William Smith (1769–1839). All of these early scientists argued for a "gradualist" understanding of the earth's change and variation, suggesting that earlier "catastrophist" explanations, in large part predicated by biblical teaching, did not adequately account for the variety of rocks and sediments evident from stratigraphic cuts in the earth's surface. The presence of fossilized forms of extinct animals further verified that much longer periods of time had been necessary than those proposed by theologians for the earth's creation and subsequent changes.

The leading figure in the field of geology in the mid-19th century was Charles Lyell (1797–1875). Lyell stressed the importance of understanding development in universal terms, an idea easily grafted onto anthropological thinking of the time. His emphasis on the value of an understanding of stratigraphy as a record of geological change provided a ready metaphor for anthropologists interested in understanding the development of human societies. A close friend of Darwin—and of many anthropologists as well—Lyell expressed sympathy to the idea of "transmutation of species" as early as the 1830s and later expressed strong support for Darwin's *Origin of Species* after its publication in 1859.

Ethnologists and Evolution

The concept of evolution played a key role in the understanding of early "ethnologists"—the predecessors to later anthropologists—especially the leadership of the Ethnological Society of London. The anatomist and "phrenologist" Robert Dunn (1799–1877) saw parallels between the development of human anatomy and social organization, arguing for a single human origin and varied degrees of "improvement" toward civilization among the world's different races. His ideas were explained in his long treatise "Civilisation and Cerebral Development," published in the society's *Transactions* and in other works. Thomas Hodgkin (1798–1866) and Richard King (ca. 1811–1876) also perceived a unity among humans, suggesting that the environment played an important role in humanity's varied appearance and unequal achievements.

James Cowles Prichard (1786–1848), one of the Ethnological Society's founders, developed these arguments further, proposing five-part division of humankind based on physical character and technological and social "advancement." His *Researches*

Into the Physical History of Mankind—first published in two volumes in 1813 and expanded in many subsequent editions—argued that humans transcended their circumstances to move on to higher levels. Prichard's work specifically opposed the theories of the German philosopher Johann Friedrich Blumenbach (1752–1840), who held that each of the world's several races occupied permanent positions. Blumenbach's arguments, in turn, found continuing favor among opposition figures in the new field, including members of the short-lived, breakaway Anthropological Society of London (the second society with this name), founded in 1863.

In his *Natural History of Man*, published in 1843, Prichard argued for the unity of human origins, citing language as an identifying characteristic of human groups. He also utilized his studies of ancient languages to demonstrate specific connects among peoples, suggesting that human varieties were the equivalent of the branches of a single tree. Not exactly an evolutionist position—his concept emphasized historical change and was based on the twin notions of dispersal and migration—it shared with the concept of evolution an emphasis on "gradualness" and "interrelatedness."

Parallels in Archaeology

Probably the closest field to anthropology in the mid-19th century was archaeology. As with anthropologists, archaeologists aspired toward greater scientific acceptance in the mid-19th century and witnessed the creation of numerous new societies.

One of the great contributions of archaeology was the "Three-Age System," a method of classification of artifacts proposed by the Danish antiquarian Christian Jurgensen Thomsen (1788–1865) in the 1830s. Based on collections of tools and weapons, Thomsen placed objects in a sequence of stone, bronze, and iron. Thomsen's system offered a means of dating objects relative to each other and also of assessing the relative level of advancement of peoples both in the past and in the present. Thomsen's system became shorthand for archaeologists and the lay public, allowing for the categorization of peoples based on the types of tools used. Implicit in the Three-Age System was the assumption that peoples could pass from one state to another, like the ancient Europeans, from whom the model was derived.

In Great Britain, the archaeologist John Lubbock (1834–1913) was the first to elaborate on Thomsen's system. In 1865, Lubbock published what scholars have called the most important archaeological book of the 19th century, titled *Pre-Historic Times*. This work not only introduced the concept of "before history" but also suggested important relationships between people in the past and those of the present. As his book's subtitle explained, his work showed how "ancient remains" were illustrated by "the manners and customs of modern savages." Lubbock invented the terms *Paleolithic* and *Neolithic* to further subdivide Thomsen's "Stone Age."

The Impact of Darwin

Charles Darwin (1809–1882) often is credited with originating the concept of evolution for anthropologists of his era. Darwin's explanation for variations among species and, more important, the transmutation of species—meaning a change from one distinct type of plant or animal to another—had a great impact on all thinking people of the time. However, the idea of evolution had multiple sources, as we have seen, and early anthropologists borrowed freely from these when formulating their own theories.

Darwin's most striking new idea was what he saw as the mechanism by which change was effected: This was Darwin's concept of "unconscious selection," in which he argued that species changed as a result of minute adaptations over time due to competition. Darwin's idea represented a distinct advance over other explanations of change, providing a new way of understanding adaptation. Darwin's thesis also opened the door to new ways of interpreting humanity's origins and diversity.

One of Darwin's great collaborators and supporters was the British naturalist and explorer Alfred Wallace (1823–1913). Wallace independently developed a theory to explain the transmutation of species. Unlike Darwin, Wallace stressed environmental pressures on the species as a whole and not on individuals. Wallace also perceived a greater gap between apes and humans than Darwin had implied. Active in anthropological societies of the 1860s, Wallace, in fact, provided a harsh vision of completion among species that in fact gained little acceptance among anthropologists, who still tended toward a more benign understanding of social change than that set out in the vision of either Wallace or Darwin.

Darwin's greatest champion among active anthropologists was Thomas Henry Huxley (1825–1895). In 1863, he anticipated Darwin's later work the *Descent of Man* (1871) with his own publication *Evidence as to Man's Place in Nature*. Huxley was one of the founders of the Anthropological Institute of Great Britain and Ireland (later the Royal Anthropological Institute) in 1871. Although he wrestled with many of Darwin's ideas, he eventually accepted the fundamental notion of "gradualism" but remained skeptical of Darwin's central concept of natural selection.

Evolutionist Orthodoxy

The principal advocate for a new theory of "cultural evolution" was the Quaker anthropologist Edward Burnett Tylor (1832–1917). A friend of the archaeologist Henry Christy (1810–1865), Tylor's interest in human variety originated in his 2-year trip to Mexico, an experience that became the basis of his first book *Anahuac: Or Mexico and the Mexicans, Ancient and Modern* (1861). His question in *Anahuac* was whether the ancient Aztecs developed independently or were indebted to other civilizations. His answer was that the native people of the New World evolved separately from the people of Europe and the Middle East and that they did this independently. He repeated this argument in his books *Researches Into the Early History of Mankind and the Development of Civilization* (1865) and *Primitive Culture* (1871).

Tylor's views found wide acceptance within the anthropological community and among the public more generally. His ideas on social and cultural evolution became a liberal orthodoxy, coloring British attitudes toward native peoples and clearly affecting colonial policy in the late 19th century. The idea that humans adapt to circumstances and their environments in a universal manner and that all societies are capable of slow transformation from "primitive" conditions to "civilized" ones became a canon of the new discipline as it came to be defined in Great Britain. Other British anthropologists adhered to a similar theoretical position. These included Augustus Pitt Rivers (1827–1900), the founder of the museum in Oxford still bearing his name, and James George Frazer (1854–1941). Pitt Rivers's collection mirrored Tylor's theories, demonstrating the progress of human technology. Frazer's comparative studies of religion and symbolism similarly adhered to Tylor's essentially "unilineal" evolutionist ideas.

Although Tylor accepted the concept of borrowing or "diffusion" of knowledge, he tended to emphasize processes of independent development. In contrast to this largely British version of anthropology, Continental scientists—typically far more rooted to philology and geography—preferred explanations couched in terms of cultural influences. Often contrasted with "evolutionism," "diffusionism" promoted the idea that there were specific sites of origin for many aspects of culture, downplaying the evolutionist notion of universal responses to similar conditions. Diffusionism had its strongest adherents in Germany and in Scandinavian countries. It later found support in the United States, especially through the influence of the German scholar Franz Boas (1858–1942). Both approaches were not necessarily mutually exclusive. However, the champions of either approach tended to find deep faults with the ideas and suppositions of their rivals. They also distrusted the broader implications of each other's theoretical framework.

One of the last great contributors to the 19th-century idea of "evolution" was the American lawyer and ethnographer Lewis Henry Morgan (1818–1881). Active in the American Association for the Advancement of Science—and the organization's president in 1879—Morgan published widely on the Iroquois nation as well as on geology, stone implements, kinship systems, and various species of animals, notably the beaver. His 1877 work *Ancient Society* contained the most complete explanation of his notion of human evolution through separate distinguishable and—in many ways—universal stages. Morgan's work was well received by his British colleagues and had a profound impact on the writings of Karl Marx and Friedrich Engels (1820–1895) as well.

Ortner, Sherry

Sherry B. Ortner (1941–) has been one of the outstanding contributors to anthropological theory since her debut article in 1972. Her contributions lie in several overlapping areas—culture, gender, and practice theory, as well as issues of class and culture in late capitalism—with an overall concern to develop an approach to practice that integrates history, power, and meaning. Her arguments are developed in several outstanding ethnographic monographs as well as several edited works, but her forte, perhaps, has been the essay. She has an unusual ability to move right to the heart of major theoretical issues and to depict the alternatives and developments with great precision and clarity.

Ortner was trained at Bryn Mawr (BA in 1962) and the University of Chicago, receiving her PhD in 1970 in the heyday of symbolic anthropology, of which Chicago was the center. She has had a distinguished professional career, teaching at Sarah Lawrence, Michigan, and Columbia, among other places, and serving as department chair at both Michigan and Columbia. She is currently Distinguished Professor of Anthropology at University of California, Los Angeles. She has held a MacArthur fellowship and been a recipient of numerous other awards, fellowships, and honorary lectureships.

Ortner has carried out several fieldwork projects among the Sherpas of Nepal, resulting in three theoretically informed and noteworthy ethnographies, on (1) popular religion and the interpretation of rituals, (2) the causes and consequences of the founding of Buddhist monasteries in the early 20th century, and (3) the perceptions of mountaineering expeditions by Sherpa guides and their employers. The latter, *Life and Death on Mount Everest*, won the Staley Prize in 2004. Ortner then turned her attention to the United States, with a project on her former high school graduating cohort on issues of social class, followed by research on the relationship between independent filmmaking and mainstream Hollywood. Between these projects, she also produced a series of important and provocative essays on gender and practice.

Culture, Practice, and Gender

Many of Ortner's ideas emerged through interaction with her teacher Clifford Geertz. Thus, in the early essay "On Key Symbols," her distinction between summarizing and elaborating symbols articulates two approaches to the depiction of culture and to the work that symbolic formations do that expand and develop Geertz's concepts of models of and models for. Her concept of key scenarios has been especially influential and presages her subsequent conceptualizations of serious games and projects. More generally, her work is informed by and elegantly develops what she calls in her 1997 article "The Fate of 'Culture': Geertz and Beyond," a fundamentally Geertzian view of human social life: meaning laden, meaning making, intense, and real.

As a consequence of her participation in feminism (theoretically and lived), and no doubt influenced by the interdisciplinary environment at

Michigan, Ortner took a turn away from a fully Geertzian position by the mid-1980s, as heralded in her incisive stock taking of the field, "Theory in Anthropology Since the Sixties." This remains a tour de force account of the various theoretical positions that characterized a highly creative, transformative, and disputatious period of approximately 2 decades. There is no better short guide to the strengths and weakness of the main theories of the day and the ways in which they challenged, influenced, or ignored each other. The essay also brought together a number of theoretical initiatives under the label "practice" and set out one influential image of the critical features of a practice approach.

Although he pointed the way to a form of practice theory, Geertz famously read practices as though they were cultural texts that could be abstracted from live action. Ortner looked for a more "muscular" and less static approach than the Geertzian interpretive approach, one that could account for power as well as meaning and would examine the interests of (and constraints on) actors engaged in pursuing specific practices, the social consequences of such practices, the conflicts entailed in the process, and, more generally, the ways in which agents can respond to the culture or structures that form them. Following her own specifications, Ortner's subsequent work provided a more fully sustained and historically located account of practice in social life. However, unlike many Marxists and practice theorists, she never ignored the importance of culture, interpretation, or thick description and has carefully addressed "the fate of 'culture'" and the legacy of Geertz, as well as acknowledging the changing conceptualizations of culture.

Thus, Ortner draws on Geertz to understand gender as a "cultural system." The implications are, first, that it is not directly natural and, second, that what women and men do and who they are need to be understood through the particular set of meanings that define gender constructs and polarities in the first place. But she moves beyond this framework to look at what the actions and motivations of specific socially located agents are, a position that would not be antithetical to Geertz's and for which, as she acknowledges, he laid the groundwork. Culture, as Ortner (1997) comes to formulate it, "is not an aesthetic object but the grounds of action and the stakes of action, with real outcomes in the real world and with powerful representations in literature, drama and art" (p. 10). In a later essay, Ortner (2006) distinguishes poststructuralist concerns with delineating subjects or subject positions from a more deeply and culturally informed account of *subjectivities*, which she defines as "complex structures of thought, feeling, and reflection that make social beings always more than the occupants of particular positions and the holders of particular identities" (p. 115).

Among cultural anthropologists, Ortner stands out for her lively interest and evident success in applying the work of the great social theorists (Karl Marx, Max Weber, Émile Durkheim, and Sigmund Freud, as well as more recent figures like Pierre Bourdieu and Raymond Williams). In her case, the key figures have been especially Weber and, subsequently, Marx, albeit the latter at arm's length—influences interestingly tempered by inspiration from Jean-Paul Sartre. In thinking through the deep roots of gender, she briefly addressed Freud and also took a foray into the work of Claude Lévi-Strauss, producing a very important, highly controversial, and largely misunderstood essay, "Is Female to Male as Nature Is to Culture?" The essay was also strongly indebted to Simone de Beauvoir (who may have been something of an intellectual role model). Like de Beauvoir, Ortner stands out by bringing the insights of feminist theory to bear on mainstream "high" theory (and conversely) and hence exhibits in her own practice, as a heavy hitter in a field then dominated largely by men, the relationship of agency to structure.

Although some critics have seen that essay as, in effect, naturalizing gender or acceding to the inevitability of gender hierarchy, that was far from Ortner's point, and indeed the dominant orientation of her work in this respect has been, in a broad sense, Weberian. The 1981 edited book *Sexual Meanings* was precisely about cultural variation in the meaning of gender and sexual difference, and Ortner's own essay offers a deep analysis of the particularities of gender in hierarchical Polynesian societies. In the original "Is Female to Male" article, Ortner bluntly claimed that the secondary status of woman in society was a true universal, a claim that she subsequently partially retracted or at least complicated in interesting ways. She also clarified that conceptualizing gender through a nature/culture opposition could not directly produce inequality. However, in her 1996 volume of essays *Making Gender: The Politics and Erotics of Culture*, she continues to

assert the point that such oppositions, understood (as they must be) at a deep level as existential quandaries rather than as empirical terminologies, generate metaphors that are often asymmetrical.

Agency, Subjectivity, and Class Projects

As *Making Gender* clearly illustrates, Ortner is interested in the complex relations between subject formation and agency, the ways in which human subjects simultaneously find themselves "made" by specific cultural, ideological, or discursive formations and "makers" who can engage their circumstances and resist them. She argues in the introduction for a practice theory that transcends not only the alternatives of structure and agency but also a way of thinking that begins with seeing structure and agency as opposed terms within a dichotomous relationship. Although she does not reference them, in some ways, her articulation of the gendered "games" she sees people playing, with respect to marriage strategies and the like, echoes the work of Bronisław Malinowski and Marcel Mauss on the circulation of value.

Ortner suggested that what she labeled practice theory was not really a theory in the usual sense of the word but rather an argument about how human action and structure dialectically make and unmake each other. She called it a project to conceptualize and represent social life, the latter understood in terms drawn from Sartre with respect to subjectivity and objectivity in unity and constant motion (1996; citing Sartre, 1968, p. 97). For Ortner, as noted, this entails giving a central place to agency. In a relatively late essay, published in 2006, she defends the concept of agency against the critique that it is individualistic, culturally particular, and naive in its explanation of change. She articulates two dimensions of agency, understood as a form of intentionality and the enactment of "projects," often with unanticipated consequences, and understood as a form of power, including acts of empowerment, domination, and resistance. While some theorists might privilege only one of these, she shows that they are inextricably interconnected.

While a book like *High Religion*, which takes up the cultural shape and movement of historical agency, beautifully exemplifies Ortner's theoretical project, by the 1990s, Ortner shifted her gaze from Himalayan Buddhism to the contemporary United States, where her ethnographic projects are remarkably consistent with, shaped by and enhancing, her theoretical vision. These ambitious, brilliantly conceived projects (characterized in each case by exhaustive original fieldwork, carried out by Ortner, not a team of students) provide a two-pronged account of class and the production of culture in the contemporary United States. *New Jersey Dreaming* is about "class" in a double sense—it is an ethnography of her own high school graduating class as a historical cohort, but it is also about class mobility and discourse in the United States. Class in the second sense in Ortner's hands is not merely a sociological variable (or a precise Marxist analytic) but, after Bourdieu, a habitus and, after Sartre, a project. In *Not Hollywood*, she turns to cultural production in the independent film industry to show agentive responses to the disruptions created by decades of neoliberal policy, economic decline, and class polarization experienced by the generation of the middle-class adult children of the New Jersey study. Interestingly, although this is the most directly Marxist of her books, her methodology here includes a return to a Geertzian interpretation of "texts" with respect to the films and the interviews with filmmakers she observed. *Not Hollywood* is a singular intervention that brings together the strengths and insights of cultural studies, understandings of "public culture," and good old-fashioned ethnography to produce a work simultaneously of and on culture critique. If the proof of anthropological theorizing lies in the quality of the social and cultural analysis it generates, and is responsive to, this work, like the Sherpa trilogy, brilliantly validates Ortner's contributions.

Oxford University

Although an interest in anthropology at Oxford can be traced back to the 1860s, its institutionalization dates from the founding of the Pitt Rivers Museum in 1884. That same year, Edward Tylor, a key figure in 19th-century evolutionary anthropology in Britain, was given a readership, later promoted to a professorship. However, he had little impact on teaching, and it was Robert Ranulph Marett, an evolutionist of a later generation, and Henry Balfour, the first curator of the Pitt Rivers Museum, who dominated social and cultural anthropology in Oxford from the launch of the first postgraduate course in anthropology in 1905 until A. R. Radcliffe-Brown's appointment as professor of social anthropology in 1936. This continued focus on evolutionism ensured that Oxford remained behind the times compared with the London School of Economics, where Bronisław Malinowski's functionalism was attracting the more progressive minds in the discipline.

Oxford anthropology did not start to catch up with other anthropology departments until Radcliffe-Brown arrived. He was a leading structural-functionalist, famous for treating anthropology as the science of society, through which it was possible to discover laws as in the natural sciences (see *Structure and Function in Primitive Society*, 1952). However, anthropology still remained a very small subject, with only seven students in Radcliffe-Brown's year of retirement. His efforts to set up an undergraduate degree in the subject were unsuccessful. It was not until the inclusion of anthropology in the new Human Sciences degree course in 1969 (followed by the launch of the Archaeology and Anthropology programs in 1990) that a degree in anthropology was offered at Oxford.

E. E. Evans-Pritchard, who succeeded Radcliffe-Brown as professor of anthropology at Oxford in 1946, resembled him in acknowledging the influence of the Durkheim school (he also sponsored many translations of its members' works) but differed in seeing anthropology not as a science but as closer to history.

Evans-Pritchard's most famous work, *The Nuer*, published in 1940, is perhaps the archetypal structural-functionalist ethnography, basically a demonstration of the political dynamics of the Nuer's descent and territorial systems. The Nuer, of the Sudan, had no central political authority and were therefore acephalous ("headless"). They did have mediators, in the form of so-called leopard-skin chiefs (really priests), with little actual power beyond the threat of their curses. Much discussed, one main lesson of this study was the way in which social groups are not fixed but take different forms according to the context. Evans-Pritchard also set out to show that, contrary to colonial stereotypes, Nuer feuding was not just senseless violence but had a structure of what he called "ordered anarchy."

Evans-Pritchard also wrote on religion and family and marriage among the Nuer. However, his other major ethnography was on the Azande (*Witchcraft, Oracles and Magic Among the Azande*, 1937) of the borderlands between the Sudan, Uganda, and what is now the Central African Republic. This famous study of witchcraft was again mainly concerned to counter colonial stereotypes, this time by showing that these beliefs were not simply mindless superstition but had a logic to them. Evans-Pritchard also showed that witchcraft is not a substitute for causal explanations of the physical world but explains coincidences, rather like the western notion of luck

(which the Azande lack). This study was therefore also a tacit refutation of the view that primitive peoples have fundamentally different mentalities—more mystical, less logical—from those of civilized humanity, associated with the French philosopher Lucien Lévy-Bruhl. Evans-Pritchard showed that the Azande are no less logical than Westerners, who in their turn are no more logical than the Azande in ordinary life.

Later in his career, Evans-Pritchard wrote extensively on other anthropologists and those he saw as their precursors among philosophers, such as the Scottish Enlightenment thinkers of the late 18th century. His writings can also be read as exemplifying what it means to do fieldwork, at which he was a master, far more so than Radcliffe-Brown. And he started a trend in skepticism of theory and about the limitations of anthropology (e.g., the idea that some topics are best left to the psychologist or theologian), which continued through the later work of both Rodney Needham and Edwin Ardener, two of his successors at Oxford, and in some ways has come to characterize anthropology at Oxford—another departure from the functionalist dogmas of Radcliffe-Brown. This is perhaps best seen in his short *Theories of Primitive Religion*, published in 1965. Under Evans-Pritchard's tenure of the professorship, the anthropology department at Oxford expanded considerably, being given five teaching posts in addition to his professorship and having more than 100 students.

Anthropologists at Oxford have historically had a focus on work in Africa and the subcontinent of Asia. Personally close to Evans-Pritchard was Godfrey Lienhardt, who wrote a renowned phenomenological study of the religion of the Dinka (*Divinity and Experience*, 1961), a neighboring tribe to the Nuer, whom the latter often raided and enslaved. One of Evans-Pritchard's last students, Wendy James, appointed a lecturer in 1972 but now retired, has conducted extensive and long-term work with another Sudanese people, the Uduk. Others who taught anthropology at Oxford under Evans-Pritchard were Meyer Fortes, Max Gluckman, Mary Douglas, Paul Bohannan, John Peristiany, and John Beattie (all Africanists); Peter Lienhardt (the Persian Gulf); M. N. Srinivas, Ravi Jain, Louis Dumont, and David Pocock (all Indianists); Franz Steiner; Rodney Needham; and Edwin Ardener. At the Pitt Rivers Museum at this time were, among others, Audrey Butt and Kenelm Burridge.

On Evans-Pritchard's retirement, the China specialist Maurice Freedman succeeded him for 4 years, an uneventful period for Oxford anthropology both intellectually and institutionally. A year after Freedman's premature death in 1975, Rodney Needham, a structuralist, replaced him as chair of the institute and professor, though after differences with his colleagues, he left the institute and based himself at his college (All Souls). Although he later disagreed with Claude Lévi-Strauss, Needham is especially known for his structuralist analyses, and his imprint on Oxford anthropology has been extensive. Needham worked extensively on kinship from a structuralist point of view, rejecting psychological explanations for kinship systems in *Structure and Sentiment* (1962) and solving many technical issues. He published his own fieldwork on kinship in eastern Indonesia comparatively late in his career. Partly through his work on kinship, he also became interested in classification, a topic he saw as central to anthropology. One of Needham's best known works is *Belief, Language and Experience* (1972), in which he deconstructs the notion of belief as either a cross-cultural category or an inner state. Needham was also active as a translator and editor of obscure but worthy earlier anthropologists. He retired in 1990 and died in 2006.

Three of Needham's students held posts in Oxford from the 1970s (all retired or due to retire as of 2011): Peter Rivière (fieldwork among the Trio in the Amazon), N. J. Allen (fieldwork among the Thulung Rai in Nepal), and R. H. Barnes (fieldwork in Kédang in eastern Indonesia). All can be considered structuralists broadly influenced by Needham, and all have (inter alia) worked on kinship and contributed to the historiography of the subject. Allen has also sought to take further the work of Georges Dumézil on Indo-European comparative mythology.

Another influential figure at Oxford of roughly the same period was Edwin Ardener, whose influence matched Needham's in his lifetime, though they were personally estranged (Ardener died in post in 1987). He did fieldwork in both West Africa and the Hebrides but never took a doctorate. Like Needham, he was interested in problems of classification as well as structuralism. With his students, he began to criticize and deconstruct Claude Lévi-Strauss's ideas, partly with reference to other French intellectual currents of the time. His main approach to classification, unlike Needham's, concerned not its structure

but rather its language and its meanings and how they differ from culture to culture. This led to a brief fashion for "semantic anthropology" at Oxford in the early 1980s. Ardener also pointed to the way in which new categories are created in the very process of classifying. For example, new ethnic, caste, and other labels were often devised by European officials in taking censuses in colonial territories, labels that had not existed before in the indigenous scheme of classification (though they would be adopted later). Thus, there was no boundary between data collection and classification: They were a "simultaneity." Other ideas of his included the template (really a structure) and "event density" (the idea that different periods, or different societies, seem more eventful than others). With his wife, Shirley Ardener, he pioneered the study of women, which, fostered especially by Shirley, has been a consistent feature of Oxford anthropology since about 1970, though institutionally separate from the department. Under Edwin's auspices, the *Journal of the Anthropological Society of Oxford* was founded in 1970.

Needham's three successors as chair from 1990 have been John Davis (fieldwork in Libya and Italy; also promoted the use of computers in anthropology and oversaw the founding of the British Centre for Durkheimian Studies by William Pickering); David Parkin (fieldwork with the Giriama of East Africa), from 1996; and the current holder, David Gellner (fieldwork among the Newar, etc., in Nepal), from 2008. Parkin's tenure saw the launch of the Centre on Migration Policy and Society as a research center for migration studies (directors: first Steven Vertovec, now Michael Keith) and the establishment of medical anthropology, under the custodianship of Elisabeth Hsu, a specialist in traditional Chinese medicine. She was later joined by Stanley Ulijaszek, a specialist in human ecology, whose work is located at the interface of the social and biological aspects of medicine. Parkin's tenure also saw the creation of a second chair, currently held by Harvey Whitehouse, whose work combines the study of religion and cognition. Still more posts (mostly lectureships) have been created under Gellner.

There has also been a revival of biological anthropology under another recently appointed professor, Robin Dunbar, whose "number"—suggesting a limit of around 150 as the number of acquaintances humans can cope with cognitively—has become media famous. Although physical or biological anthropology has been represented at Oxford since becoming a supplementary subject in the Natural Sciences degree course in 1885, its first reader was not appointed until 1927, and it only became a separate department (later institute) in 1976 under Geoffrey Harrison (supported by Vernon Reynolds) and then under Ryk Ward. The untimely death of the latter in 2003 led to a hiatus in its activities until it was revived in 2006.

Another fairly recent development is visual anthropology, started by Marcus Banks (a specialist in India on Jains) in the 1990s. In museum-related studies and material culture, the current specialists are Inge Daniels (Japan); Michael O'Hanlon (Director of the Pitt Rivers Museum and a specialist on New Guinea); Clare Harris (Tibet, art) and Laura Peers (northwest North America, repatriation issues), the latter two having curatorial roles at the Pitt Rivers Museum as well as teaching duties; and Jeremy Coote (Sudan). Their immediate predecessors at the museum were two successive directors, Brian Cranstone (New Guinea) and Schuyler Jones (Nuristan), Donald Tayler (Colombian Amerindians), and Howard Morphy (Australia).

Other permanent and teaching members of staff include Paul Dresch (Yemen, Middle East), Elizabeth Ewart (Lowland South America), Morgan Clarke (Lebanon, Middle East), David Pratten and Ramon Sarró (Africanists), and Robert Parkin (Indian tribes, Poland, and kinship). Roger Goodman (Japan), Laura Rival (Lowland South America, development), Mohammad Talib (Islamic societies), Fernanda Pirie (anthropology of law), and Sondra Hausner (Nepal) are anthropologists with permanent posts in other departments but having close connections with the institute. At the time of writing (2011), anthropology at Oxford has around 200 graduate students in a typical year (twice as many as in Evans-Pritchard's day), split roughly equally between taught master's degrees and doctorates, plus around 50 undergraduates.

Parsons, Elsie C.

Elsie Clews Parsons (1974–1941) was a prominent American feminist, sociologist, anthropologist, and folklorist. She first specialized in critiques of gender and family life in Western society but later focused on Pueblo Indian, Zapotec Indian, and Afro-Caribbean culture. She was central to the development of American anthropology in the interwar period, serving as president of the American Folklore Society (1918–1920), the American Ethnological Society (1923–1925), and the American Anthropological Association (1940–1941). She underwrote the *Journal of American Folklore*, serving for many years as its assistant editor. Today, she is not only known as a pioneering feminist anthropologist but is also known for the intrusiveness of her research among the Pueblo peoples of the American Southwest.

Early Life

Born in 1874 into a prominent New York family, Elsie Worthington Clews rebelled against the restrictions of her gender and social class at an early age. As an undergraduate at the newly established Barnard College, Elsie found in sociology the basis for a critique of the cultural beliefs underlying women's subordination. Within 3 years of receiving her BA (in 1896), she obtained an MA in sociology and a PhD in education from Columbia University. In 1900, she married Herbert Parsons, a lawyer and fellow social reformer, and 2 years later, she became a lecturer in sociology at Barnard, teaching on the organization of the family. She gave up the position in 1905 when Herbert was elected as a Republican Congressman, and the family moved to Washington, D.C. There, she completed a controversial textbook, *The Family: An Ethnographical and Historical Outline* (1906), the first of six books that employed comparative ethnological material to critique contemporary social classifications based on sex, age, race, and nationality.

In 1910, Parsons made a visit to the American Southwest that turned her interest toward anthropology. Like many nonconformists of her generation, Parsons found a sense of new possibilities in the Southwest. While seemingly a radical departure from her sociological work, Parsons' new interest in Pueblo Indian culture stemmed from her interest in discovering alternative ways of organizing gender relations and family life.

Ethnographic Research in the Southwest

On returning to the east, Parsons soon moved back to New York, where she immersed herself in the ethnological literature on the Southwest and acquainted herself with both the Native American collections and the curators of the American Museum of Natural History. Among the curators were Pliny Goddard and Robert Lowie, who introduced her to the empiricism of Franz Boas. She soon came into contact with Boas himself and with Alfred Kroeber—both of whom became close friends and colleagues. In 1915, after two additional short trips to the Southwest, Parsons plunged into fieldwork in Zuni, presenting a paper titled "Zuñi Pregnancy and Conception Beliefs" that same year. The following

year, she published the first half dozen of some 90 professional articles on the Pueblos and her last sociological book, *Social Rule: A Study of the Will to Power*. The book concluded that science offers an escape from the restrictions and intolerance of conventional social classifications.

Between 1916 and 1932, Parsons made brief field trips to most of the Western and Rio Grande Pueblos. While at Zuni, she stayed at the home of Margaret Lewis, as did Kroeber before her. Mrs. Lewis, a Cherokee, originally came to Zuni as a schoolteacher; she was married to a prominent Zuni man, who served as governor of the *pueblo* from 1912 to 1917. Much of Parsons's understanding of the Zunis was mediated through Margaret Lewis, who was paid for her assistance. Parsons' *Notes on Zuñi* (1917) includes a diary of events that Parsons solicited from Lewis, and her magnum opus, *Pueblo Indian Religion* (1936), contains materials from Lewis, a Hopi Tewa man named Crow-wing, and Alexander M. Stephen, a Scotsman who married a Hopi and lived in his wife's village in the early 1880s. Parsons is now recognized as an innovator in the use of personal documents in ethnographic accounts.

Parsons's lifelong interest in the relationship between cultural conventions and individual experiences, together with her desire to influence public opinion, led to a second innovation in ethnographic form: a 1919 fictional biography, "Waiyautitsa," that traces the life of a typical Zuni woman from cradleboard to grave. After its publication, Parsons persuaded Boas, Kroeber, Lowie, Leslie Spier, Paul Radin, Edward Sapir, and other anthropologists to write similar fictional pieces, which she gathered, together with a revised "Waiyautitsa," into a popular collection, *American Indian Life* (1922), lavishly illustrated by her friend Grant LaFarge. In the introduction to the collection, Parsons identifies herself as a "Member of the Hopi Tribe," basing this designation on the formal hair-washing and name-bestowing ceremony given her by a Hopi host in the hope that clan membership would mitigate others' opposition to her presence. By all accounts, the adoption meant a lot to Parsons, although she, like her host, thought of the ceremony instrumentally, hoping that it would help her obtain entrance to ceremonies closed to non-Hopis. Perhaps, she used her adoption in an equally instrumental way in *American Indian Life*, seeking to appeal to an audience that, as she wrote in her preface, usually got their ideas about Indians from romantic novels.

Partly because of restrictions on her movements and observations, partly because of her concern for individual expression and variation, and partly because of her thoroughgoing empiricism, Parsons' ethnographic studies are polyphonic and situated, meshing together her own observations, those of other scholars, and native texts (in English); generalizations, speculations, and examples of individual deviations from custom; and assessments of both informants' accuracy and the limitations of her own knowledge. As a comparative survey and summation of a life's work, *Pueblo Indian Religion* is inevitably couched in a more impersonal and authoritative voice than many of Parsons's other writings. Even here, however, she is by no means an invisible or omniscient narrator. She draws widely on the work of others, makes frequent use of anecdotes, admits the incompleteness of her knowledge, and ties her own material to particular informants, indicating through the latter practice that even this broad-sweeping synthesis is dependent on a research method that typically relied, in each town, on one or two key informants—often, like Margaret Lewis and Crow-wing, an outsider of some kind.

In contrast to the Western Pueblos, where she lived in the Zuni governor's house and was adopted into a Hopi clan, Parsons's research in the more secretive Rio Grande Pueblos was generally clandestine. She would typically interview single informants outside the *pueblo*, employing an interpreter related to the informant and paying both to reveal sensitive or privileged religious knowledge or objects. Parsons was aware of the questionable ethics of this research method and its potential for personal and social devastation. She knew that trespassing in the area of shrines, except by those ritually empowered to do so, was an act of desecration and that religious ceremonies lost their power if revealed. Her informants told her that they would be jailed or killed for revealing privileged knowledge, that they feared bringing illness or a difficult pregnancy on themselves, or that they felt compelled to confess their betrayal before dying.

At Taos, Jemez, San Juan, and elsewhere, the publication of Parsons's monographs prompted animosity toward and reprisals against those believed to have betrayed their people. Trying to prevent this—and viewing her work as primarily for the consumption of other anthropologists—Parsons

attempted to conceal the identity of many of her informants in publications and to keep all her works from being distributed outside the scholarly circles in the Southwest. While she voiced regret over the consequences of the dissemination of her manuscripts in the *pueblos*—particularly at Taos, where her friends Tony and Mabel Dodge Luhan were targets of hostility—she continued to justify her scholarship in terms of her scientific commitment to documenting a way of life that she thought was disintegrating—a belief she shared with Boas and other members of his circle. In the end, Parsons's research method—which was adopted by her protégé Leslie White and others—exacerbated factionalism among the Pueblos, reinforced secrecy, and increased suspicion of anthropologists and other outsiders. Parsons's sense of Western science's entitlement to Pueblo religious knowledge continues to this day to cast a shadow on her oeuvre on the Pueblos.

As exploitative as were her relationships with many of her informants, Parsons was dedicated to egalitarian collaboration among scholars. In 1918, soon after initiating her own research in the Southwest, Parsons founded the Southwest Society, an organization that until her death in 1941 supported and coordinated ethnological fieldwork and the publication of research results—including dozens of volumes with expensive color plates. Under the auspices of the Southwest Society, Parsons supported the work of Boas, White, Ruth Benedict, Ruth Bunzel, and Esther Goldfrank on the Pueblos and that of Gladys Reichard, Ruth Underhill, Berard Haile, and Morris Opler among other Southwestern peoples. Outside the Southwest, Parsons was a strong supporter of the work of Melville Herskovits.

On at least two occasions, Parsons's social and institutional prominence allowed her to be of genuine service to the Pueblos. When the U.S. Senate's passage of the Bursum Bill in 1922 threatened Pueblo land tenure and water rights, Parsons contacted friends in Congress and the press; organized resolutions on behalf of the Pueblos from the Peabody Museum, the American Ethnological Society, and the American Anthropological Association; helped form the Eastern Association of Indian Affairs, a non-Indian advocacy group; and organized publicity for a Pueblo delegation to Washington. When this threat passed, Parsons turned her attention to opposing an executive order of Indian Commissioner Charles H. Burke that prohibited summer religious ceremonies in the *pueblos* on the grounds that they took up time better spent in agricultural labor. The opposition to Burke, like that to Bursum, was successful and ultimately led to the appointment of John Collier, a reformer active in both struggles, to head the Bureau of Indian Affairs under Franklin Roosevelt. Nevertheless, at the time she wrote *Pueblo Indian Religion*, Parsons was convinced that Pueblo religious life was not only changing but disintegrating under the twin assaults of Protestantism and capitalism. She advocated urgent research efforts on that basis—without, however, acknowledging that intense research by outsiders might, in fact, actively contribute to religious disintegration through heightening factionalism and secrecy. Fortunately, Parsons and her contemporaries have been proven wrong in their estimation that the Pueblos and their ceremonial life would soon become extinct. There has been a renaissance in Pueblo religion that has included both a revitalization of ceremonial life and a renewed control over sacred knowledge, sites, and objects.

Research in Mexico and the Caribbean

While Parsons's research among the Pueblos was the most sustained, stretching across her entire career as an anthropologist, she also completed significant folkloristic research on Afro-Caribbean culture as well as extensive field research in Mexico. Her acclaimed 1936 ethnography, *Mitla: Town of the Souls*, is an acculturation study of the Zapotecs of Oaxaca, which grew out of her interest in the Spanish influence on the Pueblos. Based on three seasons of intensive field research in Mitla, it stands with Robert Redfield's *Tepotzlan* as an important ethnography of her time. *Mitla* pioneered the use of modernist techniques in ethnographic writing and also called attention to similarities in the indigenous cultures of Mexico and the American Southwest.

Parsons, Talcott

Talcott Parsons (1902–1979) is the preeminent American theorist in sociology and, worldwide, the most important sociologist of the mid-20th century. His work mediates between the contributions of late-19th-century and early-20th-century figures, such as Max Weber, Émile Durkheim, and George Herbert Mead, and the more specialized writings of recent sociologists. Parsons's "general theory of action," developed over 50 years, was designed to be universal, applicable to all aspects of human conduct in all times and places. Parsons's theory evolved through several distinct phases, with its central ideas gaining increasingly abstract, analytical, generalized, and yet carefully qualified formulation.

Background and Career

Parsons was raised in a Congregationalist family that maintained a New England ethic of, in Max Weber's phrase, inner-worldly asceticism. At Amherst College, he studied institutional economics, Darwinian biology, and Kantian philosophy. He then spent his first year of graduate study at the London School of Economics, where Bronisław Malinowski's seminar in anthropology was his outstanding intellectual experience. In that seminar, he became friendly with three fellow students who later became major figures in the development of the British school of social anthropology, E. E. Evans-Pritchard, Meyer Fortes, and Raymond Firth. Parsons later kept in intermittent touch with them, read their major works, and tracked the progress of their thought. In the following year, Parsons studied at the University of Heidelberg, where he was inspired, as he later wrote, by the "ghost" of Max Weber. Weber had died several years earlier, but his thought still influenced teaching at the university. Parsons found in *The Protestant Ethic and the Spirit of Capitalism* a striking analysis of the religious ethic of his own upbringing. That analysis led him to Weber's comparative studies of ancient and non-Western civilizations, then the methodological essays, and, further, the study of Neo-Kantian thought. Parsons later completed his doctorate at Heidelberg with a dissertation on the conception of modern capitalism in the works of Weber and other German economic historians. With his dissertation drafted in 1927, he became an instructor in economics at Harvard University. With the founding of the Department of Sociology at Harvard in 1930, he transferred to it. Promotions came slowly due to opposition from the new department chair, Pitirim Sorokin, but by the end of World War II, Parsons had become professor and succeeded Sorokin as chair.

In the postwar years, Parsons collaborated with the anthropologist Clyde Kluckhohn, the social psychologist Gordon Allport, and the clinical psychologist Henry A. Murray in founding the interdisciplinary Department of Social Relations. He served as its first chair and taught both graduates and undergraduates. In 1969, the Department of Social Relations was dissolved, despite Parsons's opposition, and sociology again became an autonomous department. Parsons retired in 1973, but he retained an office, continued to write, and taught at other universities.

Parsons's seminars on "Topics in the Theory of Social Systems" were famous as forums in which he worked out new ideas and engaged graduate students in developing theory. His teaching for undergraduates was generally too demanding to be popular, yet his lectures gave students a sense of being brought directly to the frontiers of sociological theory. His graduate students included the sociologists Robert K. Merton, Bernard Barber, Marion Levy, Harold Garfinkel, Robert N. Bellah,

Renee C. Fox, Neil J. Smelser, Mark Gould, and Mounira Charrad. His teaching was influential with a number of anthropologists who later became prominent, including David Aberle, David M. Schneider, Clifford Geertz, and Terence Turner. During the late 1940s and through the 1950s, Kluckhohn, emphasizing culture and values and as a leading proponent of "cultural anthropology," was the most influential teacher of anthropology at Harvard. Although he did not oppose Kluckhohn, Parsons's teaching drew on the contributions of the British "social anthropologists" along with the works of Durkheim and Weber. His balanced stress on both cultural and social factors contributed to the education of students in anthropology as well as, more famously, sociology. Geertz's writings come closest to representing his perspectives on anthropology.

Conceptual Development

On arrival at Harvard, Parsons was a promising young scholar of German historical economics, especially Weber. He soon broadened the range of figures he studied to include Alfred Marshall, Vilfredo Pareto, and Durkheim. He also embraced an emerging Harvard school of scientific methodology, especially the writings of the philosopher Alfred North Whitehead and the physiologist Lawrence J. Henderson, which emphasized frames of reference or conceptual schemes as essential to the initial phases of research.

Parsons's first book, *The Structure of Social Action* (1937), argued that Marshall, Pareto, Durkheim, and Weber had "converged" in emphasizing certain elements common to all human social action. Parsons proposed that ends, means, norms, conditions, and, in some formulations, effort are universals of social action. Meaningful social action is not possible unless one or more instance of each element is involved. He also proposed that every instance of human conduct may be understood as combining these basic elements. The set of elements constitutes a frame of reference for guiding the analysis of human social action in any and all situations. A study that fails to attend to each element is faulty by logical and empirical standards. Parsons criticized utilitarian and behaviorist theories for not attending to norms and idealist theories for focusing on ends and norms but underemphasizing conditions and means. These arguments about the foundations of social theory were supported by probing analyses of the works, empirical as well as theoretical, of his four predecessors—Weber, Durkheim, Marshall, and Pareto.

For Parsons, the conceptual scheme of *The Structure of Social Action* was foundational, but only a beginning. Within a couple of years, he had drafted a monograph, *Actor, Situation and Normative Pattern*, that extended his conceptual scheme to address relations among actors, social systems, system functions, motivational aspects of individual actors, and processes of social control. He used the monograph in teaching but withheld its ideas from publication until he could present them in less rudimentary form.

In 1951, in *The Social System*, Parsons shifted his central concept from the unit act, composed of ends, means, norms, and conditions, to social systems—systems of social interaction and social relationships. He also related social systems to cultural and personality systems, arguing that the three systems are integrated with one another by shared normative content. Normative orders take on moral authority from the cultural patterns that give them meaning, are institutionalized as structures of social systems, and, internalized in the superegos of personalities, regulate the motivational dispositions of individuals. Key chapters of *The Social System* explored the socialization processes by which individual personalities internalize the normative patterns of environing social systems and the processes of social control by which social actors, using positive and negative sanctions, informal and formal, require one another to act in accord with shared normative standards. A chapter on medical practice illustrated the processes of social control, analyzing the ways ill persons are expected to adopt the sick role, with its exemptions from everyday duties, and then the dynamics of physician-patient relationships.

The frame of reference centering on social relationships raised the question of how social systems are sustained over time. *The Social System* emphasized two functions: (1) resource allocation enabling actors to gain the means (e.g., tools, skilled personnel, and financing) to attain role-specific ends and (2) social integration involving the mechanisms of social control. Large social systems require formal mechanisms to fulfill these functions: economic markets for resource allocation and legal institutions for social integration.

In the following years, Parsons replaced this rudimentary account of functions with the "four-function paradigm." Unlike all earlier formulations in the history of the social sciences, the four functions are not an ad hoc list of functional requisites but rather an *analysis* of the concept of action system into four general aspects. The key insight is that any and all action systems can be analyzed in terms of the same four coordinate dimensions. This approach creates efficiencies in generalizing about how the operations serving each function are organized across empirical settings.

The four functions are as follows:

- *Pattern maintenance:* the processes of developing attachment to the basic principles, especially values, that distinguish a system from its environment. In societies, institutions of family, education, and religion serve this function, promoting socialization in a broad sense.
- *Integration:* the processes of reciprocal adjustment among a system's units to promote their interdependence. In societies, institutions, including civil and criminal law, community, and strata formation, serve this function by strengthening solidarity and social control.
- *Goal attainment:* the processes of aligning a system's relations with its environments in terms of shared ends. In societies, political institutions serve this function in setting collective ends and mobilizing resources for achieving them.
- *Adaptation:* the processes of developing and allocating resources to gain generalized control over the environment. In societies, institutions of economic production and market exchange serve adaptation.

A key application of the four-function paradigm is Parsons's theory of four functionally specialized subsystems of society. Its outlines emerged in the mid-1950s, but it was refined throughout the 1960s and 1970s. Late formulations identified the following subsystems: the economy for adaptation, the polity for goal attainment, the societal community for integration, and the fiduciary system for pattern maintenance.

In developing the idea of societal subsystems, Parsons started by integrating a sociological analysis of economic institutions with Keynesian theory in economics. The conception of the polity emerged through critiques of scholarship on power and authority, and on electoral, administrative, and executive institutions. These parts of the theory of societal subsystems progressed rapidly, yielding insightful essays on specific institutional complexes. The work on the integrative and pattern maintenance subsystems progressed more slowly, because the salient literatures were less highly codified. Parsons's writings on the fiduciary system brought together research on religion, family, socialization processes, and educational institutions. His conception of the societal community utilized research on reference groups, interpersonal influence, status systems, social classes, ethnicity, and legal institutions. The resulting formulations are less satisfactorily unified yet richly suggestive.

Parsons's theorizing on societal subsystems yielded insights into their complexity in modern societies: Every subsystem involves many differentiated and segmented institutions, its institutions are maintained over time and space by mechanisms of social control specialized to their functions, it meets functional needs and adjusts to changing conditions through functionally specialized dynamic processes, and it has processes of change facilitating long-term growth. Parsons crystallized these ideas in hypothesizing that each societal subsystem exchanges resources with each of the other subsystems to obtain means for its own operations. This idea originated in economists' treatment of the "circular flow" between business firms and households, which Parsons treated as exchanges between economic and fiduciary institutions. Parsons's conception of intersystem exchanges presents the four subsystems of society as operationally independent of one another yet dynamically interdependent through six complex exchanges.

Noting that processes within the economy and across its boundaries are mediated by money, Parsons identified additional "symbolic media" that mediate the internal and boundary operations of the other three subsystems of society. He designated political power as the symbolic medium of political processes, influence as the medium of the societal community, and value commitments as the medium of the fiduciary system. The conception of symbolic media and their regulation of societal dynamics is among Parsons's most fruitful ideas, although critics have identified problems with particular formulations.

In the 1970s, Parsons extended the four-function analysis to the relationships among cultural, social, personality, and behavioral systems. In his last major theoretical innovation, he proposed a still more comprehensive theory of the "human condition." It placed action systems, treated as integrative, including their cultural, social, personality, and behavioral aspects, in context with physical-chemical (adaptive) and biological (goal-attaining) systems as well as the transcendental potentialities for meaningful life (pattern maintaining).

Besides his contributions to general theory, Parsons wrote more than 100 essays on specific empirical problems. Their topics include the rise of Nazism, American family and kinship, the professions, social stratification, McCarthyism in the 1950s, economic and political modernization, sources of order in international relations, ethnicity, institutions of higher education, and American religious culture and values. Many of his essays became famous for their originality and empirical insight. Most of them applied, at least implicitly, the theoretical ideas that Parsons was exploring when he wrote them.

Conclusion

Parsons developed a complex theory that requires extensive study to comprehend. As few social scientists have invested the effort to master his theory, his work has long been criticized based on misinterpretation. One widespread misunderstanding is that Parsons's thought was rooted in conservative ideology; Parsons was an avowed and consistent liberal. Another misunderstanding is that Parsons was committed to static theory and had no interest in tension, conflict, and change; social stress and change were major concerns throughout his career.

Parsons is often called a grand theorist who advocated a closed system. He was a pragmatist with keen analytical abilities, who refined basic and general ideas in step-by-step fashion and explored their implications across many empirical domains. He was a persistent critic of his own thought, confident of his ability to improve on previous formulations. Perhaps his enduring legacy is a belief in the possibilities of progressive refinement of general ideas in the social sciences.

Major studies and significant collections of essays devoted to Parsons's work continue to be published. Most sociological theorists now agree with Jürgen Habermas that contemporary theory across the social sciences cannot be grasped without an understanding of Parsons's contributions.

PHENOMENOLOGY

Phenomenology centers on embodied experience of the phenomenal world. It resists both the realist claim for the priority of things, which results in objectivity, and the idealist claim for the priority of thoughts, which results in subjectivity. The term *phenomenology* was coined by Edmund Husserl, though he himself never escaped his idealist roots. His most famous pupil, Martin Heidegger, did.

Taking up the problem of "Being" from Husserl, Heidegger loosened it from its anchorage in the idealist-rationalist-intellectualist tradition without re-anchoring it in the realist-materialist-empiricist tradition, making him the first philosopher in 2,000 years to propose such an original solution to the mind/body problem.

Both philosophical traditions regarded the body as a sort of solid object, separating it in the idealist tradition from the ethereal subject mysteriously infused into it and reducing it in the realist tradition to a collection of material processes. The mind/body problem is the result of this dismantling of the person into subject and object. Heidegger solved it by finding the third term: *Dasein*, being there, to be there, being *the* there or *the* here, or *its* there or here. Neither consciousness, the personal *I*, nor the being of objects, *Dasein*, is the clearing in which things show up for us, which Heidegger calls being-in-the-world, or existence. Maurice Merleau-Ponty takes this way of being as the body "intervolved" in its environment. Following Heidegger, Merleau-Ponty proposed starting neither from the reality of objects, as the realists do, nor from the primacy of ideas, following the idealists, but from embodiment. From here/there, not only does the body never reduce itself to the paradigm of a physical object but also it resists etherealization into an idea. Materialization and etherealization are equally moves away from embodiment. Neither is the body's fundamental way of being; each is one of a spectrum of possibilities of embodiment. The social sciences in general, and anthropology in particular, hover between the clarities of the sciences, whose clout they envy, and the creativity of the humanities, whose insights they crave. Phenomenology offers the field a third prospect, one that takes the body as its point of departure, not the mind. By recentering phenomena on the body, phenomenology makes anthropology humanistic without making it subjective.

I am embodied in a world on whose spaces and objects I leave a trace. It is the material form of these traces that first discloses to the anthropological perceiver the particular style of being of the others who inhabit the world. But my reach for the world through the body is not evident only in material traces. It is also evident in embodied interactions. The acts of the other are not mysterious gesticulations that I must undertake to decipher. Rather, I find myself, without reflection, partially colonized by the intentionality of the other. The other's acts pull the world into the meaning it has for him or her, and pull my body along with it. I inhabit the other's significance. Our joint participation in the meaning of the world is what Merleau-Ponty calls "intercorporeity." Because intercorporeity is the ground of being, anthropology's engagement with the social world grasps being at its root. Phenomenology, like anthropology, begins from the insertion of the body in a world of objects and others. From this point of insertion, my body projects itself outward temporally as well as spatially, backward in memory, forward in anticipation, and sideward in imagination. Reckoning time from the body makes time temporality, human time. The body haunts the perceptual world. Phenomenology opens out into anthropology in the four domains delineated here: spatiality, intentionality, sociality, and temporality.

Spatiality

To begin at the edge, my world is not an outside I find my body *in*. The world and the body are codiscoveries at which I arrive through perception. Things open up at once around me and within me as, on the one hand, phenomena and, on the other, sensation. The two are indiscrete, hence Merleau-Ponty's curious phrase "the flesh of the world," which captures the thickness of being to which I and things belong. Landscape solicits the body. Insofar as I respond to its solicitations, I am enfolded in the contours of the world; insofar as I resist its solicitations, the landscape lays itself out before me, and I perceive myself over and against it. My participation, which Heidegger calls spatial *ec-stasis*, is the body's capacity to stand out from itself and be elided into things; my resistance produces both subjectivity, my capacity to separate myself from what I was once absorbed in, and objectivity, my capacity to treat the phenomenal world as an array of objects set before me. Phenomenological archaeology moves between the body in thrall to its surround and the body turned back toward its surround as if from elsewhere.

If the way the body takes hold of the landscape leaves a trace, then the trace solicits other perceivers to take hold of the landscape in the same way, to trace the trace, revealing corporeally something of the meaning its makers have made of it. Embodied encounters with objects and spaces snug perceivers

into the postures, gestures, and apprehensions of the bodies who have handled it before. My bodyscape complements the landscape. I orient to place even as I am oriented by it via my "somatic modes of attention," in Thomas Csordas's evocative phrase. It is this pull of spaces and objects on the body that archaeologists intercept in their embodied encounters with cultural ecologies. Shaping matter to meaning makes space into place. Through this interplay, my body gets attuned to my place, and I become native to it. The intervolvement of the body and space creates Pierre Bourdieu's "habitus."

Intentionality

Neither is my body an object, nor is it set over against objects as a subject. I and things are looped together in what Merleau-Ponty calls an "intentional arc." When I am unreflectively engaged in my projects, my body partakes of things via motor intentionality. Motor intentionality is the body's tacit anticipatory appreciation of its surround before as well as while it moves into it. I do not think and then act. Motor intentionality precedes any possibility of acting. Insofar as I am absorbed in courses of action, my body disappears from awareness. As Hubert Dreyfus puts it in his lectures on phenomenology, for the body, floors solicit walking, doorknobs solicit turning, and musical instruments solicit playing before I walk, turn, or play, respectively, or even think of doing so. These things come into being for me in perception, which absorbs me into them or them into me without my thinking about them consciously. By contrast, if my walking, turning, or playing is obstructed—I slip on the floor, or the knob won't turn, or I play the wrong note—I shift to "representational intentionality" and think about walking, turning, or playing as a conscious project. I have to take hold of the thing or of my body on purpose. When I do, others and things, including my own body, seal themselves up as objects, as if they were outside me, as if they preceded my engagement with them. But they only count for me because they engage my intentionality. I act toward them. It is because intentionality is not concealed in the body that anthropologists have the prospect of perceiving how other people inhabit their worlds.

The body is sutured to the world by the senses. The infant arrives synesthetic and learns over the course of its development to separate its sensuous experience into different senses, each of which conjures up its own reality: the rarefied, shifting, impalpable world of smell; the solidified, palpable, obtrusive world of touch; the light, colored, voluminous visual world; the tangible, textured, flavored world of taste; and the layered, modulating, episodic auditory world. These disparate perceptual modalities come together in things and are not perceptions *of* things but ways of being in the world. My appreciation of the world is intersensorial. Because the senses are learned, they can be culturally constructed. Intersensorial perceptions are ways of being that I share with my consociates. David Howes has inaugurated inquiry into this field as the anthropology of the senses. The consequence of the cultural shaping of sensory experience is that any body's *lebenswelt*, its lifeworld, is culturally textured. Because of their disciplinary commitment to being present to acts and others, anthropologists have access to the luminous moments when things make sense.

Sociality

The world is not an arrangement of objects but a configuration of meaning. When I step into the other's configuration, my world reorients itself around his or her body, re-polarizing my perceptual field. Things, as Merleau-Ponty puts it, are pulled into the vortex of the other's configuration of meaning. Because the other's intentionality is not concealed within his or her body, it becomes perceptible in the shape of the body and the shape of the environment. This is not to say that I might decipher the other's body as a clue to his or her subjectivity but to acknowledge that I feel the pull of the other's perceptual hold on what was hitherto my world. The other person's body is the vehicle of his or her form of behavior. So the other's body does not appear to me as an object but as "the eloquent relic of an existence" that is not my own. I perceive in the other's body a prolongation of my own ways of handling objects, others, and acts. I and the other are enmeshed in being in the world. It is not that I cannot overcome my estrangement from other subjects but that I cannot disentangle myself from our copresence in the world.

This perceived copresence is neither a sort of mind reading nor a mode of empathy, which is why in his later work, Merleau-Ponty switches from calling it "intersubjectivity" to calling it

"intercorporeity." I can turn my attention to my own body as an object just as I can turn my attention to the body of the other as an object. If I do so, not only does the other's subjectivity seem to disappear behind the opacity of his or her body, but also, instead of being transparent to my project, my own body obtrudes itself on my awareness as an object. In a single gesture, I have made myself what Merleau-Ponty calls the "transcendental Ego," and turned the world, the other, and the body into objects of my consciousness. I am under the illusion that nobody else is there. Objectivity and subjectivity are both inflections of the intercorporeity out of which they come forth and into which they fall back when, after consciously attending to my being in the world, I return to acting in it. Thus, solipsism is not a fate; it is an accomplishment. To warrant its own project, anthropology need not be committed either to objectivity or to subjectivity but to intercorporeity.

Temporality

Like the spatial horizons of the *here*, the temporal horizons of the *now* open up around me. As I turn an object over in my hand, the object is not deprived of the part of it I have just seen or of the part of it I am yet to see. This is, to take up Heidegger's term again, temporal *ec-stasis*, the way the body extends itself from its present into its past and its future. Each present collects up its past, which has collected up its past ad infinitum. But this is also true of the future, which exerts the same pull on the present that the past does. Each act, each thought, projects a future into which it will mold itself as if it already awaited my project. Each of these temporal pulls deforms the other, so that the present loops through the past and the future, like a Möbius strip. Temporality transforms space by bringing to bear on my experience of both the past it no longer materializes and the future it only promises.

Time fringes the body, so that its past experience is present to it in acts of memory. A memory that arises unbidden announces the bearing of the past on the present through the body. The effect of this is that the past and the present, like the body and space, are mutually implicated. Landscapes are infused into memory so that the past is as constitutive of experience as the space itself. Like memory, imagination stretches my body toward a world that holds itself out to me as if I proposed to act in it, even though I cannot. I have a possible world, as one might say, in mind, by which I mean that I experience an imaginary world as a horizon of possibility, though of an attenuated kind. Memorial and imaginary worlds are sustained only by my attention; if I turn away from one, it disappears. Insofar as anthropologists retrieve absent worlds through memory and imagination, they participate in what Alfred Gell identifies as an anthropology of time.

Imaginary worlds can be elaborated by acts of narration. Stories have two ontological presentations: (1) as a realm of events transpiring in another space and time and (2) as a realm of discourse transpiring in the here and now. The pull of stories on events is as evident in tellings as the pull of events on stories. William Labov describes stories as "transformations of experience." They enter us into two temporalities: (1) the time it takes to tell the story and (2) the time the events in the story take. They are geared into everyday life twice: (1) once to while away everyday time and (2) once to enter into an alternate temporality. Stories, and other doubles of space, time, and the body, Erving Goffman points out, replay our realities back to us under a more consequential interpretation of them, as if events had the beginnings and ends that narrative attributes to them. Dell Hymes describes our cultural habit of repeating ourselves to ourselves as "narrative thinking." It is by virtue of narrative thinking that humans attribute causality to everyday life. Narrative makes time human. By virtue of phenomenology, anthropology situates the body with objects and others in its spaces and times.

Pike, Kenneth

Kenneth Lee Pike (1912–2000) was a world-renowned theoretical linguist, anthropologist, Christian philosopher, missionary statesman, and Bible translator. He was one of the key founders of American linguistics and is widely known for his integration of faith and science.

Born in East Woodstock, Connecticut, Pike received his bachelor's degree in 1933 from Gordon College (then in Boston). In 1935, he joined the Summer Institute of Linguistics (today SIL International) and served in Mexico studying Amerindian languages. He received his PhD in linguistics at the University of Michigan in 1942 under Charles Fries and Leonard Bloomfield and later served for 30 years on the University of Michigan faculty. Pike was the recipient of 10 honorary doctorates/professorships from universities around the world, including the University of Chicago, Université René Descartes, the University of Lima, and Albert-Ludwigs University in Freiburg, Germany. His leadership roles included serving as president of the Linguistic Society of America, president of the Linguistic Association of Canada and the United States, and, from 1942 to 1979, president of the SIL. He was chair of the University of Michigan Linguistics Department from 1975 to 1977 and director of the English Language Institute at Michigan at the same time. For 40 years, he divided his time between the University of Michigan and SIL, as director of the SIL school at the University of Oklahoma, and establishing other SIL schools around the world. He lectured in 42 countries and studied well over 100 indigenous languages in the field, including languages in Australia, Bolivia, Cameroon, Cote d'Ivoire, Ecuador, Ghana, India, Indonesia, Mexico, Nepal, New Guinea, Nigeria, Peru, the Philippines, Sudan, and Togo.

Ken Pike's contributions to the field of linguistics combined with his dedication to the minority peoples of the world brought him numerous honors. He was elected to the National Academy of Sciences in 1985. He was the recipient of the Presidential Medal of Merit from the Philippines and the Dean's Medal at Georgetown University. He was nominated for the Nobel Peace Prize for 15 years in a row and for the Templeton Prize three times. At the time of his death, he was a member of the American Philosophical Society, the American Anthropological Association (AAA), Professor Emeritus of the University of Michigan, and President Emeritus of the SIL. Pike published 30 books, 200 academic articles, and more than 1,000 poems. He was actively lecturing and writing until 1997, when his health required him to slow down. His last book publication was his five-volume set of poems titled *Seasons of Life* (1997). And he had just completed a historical essay on *Early American Anthropological Linguistics* a month before his death (it was published posthumously in 2003).

Pike's Contribution to Linguistics

Pike's major theoretical contribution to linguistics was his development of tagmemics, an important

theory in American linguistics for analyzing languages in the 1940s to 1960s. Pike's magnum opus on tagmemic theory, *Language*, was first published in three volumes in the 1950s and then in a second edition in 1967. His most widely used book, though, and a true classic, is his *Phonetics* (1943). Published 70 years ago, it is still in print and was used as a text in courses at the end of the 20th century.

Pike's practical contribution to linguistics was in his amazing ability to train students to learn, analyze, and publish data on then virtually unknown minority languages. One of his major goals was to help missionaries with their linguistic challenges. To that end, he established linguistic workshops around the world in which he and his doctoral students helped thousands of field researchers and Bible translators with difficult analytical challenges in unwritten indigenous languages. When Pike first went to live with the Mixtec people in Mexico in 1935, he knew no Spanish, nor did the Mixtecs. So he began learning their language monolingually (learning a new language by gesture only) since neither he nor his informants knew a common outside language, such as Spanish. This method eventually developed into Pike's famous pedagogical "monolingual demonstrations" before university audiences. At these events, a moderator would introduce Pike to an audience, and then the moderator would bring someone onto the stage from a foreign country who spoke a language Pike did not know. Then, with the foreigner's permission, Pike would begin to elicit some words and sentences of the language from the foreign speaker without either of them speaking a word of English. The audience would be spellbound watching Pike, who within 30–40 minutes would begin to carry on a conversation with this foreigner in his or her own native language.

No one would have guessed in the 1940s that around the world there existed some 4,000–5,000 local tribal languages that were unknown and unidentified even to linguists. This holistic approach to language learning became Pike's trademark. He taught thousands of his students how to learn such languages by using the method that he demonstrated countless times in his dramatic monolingual demonstrations. Pike's method is described best by Adam Makkai in an article titled "The Nature of Field Work" (1998).

Today, Pike's students have published thousands of linguistic analyses on 1,200 indigenous languages in 50 countries. Most of those languages had never been studied before, most are spoken by just a few hundred to a few thousand people, and almost all fall under the category that is now called *endangered languages*—defined as those likely to become extinct by the end of the 21st century.

Pike's Contribution to Anthropology

Pike's major contribution in anthropology was his development of the *emic/etic* concept. Pike published this conceptual contrast in 1954 in his first edition of *Language*, and the two terms are found in common usage in the vocabularies of most anthropologists today. In fact, most anthropologists today use insights about the different perceptions of reality among various cultural groups as the principal conceptual tool of their trade. The emic/etic distinction underlies a basic contribution of modern anthropology, a uniquely anthropological tool for understanding the worldviews of other cultures. Anthropologists make their living at least partly because of their unique ability to make the distinction between emic and etic. *Etic* refers to the point of view outsider scientists may take in explaining the customs of an indigenous people, while *emic* refers to the perspective the natives themselves may have for why they practice certain customs. Neither explanation is necessarily right or wrong, but just two different ways of explaining cultural or linguistic phenomena. For a short explanation of the concept, see the online report by Karl Franklin, *K. L. Pike on Etic vs. Emic* (1997).

Pike's High Point in Anthropology

The high point of Pike's role in the AAA came in 1988. During that year's annual meeting of the AAA, Pike and Marvin Harris, American anthropology's leading theoretician at the time, had a historic public debate on their differing uses of the emic/etic concept. That exchange resulted in a 1990 book titled *Emics and Etics: The Insider/Outsider Debate* by Thomas Headland, Pike, and Harris.

Pike's Low Point in Anthropology

Pike also had a low point in anthropology. He was a controversial figure among anthropologists because he was the president of SIL, a Christian-based nongovernmental organization made up of lay missionaries doing Bible translation for minority language groups around the world. This low point surfaced in the AAA in 1975 when anthropologists brought a formal charge of ethnocide (cultural genocide) against SIL to the AAA's Committee on Ethics (COE),

alleging that SIL undermined the traditions of indigenous peoples by introducing Christianity. The case is named in the SIL's *Pike Special Collection* archives as "COE's Case 75-2," the same name the AAA gave to the case. In May 1975, the AAA wrote a letter to the SIL describing the complaint and inviting SIL to formally respond. Pike replied to the AAA in a 15-page letter dated May 21. After a 1-year investigation, the COE's report to the AAA Executive Board declared unanimously in favor of SIL. In a letter to Pike dated September 20, 1976, AAA Executive Director Edward Lehman stated, "At its 85th meeting in May [1976], the [AAA] Executive Board accepted that [COE] recommendation, also by a unanimous vote."

Pike's Contribution to Christian Philosophy

We cannot close this review of Pike's life without mentioning his Christian philosophy and how this was such a driving force in his life and leadership of SIL and in his contribution to linguistics and anthropology. Pike was keenly interested in the spiritual dimension of his career, as seen in his relationship with Wycliffe Bible Translators, the sister organization of SIL. He and Angel Merecías translated the New Testament into the San Miguel Mixtec Indian language, completed in 1951. Pike was above all a convinced Christian theist who influenced thousands of people toward religion. He wrote numerous religious articles and books. His *With Heart and Mind* (1996) defended scholarly and intellectual approaches to Christianity, maintaining that Christian faith and academic scholarship can be intimately integrated. He published his most personal autobiographical account of his religious sojourn in a short essay, *My Pilgrimage in Mission* (1997). His sister wrote a longer biography of him, *Ken Pike: Scholar and Christian* (1981), describing his religious philosophy. He also wrote a personal autobiographical account of his career called *Linguistic Pilgrimage* (1998).

Pike Archives

Today, the huge volume of Pike's personal and work-related papers is archived in the *Pike Special Collection* in Dallas, Texas. These materials include Pike's unpublished academic papers, lecture notes, teaching resource materials, correspondence, diaries, awards, and honorary recognitions, as well as many photos and work-related artifacts. Many other details on Pike are found in the *Collection*.

Pitt Rivers, Augustus Henry Lane Fox

General Pitt Rivers (1827–1900) was a soldier, an archaeologist, the first Inspector of Ancient Monuments, and a leading contributor to the development of anthropology in 19th-century Britain. His donation of 20,000 objects to the University of Oxford in 1884 was a key moment in the

establishment of the study of material culture as a major aspect of British anthropology.

Biography and Major Works

Augustus Henry Lane Fox (he was not to take the name Pitt Rivers until 1880) was born in Yorkshire, England, in 1827. He was privately educated, joining the Grenadier Guards at the age of 18. He served in the army for 37 years, retiring in 1882 with the honorary rank of Lieutenant-General, which entitled him to use the rank of General. He served in Malta, Ireland, and Canada, as well as in various postings in the British Isles, and was decorated during the Crimean War.

The life of an army officer in the 19th century was very different from what it is today; it was possible to withdraw from active service from time to time, and officers were also given substantial periods of leave. Pitt Rivers took advantage of these opportunities to further his interests in archaeological fieldwork and in the development of technology—an interest that had developed out of his professional involvement in the testing of rifled weapons in the early 1850s.

It was Pitt Rivers's contention that particular types of objects evolved in much the same way as Darwin had shown that animals did: moving by progressive small changes from the simple to the complex. He believed that if sufficient objects could be gathered together, it would be possible to demonstrate such evolution of forms in sets of series. He also believed that ethnographic objects illustrated ancient forms of material culture that had decayed and had been lost and that they provided insights into the thinking of past generations. He demonstrated his views in a series of papers he gave to the large number of learned societies to which he belonged from 1860 onward.

To demonstrate the full sequence of the evolution of form of particular types of artifacts, Pitt Rivers needed to acquire a large number of objects. By the 1870s, his collection numbered well in excess of 10,000 objects and was described as filling his London house from cellar to attic. Believing that public education was important for demonstrating to the working classes that evolution rather than revolution was the natural mode of progress, in the 1870s, he loaned his collection to the South Kensington Museum (later the Victoria & Albert Museum) for public display, first at its branch in the poor working-class area of Bethnal Green and then in the main museum site in West London. When his relationship with the authorities at South Kensington broke down, he agreed to donate his collection to the University of Oxford. Soon after donating his collection to Oxford, however, he began to amass a second collection, broadly similar to the first. Much of this collection was displayed according to his evolutionary principles at his private museum in Farnham, Dorset.

In 1880, Pitt Rivers inherited a large estate from a distant relative and took the additional surname by which he is known today. He was a leading member of many of the learned societies in the fields of anthropology and archaeology from the 1860s until his death in 1900. His most active period of involvement was from the 1860s to the 1880s, during which time he served as an officer of many societies, contributed many papers (many of which were later published), and exhibited many objects at meetings. He was elected a fellow of the Royal Society in 1876.

The publications for which he is most celebrated are the series of privately published accounts of his archaeological excavations on his private estate at Cranborne Chase on the borders of Dorset and Wiltshire (1887–1898) and the companion volume, published just after his death, comprising a catalog of his collection of the art of Benin. Of his earlier publications, perhaps the best known is the paper he gave to the Royal Institute in 1875 titled "On the Evolution of Culture."

Pitt Rivers died in 1900 at the age of 73. It is perhaps typical of his independent personality that he had decided, most unusually for the time and especially for a member of the landed gentry, to be cremated. His remains were placed in a memorial in Tollard Royal church in his country estate.

Pitt Rivers married into the intellectual and liberal aristocratic Stanley family in 1853. One of his sons-in-law was the evolutionist John Lubbock (1834–1913), one of his grandsons was the anthropologist and eugenicist George Pitt Rivers (1890–1966), and one of his great-grandsons was the anthropologist Julian Pitt Rivers (1919–2001).

Critical Contributions to Anthropology

Pitt Rivers's views on the evolution of forms of material culture were very influential in Britain during the 19th century; his contributions were well received,

and his death was noticed in many obituaries. His major contribution to anthropology was his practice of thinking about anthropological topics through the medium of material culture, an approach that underwent a renaissance in the late 20th century.

His most lasting contributions were to the fields of museum anthropology and museology. His publications about the arrangement of artifacts by type and in series, though seldom if ever followed in practice today, are still considered required reading for museologists. His views on the contribution museums can make to public education and the need for different modes of display have also had a lasting influence.

Pitt Rivers's Legacy

Pitt Rivers's major legacy is his collection of some 50,000 ethnographic and archaeological objects. The first collection, of more than 20,000 objects, became the founding collection of the University of Oxford's Pitt Rivers Museum. This is visited by more than 300,000 people every year and is a leading center for collections-based research in anthropology, archaeology, and museum ethnography. The famously dense museum's displays continue to be organized primarily by type, rather than by culture, in a manner that reflects Pitt Rivers's own preferred arrangement. However, the displays are no longer arranged in supposed evolutionary series from simple to complex but are arranged to illustrate the variety of solutions people around the world and throughout history have found to the problems of existence (how to obtain food, shelter, and protection from the elements; how to attract a sexual partner, deal with misfortune, and intercede with ancestors)—a modern take on Pitt Rivers's overriding interest in form and function. Pitt Rivers's second collection was broken up from the 1950s, so it no longer exists as a single entity but is dispersed in public and private collections around the world (a manuscript catalog containing detailed illustrations of many of the objects survives at Cambridge University Library, MS Add. 9455). In preserving many thousands of artifacts for posterity, and in thinking about them so rigorously, Pitt Rivers provided one of the major stimuli for museum-based anthropology in the United Kingdom.

Plato

Plato, an Athenian, was born in 427 BCE in a noble family. Although drawn in his youth to politics and poetry, after he met the philosopher Socrates he devoted his life to philosophy. After Socrates was tried for subversion and executed in 399 BCE, Plato reportedly journeyed throughout the Mediterranean for about 12 years before returning to Athens and establishing the Academy—a private institution devoted to philosophic inquiry in all areas. He is traditionally credited with writing 35 dialogues and 13 letters. He attempted (unsuccessfully) to educate the Sicilian tyrants Dionysius I and II. He died in 347 BCE, with his final manuscript (the *Laws*) still incomplete.

For modern anthropology, what is important from the work of Plato and his student Aristotle is that they present an analysis of the structure and function of human nature that in many ways has not been superseded. Plato laid out the fundamental directions that would influence the entire Western philosophic tradition. Though he often presented his ideas as teaching doctrines, he said he did not record his most important thoughts. His dialogues are masterpieces of philosophic pedagogy whose structure, imagery, and dramatic action together point in

directions that have to be followed and completed by the intellectually alert reader.

The Human Being in the Whole

Plato's *Republic* is the urtext of Western philosophy. Beginning with the image of going down to the port of Athens and going back up to the city, the dialogue deals with what is "up" and "down" in human life. The measure is to be found in justice rooted in the structure of psychic life oriented toward the cosmic Whole. Socrates constructs three cities based on human need: (1) the basic city, dedicated to satisfying natural needs through a division of labor; (2) the luxurious city, creating surplus goods and the needs corresponding to them; and (3) the city purged of luxury, organized on three levels: the artisans of the first two cities and, above them, the army consisting of guardians and their auxiliaries. These levels parallel three "parts of the soul": the appetitive, the spirited, and the rational. What subsequently become the "cardinal virtues"—prudence, justice, fortitude, and temperance—have their origin here. Justice involves reason ruling and producing harmony, with each part fulfilling its function. Fortitude and temperance are conditions for having and following practical wisdom.

Plato warns that there might be something that we do "with the whole soul" that would force a reexamination of the tripartite vision. The movement in that direction takes place in the middle books, where reason turns from the practical to the theoretical, from ruling "downward" to looking "upward." Plato opens that movement upward by means of three images: (1) the sun as the image of the ruling Good/One, (2) the diagram of the Line of Knowledge, and (3) the allegory of the Cave. The latter represents humans generally as in a dark cave chained to the limited and distorted views provided by their culture. Outside, one can see in the light of the sun. Socrates announces that just as the sun makes possible the seeing of what is seen, so the Good makes possible intellectual understanding of the intelligible.

The Line is a marvelous device constructed to lead us to apprehend the framework of human wakeful life governed by pursuit of the Good. Socrates calls for the construction of a proportionately divided line that is subdivided by the same proportion as the original division. He does not tell us but puts us in a reflective position to see that this represents a universal geometric theorem in a visual instance: The central two of the four sections will be found to be always equal. The divided line is then taken metaphorically to represent the interplay of intellect and the intelligible with sensing and the sensible. Mathematics is the first step out of the sensory; above it is the region of Plato's famous Forms (*eide*), a region that we are invited to fill in with, among other things, the universal features involved in the interplay of the fourfold. He further points out that as geometry develops a deductive system governed by a few axioms and postulates, it should be possible to arrive at a wider coherence by moving "up" from the fewness of the geometric principles toward what we are to project as the One, the Good in light of which the intellect searches, seeking unity in what otherwise would be perceived as incoherent multiplicity. Filling in those Forms would lead back to the moral considerations that preceded the intellectual ascent. The words we use, though sensory, stand in for the apprehension of universal meanings. Plato's Forms turn out to be not the occupants of a "Platonic heaven" but the forms of language. As Parmenides says in the dialogue named after him, "No Forms, no language."

Furthermore, though Plato describes the situation of embodiment as a tomb or a mud-bog or a prison, this describes psychologically the difficulty involved in living the theoretical life. In the *Timaeus*, the body is the *house* of the soul.

Social and Political Thought

Plato was an intellectual heir to the Greek 5th century, an era of intellectual ferment in all areas. Traditional beliefs and customs were subject to searching critique, invoking "nature" as the standard for judging human practices. "Nature" refers to an order discovered but not made by man, capable of guiding us to what is genuinely good for human beings. Plato continues the tradition of evaluating social practice in light of nature. In the *Gorgias*, Plato's Socrates refers to politics as the art of caring for the soul. This conception of politics is at work in everything Plato wrote on that subject. Throughout the *Republic*, the *Laws*, and elsewhere, political and social life is evaluated in terms of what is naturally good for the soul. As a result, Plato offers harsh critiques of existing practices and radical proposals for

reform (whether practically intended or not). Plato proves highly critical of Greek conventions in at least four areas: religion, property, the family, and the relations between the sexes.

Discussions of the gods suggest that Plato, like the Sophists and pre-Socratics before him, considered the pantheon largely or wholly fictional. Socrates argues that the various conflicts among the gods related by Homer and Hesiod are not true, nor would gods take part in conduct traditionally attributed to them. The *Laws* contains one of the earliest examples of natural theology. The Whole exhibits some form of intelligible order, such that the fates of human beings are not in the hands of capricious divinities.

Private property and the biologically based family unit are subject to searching critique in the *Republic*. Privacy of all kinds stands in the way of devotion to the well-being of the political community, and the desire for exclusive possession of people or things is attachment to lower goods at the expense of higher ones. Hence, in the purportedly best regime laid out in the *Republic*, private property and private families among the ruling class (not among the artisans) are abolished to foster the unity of the city. These reforms may or may not have been seriously proposed. In the *Laws*, the *Republic*'s city is declared impossible for human beings, and a less radical political form is proposed. Exclusive families and private property are allowed, though family life and the distribution of property are strictly regulated.

Another radical reform proposed in the *Republic* (but not followed in the *Laws*) is the complete equality of the sexes in the ruling class. Women as well as men are to be warriors, sharing the same barracks, exercises, and (for the most part) tasks; some of the philosopher-kings may be women as well. However, the discussion of sexual equality is prefaced by the comment that most men are better than most women at most things.

Plato is as critical of traditional political regimes as he is of social conventions. Democracy is criticized both in the *Republic* and in the *Laws*. "The many" are depicted as ill-educated, self-interested, and guided primarily by pleasure and caprice rather than by a concern for virtue. The need to work for a living incapacitates them for higher pursuits. Socrates considers the political community to be the "biggest sophist," using its standards of praise and blame to corrupt the rare individual capable of truly living well (i.e., philosophically). Most other traditional Greek regimes (oligarchy, warrior-aristocracy, etc.) also come in for harsh critique in the *Republic*, being corrupted by their allowance of private property and hostility to philosophy. The only regime besides the best regime that has any place whatsoever for philosophy is democracy, where letting each citizen live as he pleases allows philosophers to conduct their inquiry in private.

Polanyi, Karl

In the decades following World War II, economic anthropology occupied a central place in the parent discipline. The focus of this attention was the "formalist/substantivist" debate, an argument about the applicability of neoclassical economics to the world as a whole that was itself a replay of the "Battle Over Methods" (*Methodenstreit*) in late-19th-century Germany. Karl Polanyi (1886–1964) launched this debate, but he was neither an economist nor an anthropologist. He was trained originally in law in Budapest and worked as an economic journalist in Vienna after fighting for Austria-Hungary in World War I.

Theories and Key Works

The Great Transformation: The Political and Economic Origins of Our Times was first published in 1944. It is primarily about the development of the "free market" in 19th-century Britain and society's

reaction to the market's unprecedented domination of economic life. It was shaped by Polanyi's experience of England during the 1930s, where he gave lectures but never held an academic post. Polanyi did not claim that it was a work of history: He was not searching for a convincing sequence of outstanding events but for an explanation of their trend in terms of human institutions. His practical knowledge of the economy was largely acquired during the 1920s in Vienna. He always read voraciously, and his anthropological theories were based on notes he took down from Karl Bücher, Bronisław Malinowski, Richard Thurnwald, and Marcel Mauss. Polanyi's main venture into anthropologists' territory was a historical study, *Dahomey and the Slave Trade*, and Africa was a principal focus for his main followers. After moving from Britain to the United States, Polanyi conducted historical research on the economy of "archaic" societies. This interdisciplinary collaboration at Columbia University led him to suggest a "substantivist" approach to economic life that appealed to some anthropologists.

In his seminal essay "The Economy as Instituted Process," Polanyi argued that the "formal" and "substantive" meanings of the word *economic* have been conflated. The first refers to a means-end relationship, the mental process of economizing, whereas the second is concerned with the general provisioning of material wants in society. Polanyi held that the first notion led to a complete rupture between the economy and life. Most nonindustrial societies are ruled by institutions that guarantee collective survival, but industrial societies have a delocalized economy, "the market," in which individual decision making rules. He proposed that anthropologists and historians should focus on noncapitalist economies, leaving modern capitalism to the economists. A "formalist" approach emphasizes the regular operation of ideas, in this case the universal claims of neoclassical economics, while a "substantivist" approach gives priority to the empirical content of material circumstances. The terminology may be traced back to Plato; and elsewhere in the same volume, Polanyi acknowledges Aristotle's significance for him. The conceptual opposition between "form" and "substance" was commonplace in the 19th century, especially in Germany. It entered economic discourse through Carl Menger and Max Weber. Both formalists and substantivists recognized the importance of markets for economic coordination, but Polanyi held that the market principle was not the main "mode of integration" in world history.

He had already argued in *The Great Transformation* that the principles of reciprocity, redistribution, and householding were of greater significance than the market in nonindustrial societies; "householding," the principle of thrifty budgeting for self-sufficiency, disappeared from the set in his later writings. Reciprocity was a symmetrical form of exchange between persons or groups of equal standing, as in the Trobriand *kula* ring. Redistribution reflected a principle of centricity, whereby resources were pooled and handed out through a hierarchy, as in the potlatch rituals of the American Northwest Coast. These forms of integration could co-exist, but there was an implicit evolutionary sequence. Reciprocity was dominant in "primitive" egalitarian societies with simple technologies, whereas redistribution usually presupposed the possibility of storing a surplus and some degree of social stratification. It was exemplified by the societies of the Ancient Mediterranean. As for the market, Polanyi consistently played down its significance before the dramatic changes that occurred in 19th-century Europe. He preferred Aristotle's emphasis on a self-sufficient *oikos* ("house") to Adam Smith's human propensity to "truck and barter," which reduced all value to a utilitarian calculus. Markets were present in primitive and archaic societies, but they did not yet pose a threat to the integration of the economy in the wider social system since they were "embedded" in it. Their administered prices were typically stable over long periods, as were the interest rates. Commercial activity was concentrated in specific "ports of trade," where it had little or no direct impact on the bulk of the population.

In Polanyi's philosophy of history, the rupture created by industrialization—and above all, the creation of a market for free wage labor in Victorian England—led to a "disembedding" of the economy. This "utopian" elevation of the market principle to the dominant form of economic integration was bound to fail. Society could not tolerate the buying and selling of nature, humanity, and society itself in the form of the "fictitious commodities" of land, labor, and money, so it sought to defend itself. Polanyi identified a "double movement": on the one hand, the economics of laissez-faire and, on the other, social resistance, which, in 19th-century Britain, ranged from the Chartist movement and

trade unions to national protectionism. This led inevitably to the crises and world wars of the 20th century. The market mentality responsible for these horrors was now "obsolete," Polanyi claimed; and, indeed, the New Deal and the consolidation of welfare states in Europe helped usher in a new era of social democracy that put an end to the market illusion forever—or, as it turned out, for a few decades.

Money and markets have their origin in the effort to extend society beyond its local core. Polanyi believed that money, like the sovereign states to which it was closely related, was often introduced from outside, and this was what made the institutional attempt to separate economy from politics and naturalize the market as something *internal* to society so subversive. He distinguished between "token" and "commodity" forms of money. Token money was designed to facilitate domestic trade, commodity money, foreign trade; but the two systems often came into conflict. Money was not a commodity for Polanyi; it was purchasing power. In "Money Objects and Money Uses," he approached money as a semantic system, like language and writing. His main point was that only modern money combines the functions of payment, standard, store, and exchange, and this gives it the capacity to sustain those functions through a limited number of "all-purpose" symbols. Primitive and archaic forms attach the separate functions to different symbolic objects, which should therefore be considered to be "special-purpose" monies. Here, Polanyi argued against the idea that money is only a medium of exchange and in favor of a multistranded model of its evolution.

Polanyi's Legacy

Polanyi built a school of followers led by an anthropologist, Paul Bohannan, and George Dalton, who was originally trained in economics. Together they edited the landmark collection *Markets in Africa*, where they showed that while traditional African societies knew many kinds of marketplaces, which often had major social, political, and even religious significance, these remained "peripheral" in comparison with other forms of integration. The rise of the modern market principle, as a result of new patterns of cash cropping for export, was bound to undermine these traditional markets and the societies they served.

Polanyi's reputation has been rising palpably in the past two decades. He offers a distinctive, Eurocentric vision of world history, a salutary reminder that a wider vision is possible and indeed necessary. Institutes in Montreal and Paris named after Polanyi keep the interdisciplinary flame burning today. His ideas have never dropped out of sight, but attempts to place Polanyi on a par with Karl Marx, Max Weber, Émile Durkheim, and Georg Simmel have never really taken off. There are several reasons for this. His depiction of capitalism as a self-regulating (and ultimately self-destructive) market missed some of the key political features that were central to its resurrection after the war. His formal analysis and conceptual system were fuzzier than those of the other founders. His main book succeeds as a narrative more than as a basis for effective action. He abandoned his populist critique of mainstream capitalism to become a guru in the academic study of nonindustrial economies.

Polanyi's idea that the economy is normally "embedded" in social institutions has become a cornerstone of economic sociology in recent decades, but in a watered-down form. His pluralist approach to economic institutions, in opposition to fundamentalisms of both the right and the left, is still attractive. But a tension remains between claiming that the "free market" is "disembedded" from political oversight and acknowledging that it is in reality "embedded" in political processes that are made largely invisible by liberal ideology. *The Great Transformation* was a work of prophecy, and broadly speaking, the prophecy failed. The 1940s did indeed see a world revolution, but its immediate outcome was not foreseen by Polanyi. An anticolonial revolution accompanied a revival of the world market under American hegemony, fueled by increased public spending. The past three decades have seen a replay of the "self-regulating market" scenario and its possible demise, so Polanyi's vision offers a perspective on the political and economic origins of our own times, too. His time as a prophet may yet come.

The dramatic expansion of finance capital in recent decades is directly analogous to the historical phenomenon identified by Polanyi previously. The current globalization of market capitalism has a "double movement" of its own. Society now protects itself not through the formation of national trade unions within but through transnational networks

of activists protesting against the power of the G8 states. Jean-Louis Laville leads a recent revival of Polanyi's influence in France, linking his legacy explicitly to that of Marcel Mauss, whose socialist politics have always been given greater prominence in that country. Global markets and "global civil society" implicate each other; our task is to understand the changing institutional forms of this interdependence. By outlining the theoretical foundations of a plural approach to the economy rather than appealing to a radical alternative, Polanyi opened up the entire field of human possibilities, most of which already exist in our societies.

Political Economy

In anthropology, political economy refers to a critical and historically grounded theoretical subfield concerned with the influence of economic systems on the constitution of power and on the process of cultural production. Political economy is an interdisciplinary theoretical approach, with representations in political science, economics, sociology, and geography, among others. It has made a significant contribution within anthropology, bringing attention to the effects of globalization and capitalist integration on the process of cultural construction and the lived realities of humans around the world. This entry focuses on the historical development of political-economic perspectives in anthropology.

Origins

The origins of political economy can be traced back to the classic political economists of the 18th century, most notably Adam Smith and David Ricardo. These scholars sought, in the context of the Industrial Revolution and rapid economic growth, to understand the role of the state, social classes, production, and exchange in the process of capitalist wealth accumulation. Smith and Ricardo proposed that the "invisible hand" of the market, based on the laws of supply and demand, could best create wealth in the absence of governmental intervention. This view continues to influence many of today's academic disciplines, most notably economics. Political-economic perspectives in anthropology, however, are influenced by another strain of political economy. In the 19th century, Karl Marx and Friedrich Engels continued to examine questions related to wealth formation. However, Marx and Engels rejected the idea that capitalist markets were ultimately rational and moral. Integrating examinations of the moral aspects of capitalist wealth production into their analyses, they argued that wealth

generation under capitalism was dependent on the ability of the wealthy capitalist class to control the means of production (e.g., land, water, and other natural resources) and to profit from the surplus labor supplied by wage laborers (the difference between their productivity and their wages). Marx and Engels, thus, argued that capitalist production regimes were exploitative, eventually resulting in an unjust distribution of wealth, social hierarchy, and discontent. While not all political-economic analyses in anthropology today are purely Marxist, they typically share this focus on the production and reproduction of inequality enabled by a division of labor in society, as well as a historical and materialist orientation to their subject of study.

Henry Lewis Morgan, another of anthropology's intellectual ancestors, argued along with his contemporaries Marx and Engels that the means by which people make their living exert a heavy influence on the social and political organization and ideologies of society. This materialist orientation ties cultural production to the process of making a living and the structures of power that shape and constrain those activities.

The Twentieth Century

While the materialist perspectives of Morgan, Marx, and Engels continued to influence many branches of social theory in the 19th century, the development of anthropology as a discipline in the early 20th century was heavily influenced by Franz Boas, who rejected materialist perspectives and grand theories of cultural evolution. It was not until after World War II that the roots of anthropological political economy were further developed. Around the middle of the 20th century, materialist approaches were revived by the work of Julian Steward and Leslie White, both of whom saw the genesis of human culture in the subsistence strategies people used to adapt to their environments. White and Steward would go on to train some of anthropology's most influential scholars, including Robert L. Camiero, Lewis Binford, Elman Rogers Service, and prominent political economists like Sidney Mintz and Eric Wolf.

Meanwhile, scholars were beginning to question modernization theory's assumption that capitalist integration and infusion would create growth and stability. Development programs based on these assumptions were failing, the Cold War was destabilizing fragile postcolonial regimes, and observations suggested that, in many cases, disparities between the so-called First World and Third World were increasing rather than stabilizing.

Dependency Theory; World-Systems Theory

Beginning in the 1960s, a new generation of theorists inspired by the political economy of Marx sought to understand this imbalance of wealth. The economist Andre Gunder Frank argued that, contrary to modernization theory, underdevelopment was not due to the lack of capital but rather to the effects of prolonged capitalist exploitation. Historians of anthropological theory often tie political economy's most recent roots to Frank. Work influenced by his dependency theory illustrated the means by which capitalist colonialism disrupted domestic modes of production, deprived local people of access to resources, dispossessed people of wealth, integrated communities into a global market at a disadvantage, and resulted in the formation of social hierarchies, both local and global. These ideas were further developed in Immanuel Wallerstein's world-systems theory, which viewed wealth creation in the economic cores as systematically linked to the exploitation of the economic peripheries. Through unequal trade relations, this system allowed the world's most powerful countries to subjugate and exploit peripheral nations and thus reproduce and centralize economic and political power.

World-systems and dependency theories were critiqued as abstract neo-functionalism on the grounds that they neglected to consider the value and the meaning of precapitalist economic conditions beyond their function in capitalist accumulation. Furthermore, critics claim that dependency and world-systems views of the capitalist world system were static and structurally deterministic, failing to consider its potential dynamism or the influence of noncapitalist modes of production. A group of French scholars addressed some of these concerns through ethnographic analysis of capitalist integration, the lingering effects of colonialism and the implications of international trade on the lived realities of societies with precapitalist modes of production. Maurice Godelier, Emmanuel Terray, Pierre-Phillip Rey, and Claude Meillassoux are often referred to as the "French articulationists" because they brought attention to the

contradictions and conflicts that occur as capitalist modes of production influence and are influenced by precapitalist economic formations. This dialectical tension and focus on the changing positions of societies in the world economy moved away from the less dialectical and more deterministic materialism of the 1950s, while laying the foundation for a political economy that also considered the ongoing impact of a global division of labor. Together, the French articulationists, Frank, and Wallerstein made important contributions to contemporary anthropological perspectives in political economy. Most important, they grounded the development of culture in history and in global political and economic structures.

As the perspective was further developed in the late 1970s, analyses explicitly labeled "political economy" became increasingly common. One of today's most cited political economists, William Roseberry, marked the official recognition of political economy as a theoretical subfield with the publication of a special issue of *American Ethnologist* in 1978. However, the field remained heterogeneous and often internally contentious, without a unified vision. Some political economists critiqued others for not being political enough or for lacking an adequate appreciation of precapitalist local histories and their influence on contemporary cultural forms.

Critical Perspectives and Postmodern Critiques

In the 1980s, three seminal books in political economy, Eric Wolf's *Europe and the People Without History* (1982), Sidney Mintz's *Sweetness and Power* (1985), and William Roseberry's *Anthropologies and Histories* (1989), addressed many of the previous critiques of political-economic perspectives and helped unify political economy in anthropology. In an era of accelerated globalization and the promotion of free markets by Margaret Thatcher and Ronald Reagan, critical political-economic perspectives flourished, demonstrating the negative effects of contemporary and historical capitalist integration.

Wolf's work in *Europe and the People Without History*, for example, sought to historicize the conditions of some of the world's least privileged people and contextualize them in relation to a long history of global integration. Wolf drew heavily on the work of Marx, Steward, and Frank, viewing society as the product of historical and material processes. However, he also addressed many of the critiques of his intellectual ancestors, integrating a greater sense of dynamism in structures of dependence, a balance of global structure and local agency, and a stronger ethnographic engagement in his analyses. Wolf was careful not to paint his ethnographic subjects as static or only subject to change with the influence of capitalist integration and external domination. His work helped anthropology unbind its conceptualizations of culture and to view it as a dynamic and ongoing process placed in time rather than as a fixed entity. He argued that while societies must be seen in the context of their place in the modern world system, their particular histories cannot be neglected. Wolf gave credence and voice to these histories and the views of the oppressed. His large-scale social analysis thus marked a more dialectical consideration of local and global influence, emphasizing the dynamic nature of culture. Given anthropology's traditional focus on indigenous and noncapitalist societies, analyses of history and power revealed that many cultural forms helped people adapt to and resist oppression and disadvantage within the global capitalist system.

While recognizing the agency of local cultures, political economists in the 1980s led the discipline to increasingly recognize the control that wealthy and powerful exercise, not only on the means of production but also on the production of knowledge, systems of meaning, and our understandings of history. These works drew heavily on social theorists like Michael Foucault, Pierre Bourdieu, and Antonio Gramsci, who illustrated the ability of the powerful to govern the minds of the oppressed by naturalizing the values and practices of the dominant class. Whether referred to as mystification, doxa, or hegemony, these ideas would increasingly prompt political economists to study not only the material base but also symbolic systems of rank and power that illustrate how the powerful control knowledge production and naturalize disadvantage. With this growing recognition, anthropologists began to question their own ability, as products of privileged social locations, to objectively or accurately represent the perspectives of less powerful others. While the influence of postmodernism is often viewed in opposition to the materialist perspectives that characterize political economy, both threads helped inspire a period of reflexivity.

During the 1980s and 1990s, there developed a heightened concern for situating anthropological analyses in the everyday lives and perspectives of anthropological subjects. Moving beyond economic

reductionism and structural determinism, political-economic analyses influenced by these concerns gave more voice to the people they studied and more analytical attention to the means by which people actively interpret, resist, or subvert the demands of capitalist production and its associated ideologies. Michael Taussig's classic work with miners and plantation workers in South America, for example, illustrated how these workers gave meaning to the contradictions of capitalist production and critiqued the commodification of their labor. At the same time, political economy was continuing to broaden beyond purely class-based analyses to consider other locations of social, political, and economic inequality. Inspired by the work of Eleanor Leacock, June Nash, and later Carla Freeman, feminist political economists would continue to analyze the gendered division of labor, the unpaid work of household reproduction, and the creation of gender inequality in the context of colonization and development programs. Other scholars examined the impact of racial discrimination in the workplace and the ongoing legacy of slavery and colonialism.

Recent Developments

Leading up to and around the turn of the 21st century, political economy came to be increasingly influenced by theories of practice and critiques of structural determinism leveled by interpretive anthropology. While the theoretical subfield remains heterogeneous and broad, integrating an array of subjects, methodologies, and sites, it has responded to critiques of structural determinism and vulgar materialism with a generalized attempt to balance consideration of structure and agency, the global and the local, and of the material structure with superstructure. As prominent political economist Paul Durrenberger has recognized, it is impossible to view the economic system as separate from other aspects of society or as impervious to social and political influence.

The influence of political economy on contemporary anthropology is evident. While its influence is perhaps most prevalent in studies of globalization and development, contemporary political economy in anthropology is concerned with a broad array of topics. From Philippe Bourgois's analysis of the international economic factors that lead to the structural violence against homeless drug addicts to Aihwa Ong's analysis of the links between an individual's market value and notions of citizenship in neoliberal regimes of global competitiveness, the influence of political-economic perspectives is clear. Regardless of the topic, work inspired by political economy continues to remind anthropologists that analyses of culture are incomplete without a consideration of history, power, and ideology.

Popper, Karl

Sir Karl Raimund Popper (1902–1994), an Austrian British social and political philosopher and philosopher of science, is significant in anthropology for his ideas on methodology, on knowledge and consciousness, and on liberalism and morality.

Biography and Major Works

Karl Popper was born in Vienna on July 28, 1902, as the youngest child of parents of Jewish origin. His home environment was bookish: Interests in law, the classics, philosophy and social and political issues, and music were inculcated. Popper was educated at the University of Vienna, studying mathematics, music,

psychology, physics, and philosophy. He obtained a primary school teaching diploma in 1925, earned a PhD in philosophy in 1928, and qualified to teach mathematics and physics in secondary school in 1929 (teaching between 1930 and 1936).

The growth of Nazism in Germany and Austria led him to emigrate in 1937, becoming a lecturer in philosophy at Canterbury University College, Christchurch, New Zealand. In 1946, he became a reader in logic and scientific method at the London School of Economics and Political Science (University of London), was promoted to professor in 1949, and retired in 1969. He was knighted in 1965, elected Fellow of the Royal Society in 1976, and made a Companion of Honour in 1982.

Three of Popper's major works appeared between 1935 and 1945. *Logik der Forschung* (1935, appearing in English as *The Logic of Scientific Discovery* in 1959) was a theory of science. "The Poverty of Historicism" (1936, later updated and published as a book in 1957) applied the theory of science to history and society and critiqued the Marxian notion of historical laws. *The Open Society and Its Enemies* (1945, two volumes) treated the history of liberalism as a form of open thought and society contrasted with the closures of authoritarianism, fundamentalism, and totalitarianism.

Popper's major later works included two collections of papers, *Conjectures and Refutations: The Growth of Scientific Knowledge* (1962) and *Objective Knowledge: An Evolutionary Approach* (1972); an autobiography, *Unended Quest: An Intellectual Autobiography* (1976); a collaboration with John Eccles on the mind/body problem, *The Self and Its Brain: An Argument for Interactionism* (1977); as well as *Postscript to the Logic of Scientific Discovery* (1982–1983) and *The Myth of the Framework: In Defence of Science and Rationality* (1994). He remained active as a writer, broadcaster, and lecturer until his death in 1994. His manuscripts and correspondence are now archived at the Hoover Institution, Stanford University.

Contribution to Anthropology

Central to Popper's thought is a challenging correspondence he would draw between "openness" in scientific practice and openness in society; good science and good society—moral, free, liberal—flourish under comparable conditions.

Popper argued for human life to be understood as primarily a process of solving problems (and hence making meaning) in changing environments. Such problem solving entailed conscious attempts to extend an understanding of experience by the use of the creative imagination, which was then subjected to critical control. Whether expressed in an idiom of art or science, through means rational or irrational, empirical or intuitive, a constancy of experimentation engaged anew with the presently unknown and constructed order. Hence, it was the essential character of all human thought to be revolutionary, and Popper was pleased to describe the human brain as an open system of open systems. What problem solving achieved was an approach nearer to the truth. Even though we may never know with certainty what was true, we could know, absolutely, what was not true: We could differentiate between competing theories and learn from mistakes. This was a process not only of scientific advancement but also of moral improvement, for humanity could improve on its relation to itself and its environment and thereby hope to lessen suffering.

The scientific and the moral best came together in a particular type of society that Popper called open and whose best recent representation, since its origin in ancient Greece, was in Western liberal democracies. An open society ideally made every source of knowledge admissible—imagination, tradition, reason, and observation—while none was held to be authoritative in the estimation of future action and none was immune from criticism. Knowledge continued to be treated as a hypothesis to be empirically tested and then corrected, while every executive or administrative policy and decision was a speculation to be subjected to rational-critical debate. Power, moreover, was held for strictly limited purposes: for the maintenance of free institutions and for intervening in social life—providing education, housing, health, and so on—so as to extend the range of individual choice.

What characterized such liberal societies, above all, was an attitude of criticism whereby a diversity of often incompatible worldviews was openly expressed and conflicting aims pursued. For when it was recognized that everything was actually disposed to imaginative construction, experimentation, and change, any truth was expected to be partial. It was not the case, then, that the open society simply replaced one absolutism, religion, with another,

criticism. For it recognized that there existed no general criterion of truth that could save humanity and that criticism was neither infallible nor finally authoritative since it was human.

The ideal open society was to be open in two significant ways, then. It was open scientifically, embodying an environment in which the exploration of the world through theory and experiment, and the accumulative acquisition of knowledge, took place without institutional or ideological hindrance. Only by conducting scientific exploration that avoided the closures of doctrinal and conventional truths, of normative and fashionable expectations, and of comforting and habitual teleologies and tautologies could humankind continue along the progressive path of accruing knowledge that more closely approximated to the nature of reality. The open society was also open politically and socially; it practiced a form of government and of civility that afforded space and opportunity to individual citizens to make their own explorations of life and draw their own conclusions concerning how it was to be lived—and it prided itself on so doing. The open society respected the integrity of the individual and also individuals' capacity to make sense: to accede to an understanding of self and the world that accorded with their own needs and desires, with their will, and that represented an appositely authentic and dignified way for those individuals to conduct themselves.

The gaining of scientific knowledge of the world and of individual knowledge of "self in the world," entailed similar processes, Popper claimed. One began with conjecture—with an imagined theory, a story, a poetic framework, a speculative paradigm—concerning what the world or self might or could be like. One put one's conjecture to the test, experimenting with one's ideas by enacting them, living them, and critically assessing the results. Were the results valuable? Did they better one's capacity to control life and self? Did they increase the possibility that one could ensure order, regularity, and pattern in one's environment—that one could appreciate how order might be ensured in the world? In light of one's experimenting with and criticizing an initial theoretical conjecture, one improved continually on the inevitable prejudices—the constructions and anticipations of the world—by which one lived.

Crucially, Popper contended that the two kinds of openness, scientific and sociopolitical, were linked. A society that was open scientifically afforded sociopolitical improvement, while a society that was open sociopolitically afforded scientific improvement, and the two kinds of openness mutually assisted one another; openness in one sphere spilled over into the other. It was the case, therefore, that one might expect better science in a liberal democracy, where the practice of social questioning and critique was safeguarded, than in a totalitarian society, where it was not; also, one might expect better politics in a milieu where there was a general, scientific questing after the ways of nature than in a world of preordained and revealed knowledge, where it was not. And the converse was also true; minds that were closed theoretically, that inhabited a straitened and dogmatic world of ideas, would not at the same time celebrate notions of civil freedom.

As Popper painted it, then, the distinction between such closed and open societies was a very stark one; nor was there any question, for him, as to which was superior. An open society, which upheld equalitarian and individualistic principles, which afforded every person the right and the opportunity to model their life as they saw fit (to the extent that this did not interfere with others' lives), and which encouraged individual initiative and self-assertion, was the means of every advance in knowledge, reasonableness, mutuality, and chances of human survival.

Taken to its most challenging conclusion, moreover, Popper's coupling of science and democracy proposed that there might be ways of linking "is" and "ought": how the world actually was and how the world ought to be lived. For if it was good that humankind improved on its understanding of the universe and its place within it and, thereby, also on its ability to affect its chances of survival, and if this science could be linked to a particular way of life, then science, its conducting and its results, could provide a moral vision, ranking ways of life and suggesting a good way to live. At the least, Popper suggested that the process of undertaking good science provides insights of a moral, political, and social kind into the good life. In short, not only could science be seen to supersede supernaturalism and religion in answering the "what" question about the universe—"What is the universe like?"—but it also could be seen to supersede religion in answering the "why" question—"Why should one behave in one way and not another in the universe?"

Notwithstanding, Popper recognized that the open society had its detractors, its difficulties and

tensions, and has had them throughout history. For the realities of openness could be an atomistic social milieu of insecurity and change; conventional authority could feel threatened by new solutions, and individuals could suffer from alienation and anomy, hence the historical tradition running parallel to the open society: the closed society. Reacting against the open society and finding its costs—experimentation and change—too much, this latter society would prescribe a form of closure that arrested openness in favor of a coercive (Utopian) totalism. Popper saw ideologies of such "tribalism" as beginning with Plato and extending through Marx to contemporary religious fundamentalisms. A closed society pursued a communitarian rather than a liberal ethos, valuing the continuation of the society per se over the nurturance of its individual members; the critical diversity and play of the individual mind were exchanged for uncritical certainties and monolithic social ends. Here, too, submission to magical forces and a rigid conventionality substituted for rational attempts at human improvement; religious or mythical truths justified hierarchical and conservative relations of authority maintained by ritual and taboo.

Popper remained a humanist. To equate human beings with machines or with products of processes of manufacture—whether natural or sociocultural—is to deny or misconstrue the existence of mental phenomena, and consciousness or personal experiences more generally. It was to reduce selves to mere epiphenomena of events and to treat the world as a closed, self-explanatory structure. That is wrong both morally and empirically. Morally, it ignores suffering and the significance of the human fight against brute materiality (culminating in the conscious facing of death). Empirically, treating human beings mechanistically (or deconstructively) means to ignore their cognitive power, through speculation and experimentation, both to construct environments for themselves and to transcend those and construct anew. The desire to abdicate one's freedom so as to escape the responsibility of having to make choices and decisions, and of living with the consequences—as in a closed society—represents a victory for the immature plane of human nature.

Popper's Legacy

Popper's thought is controversial in anthropological circles that promote cultural relativism and methodological holism; not all are persuaded by the downplaying of the role of sociocultural construction in favor of an individual experimenter transcending cultural and historical givens. But there have been committed engagements and evaluations of Popper's work. Ernest Gellner described himself (in *Anthropology and Politics*, 1995) as a "good Popperian," esteeming Popper as, together with Willard van Orme Quine, the greatest living philosopher. In considering how anthropology might partake in a debate on civil society and its moral dissemination, Gellner rated *The Open Society and Its Enemies* as one of the two key texts of 20th-century liberalism (the other being *The Road to Serfdom* by Friedrich von Hayek).

The project of any adequate anthropology, Gellner elaborated, is underwriting a supracultural morality for a cosmopolitan world of movement. This must encompass a social scientific understanding of human liberty: granting the symbolic worlds of cultural fraternities a respected place in a scientific universe, while also ensuring individual equality a securer foundation than either communitarian whim or laissez-faire consumerism alone. While allowing that a symbolic domain alongside the technical one of science may continue to be necessary for human comfort, Gellner concluded that this domain might nevertheless be expected to reflect universal lineaments and be ultimately subject to reason.

In this, Gellner was extending the ruminations of another Central European and liberal, Bronisław Malinowski. In *Freedom and Civilization* (1947), Malinowski imagined the seemingly self-contradictory vision of cultural belonging (ethnicity, religiosity, and nationalism) set in a situation of universal government. If the inevitable consequences of cultural and communitarian belonging—from exclusivism to colonialism to genocide—were morally repugnant, Malinowski reasoned, then the solution was a League of Nations, a supranational government, by which all would, in effect, be colonized. Social groupings would surrender their claims to territorial and political sovereignty, while their cultural independence and vitality might be ensured. By differentiating culture from territory, the same land could come to accommodate different forms of life. This was the only humane solution to the complexity of the ethnic map, to mutually incompatible nationalistic claims to territory, and to demands for community without the attendant tyrannies, oppression, or loss of life. An open society might thus

colonize those domains of ethnocultural exclusivity while at the same time protecting individuals' rights to belong.

Postcolonial Theory

Postcolonial theory addresses the effect of colonialism on culture. Initially associated with literary analysis, in the 1970s, postcolonial theory focused first on Western colonial discourse, showing that colonial power took shape in areas of life such as literature, which are not initially obviously political. But other founding contributors to postcolonial theory, especially historians, urged the study of the histories of colonized people and their experience of colonialism. Anthropology's and history's engagement with postcolonial theory has broadened attention to the agency of the colonized, to resistance, and to postcolonial consequences.

Cultural anthropology and postcolonial theory share many analytic and reflective questions. As postcolonial theory extended its moral and political challenge, it provoked anthropologists and historians to question whether their fields, like literature, had underestimated colonialism, overestimated Western culture to be universal, and neglected colonial domination and its effects. While anthropologists have long been champions for others and skeptics of the West, and its ethnocentrism and racism, until the rise of postcolonial theory, they had not developed a sustained critical inquiry into colonial processes. But anthropology also offers challenges to unexamined assumptions in postcolonial theory. In particular, anthropology questions the periodization implied in the term *postcolonial*, which implies an open-ended era defined by past Western domination. Most important, anthropologists have identified new ways to think about and name the postcolonial era, including a focus on nation-states, decolonization, globalization, and plural modernities.

Orientalism and Subaltern Studies

Postcolonial theory began with scholarship on colonial era texts. Edward Said's *Orientalism*, published in 1978, which inspired much of postcolonial theory, critically analyzes the writings of orientalists. "Orientalists" were 18th- and 19th-century scholars, travelers, novelists, and colonial officials who focused on the Islamic world as "the Orient." Said, a scholar of comparative literature, argues that literary and textual representations of this imagined Orient contributed integrally to Western political and economic domination of Asia and the Middle East. Indeed, Said argues that 18th- and 19th-century Orientalists were part of a larger, Western colonial discourse about the Orient, stretching from the ancient Greeks to contemporary U.S. policymakers. Furthermore, he argues that Western discourse about the Orient created a powerful, unanswerable portrait of the Orient as ancient, weak, and irrational, effectively silencing the object of its study. He suggests that similar dynamics underlie all the relations between the West and all the colonized peoples of the world.

In writing about colonial discourse, Said drew on theorists who brought together theories of meaning and consciousness with theories of power. The term *discourse* is drawn from the work of Michel Foucault and is used to describe overarching, powerful, systematic understandings of the world. Said saw "Orientalism" as a hegemonic discourse. *Hegemony* is a term drawn from a Marxist tradition (begun by Antonio Gramsci and continued most notably by the literary theorist Raymond Williams) that seeks to understand the role of naturalized understandings in the reproduction of social inequality. Both discourse and hegemony assume that people in particular societies, or particular historical eras, have shared

categories of understanding, what anthropologists would define as shared culture. But unlike the culture concept, both hegemony and discourse theory portray these understandings, which structure beliefs, practices, and institutions, as sinister at heart and laden with power relationships. The differences they establish and maintain serve to naturalize and perpetuate inequalities. Postcolonial theory explores colonial discourse, relating it to wider powerful discourses about gender and about class and race, showing the powerful, constructed cultural understandings that animate the colonizers. Social orders are shown to be profoundly unequal. Postcolonial theorists take as their task the exploration of the role of culture (systems of meaning) in perpetuating that inequality. They fundamentally changed the ethical priorities for the study of culture, adding a concern to address power dynamics to inquiry into expanding knowledge of cultural possibilities.

Said's work reframed studies of colonial era literature and scholarship, leading to many demonstrations that colonial inquiries that seemed to be in search of knowledge and works that seemed to be knowledgeably descriptive were in fact reinforcing preexisting representations and colonial domination. For some postcolonial theorists, the message was that knowing itself is inextricably part of a colonial project. Most famously, Gayatri Chakravorty Spivak asks, "Can the subaltern speak?" She argues that, because of the power of colonial discourse, some colonized or otherwise subjugated people literally cannot represent themselves. Ironically, as many have observed, some postcolonial theory risked overvaluing the power of powerful colonial discourses. Yet nuanced studies, such as the work of Ashis Nandy, show colonialism to be an "intimate enemy," infiltrating the consciousness even of anticolonial figures. Nandy focuses not on Western texts but on the lives and texts of people living under colonialism, analyzing their writings and careers, showing the possibilities for adapting, inverting, and challenging colonial impositions in the course of creating new social and political visions.

The most influential early anthropological contribution to postcolonial studies was Talal Asad's edited volume *Anthropology and the Colonial Encounter*, which was published in 1973. In a chapter on two European views of non-European rule, Asad shows that Orientalist scholars portrayed Islamic polities as ruled by irrational despots who subjugated a repressed, passive populace, while British functionalist anthropologists writing about African political systems portrayed African polities organized through a self-reproducing consensus between chiefs and the people. Asad challenges these representations by discussing the local histories (of popular rebellions in Islamic polities, of dynamism, not stasis, in southern African kingdoms) that belie the scholarly stereotypes. He shows that the roots of these different representations lie in the differing underlying political and economic relations between the scholars' own societies and the societies whose political systems they describe. He makes a powerful case for anthropological analysis of the impact of such historical relations on scholarly representation. In a different vein, the anthropologist Bernard Cohn's studies of the colonial British in India describe powerful British colonial projects, but a much less determining colonial footprint, tracking the complex interactions between British and South Asian institutions and knowledge systems.

The subaltern studies school opened a new mode of inquiry in postcolonial theory in the 1980s. The subaltern studies collective is a group of scholars of South Asian history and historiography, some of whom had begun with political-economic approaches to South Asian history. However, where Marxist theorists would approach people's experiences, motives, and possibilities through an analysis of class relations, the subaltern studies scholars seek a more flexible way to understand experience and characterize indigenous and colonial inequalities. The terms *elite* and *subaltern* are relative. In relation to the colonial British, all Indians were subalterns, but landlords or factory owners, British or Indian, were elites relative to peasants or workers. Like Said, the subaltern studies group critiques the assumptions of colonial histories and, further, the elite assumptions of nationalist histories. But they also proposed that it is indeed possible to write the history of colonial and postcolonial "subalterns." In particular, they sought to research understandings and critiques not shaped by colonial influence, because of resistance or social distance or both. Oral history and critical readings of colonial documents were among the methods for bringing these histories to light: Ranajit Guha pioneered a critical approach to "the prose of counterinsurgency," reversing the meanings of colonial descriptions of subaltern rebellions. Shahid Amin found in local newspapers,

police reports, and oral history differences between what Gandhi said and what the subalterns heard. In this way, the contributions of initial subaltern studies to historical research articulated with the 1980s rapprochement of anthropology and history. At that time, historians in general turned to social history, and anthropologists developed an interest in historical agency. Some anthropologists focused on history making as local, culturally distinct forms of dynamism (as advocated by Marshall Sahlins's structure-and-history approach), while others such as Eric Wolf and Sidney Mintz viewed historical change in the context of world-system relations. In either approach, like the initial subaltern studies approach, the focus was on acknowledging and chronicling plural distinctive historical experiences and agencies.

Within the subaltern studies group, Spivak developed a critique, congruent with that of Said, of the politics of representing the experience of colonized or subjugated people. But others in the group wrote works representing the historical experiences of colonized and postcolonial subalterns. In this approach, and for many others in postcolonial studies, inquiry is couched as the study of colonial hegemony and resistance to hegemony, and such studies assume that no hegemony is ever complete. Resistance to hegemony is to be expected and can be studied. Indeed, studies of resistance to colonial or other forms of power became pervasive, complementing the focus on colonial discourse. The anthropologist Sherry Ortner reflects seriously on the widespread use of resistance as an analytic, placing it in the context of anthropology's ethnographic contributions and goals. Surveying both resistance analyses and critiques, she shows that the focus on resistance tends to ignore complex indigenous political systems in favor of a focus on Western power, that it can emphasize political-economic histories rather than appreciating local ethnographic realities and that its roots in textual study can lead to thin portrayals of what anthropologists often find to be richly contextualized cultural motives and intentions. (The anthropologist Clifford Geertz once defined good ethnography as "thick description.") Ortner ponders the question of whether the subaltern can speak, suggesting that respectful inquiry into motivations and agency is possible and that thickly descriptive inquiry and representations are possible. Other ethnographers argue, with Spivak, that subaltern peoples do not have the power to represent themselves the way elites can.

Within the humanities disciplines, postcolonial theory has also moved to become the study of contemporary literary and cultural works by non-Western authors, whether living in the former colonies or in former imperial centers. For many scholars, the enduring question is how to form an identity, voice, or subjectivity either beyond the powers of colonial discourse or effectively responding to it. Another development in the literary field has been the consideration of non-Western colonial powers (e.g., Japan) and their histories and resistances to them. Work in comparative literature has also opened up questions about Occidentalism, whether the reified representations of the West have been created by non-Western observers or by Westerners themselves. Does the project of Orientalism create a concomitant representation of Westerners as modern, powerful, and knowing subjects? Some see what anthropologist Arjun Appadurai named "modernity at large" as the end of colonial domination, while others see a renewal of colonialism in a new ideology of modernity.

Reframing Postcolonial Theory: Nations, Decolonization, Globalization, Modernities

A serious question for scholars of postcolonial theory themselves, and a common observation from outside the approach, is the problem of the primacy given to the colonial and the West by the use of terms such as *postcolonial* or *non-Western*. Even the study of anticolonial resistance can be seen as organizing the boundaries of the inquiry within colonial categories. The debates about knowledge and power and the possibilities of writing ethnographically and historically raised by postcolonial theory articulate well with cultural anthropology's long-term commitment to reflexivity. But anthropologists also bring questions that have reframed some of the terms and questions of postcolonial theory, beginning with the term *postcolonial* itself. Anthropologists have questioned the periodization implied in the term *postcolonial*, which implies an era unendingly defined by an era of Western domination. Most important, anthropologists have identified new ways to think about and name the postcolonial era, including a focus on decolonization, nation-states, globalization, and plural modernities.

The postcolonial era can be differently conceptualized through a focus on nations and nationalism, the political forms of anticolonial movements and of the postcolonial era, and their cultural concomitants. The interest of the humanities and social sciences in nations and nationalism was rekindled by Benedict Anderson's *Imagined Communities*, which considered national citizenries as "imagined communities." Anderson's language of imagination provides scholars from many fields, including literary, visual culture, and cultural studies, a way to address how people come to understand themselves as being a part of a national entity. Like the studies of colonial discourse, studies of national imagining raise questions of hegemonic ordering of people's understandings. But the study of national belonging, in Anderson's approach, also implies participation in a more egalitarian political entity. He argues that print capitalism, that is, shared consumption of texts, from newspapers to novels, led to shared national identities, a sentiment of shared time and space among people who would not in fact ever meet. Anderson explored the creation of this clearly horizontal national imagination in the Americas and in Europe. He then described the making of nations in the former colonies as exportation to the colonized world of a modular nation-state form. Like Said's *Orientalism*, Anderson's *Imagined Communities* has been criticized for its assumptions about the power of the West to impose its model on others. Historian Partha Chatterjee pointed out the irony of an approach that proposes that powerful nationalist, anticolonial movements need to be understood as the adoption of an already European modular political form.

More recently, other scholars have followed Bernard Cohn's suggestion to augment studies of European colonialism with attention to the study of the rise of American power in the 20th century. This approach reconsiders postcoloniality in relation to actual decolonization and the breakup of empires. Prior to World War II, empires were the predominant political form throughout the world. Even ostensible "nations" like England were also solidly and inextricably a part of an empire. After World War II, successful anticolonial liberation movements throughout the colonized world had to find their way in the American-planned global system of independent nation-states and were arrayed in a United Nations world. Both England and England's former colonies became individual nation-states. And in this Cold War era, the United States surpassed the former European powers.

Many scholars connect analysis of U.S. power with the analysis of European colonial power (e.g., contributions by the anthropologists Donna Haraway and Vicente Rafael appear in a recent multidisciplinary volume titled *Cultures of United States Imperialism*). Some, writing from a political-economic perspective, call U.S. power in the post–World War II era by the terms *neocolonialism* and *neo-imperialism*. Some, focusing on discourse, emphasize continuities between European colonial discourse and U.S. discourse, seeing Western Orientalism or hegemony as continuous, as Said did in *Orientalism*. They describe U.S. imperialism. In contrast, others reconceptualize the political and cultural trajectories of the world of nation-states, taking independence as real, with egalitarian goals, and also limited liability for the Western powers. They call this new world order "Pax Americana." For example, the anthropologist John Kelly analyzes the emergence of Pax Americana in a study of decolonization-era leaders and scholars who fought against empires but who also saw different dangers in U.S. power and the form of the nation-state. In the 1920s, Mahatma Gandhi's nationalism was highly internationalist, anticipating Indian independence as ushering in an era of international justice and interdependence. In the 1950s, Frantz Fanon warned of the vulnerability of small independent nation-states to capitalist exploitation. As global inequality increases and poverty spreads in many nations, scholars focused on the particular political forms of the post–World War II era see not imperialism as practiced in the past but new, specifically postcolonial predicaments, for which further decolonization cannot provide the solution, since it is the nation-state form that is the problem.

Continuing debates about the era after the end of the European empires have also led to a focus on modernity, alternative modernities, and globalization. The questions about modernity follow from observing the organization of postcolonial economies and cultures. The global connections of the European colonial world had featured imperial centers and colonies, an unequal but enduring hierarchy of colonizers and colonized, in which the colonizers believed themselves to be civilized or modern and considered the colonized as ancient or traditional. Even following independence, colonial

influences remain to be resisted. On the other hand, the post–World War II, postcolonial emergence of an era of separate, independent, bounded nation-states created a postcolonial baseline that made cross-boundary influence and interconnection a violation of self-determining sovereignty. But in this context, the late-20th-century rapid interconnections in global popular culture, facilitated by new technologies and capitalist interests, seemed startling. Some anthropologists, emphasizing the independent initiatives of non-Western societies in making their own choices in combination for their global future and local past, see the emergence of plural and alternative modernities, while other anthropologists, emphasizing one uneven history of capitalism, still see one globalizing modernity. Either way, as Appadurai has argued, modernity is no longer the attribute of the West, but rather, modernity is at large in a world of plural centers and sites of power. Scholars now debate whether globalization is ending postcoloniality, whether it is in fact a new form of empire, or whether it is the inevitable progression of decolonization as people push against the limits of the nation-state.

POSTMODERNISM

Postmodernism is a controversial philosophical, aesthetic, and cultural formation that has influenced culture, literature, art, and the social sciences, including anthropology.

Foundations

Postmodernity generally refers to a period beginning in the 1980s (sometimes also referred to as late capitalism) in which radical changes in technology, economics, politics, architecture, and popular culture signified a shift in society—a movement away from modernity. Some thinkers, including Daniel Bell, have denoted this period as a time of postindustrialism. Massive changes in the nature of economics (e.g., the movement toward multinational corporations), transformations in government, alterations in technology and information systems, the development of a media-based society, and changes in consumerism can all be attributed to this epochal shift that has been labeled *postmodernity*. In a cultural sense, postmodernity often refers to a period in society in which hyperreality and cultural eclecticism are the norms. Hyperreality is associated with the work of Jean Baudrillard, Umberto Eco, Guy Debord, and others and suggests that culture has become inauthentic mainly because people seem to lack the ability to distinguish between the "real" and the "fake" or "fictive." In 1984, philosopher Jean-François Lyotard offered that eclecticism is the natural state of contemporary culture—people eat various foods, reflect contrasting and contradictory tastes in fashion, and shop, consume, and take in numerous and divergent *memes* or sources of information.

In addition to being thought of as a social or cultural period, postmodernism also, somewhat ambiguously, refers to myriad philosophical, epistemological, aesthetic, and cultural styles, modes of thoughts, and worldviews.

While the meanings of postmodernism vary greatly, the concept suggests a radical reformation, an opening up of new lines of inquiry, and a general distrust of the sanctity of systems of knowledge (Truth) and forms of representation. Pastiche, the breakdown of high and low cultures, eclecticism (the blending of styles and forms that are incongruent), the breakdown of rules, non sequitur, irony and humor, resistance to authority and systems of power, the breakdown of the referent in semiotics, double coding, endless signifiers, indeterminacy, performativity, and the notion of the unrepresentable are some of the many concepts that are indicators of the postmodern.

Some of the most powerful influences of postmodernism arose within the world of aesthetics, popular culture, and media. In the world of literature, Samuel Beckett, James Joyce, William S. Burroughs, Thomas Pynchon, Jorge Luis Borges, Alfred Jarry, Kurt Vonnegut, Italo Calvino, and many others have been credited with introducing new modes of authorship that, perhaps indirectly, influenced the ways in which anthropologists and social scientists have thought about writing. In a similar sense, within the world of performance and music, artists such as John Cage challenged the notion of the authorship of the work of art. In Cage's mind, the chance operations of the *I Ching* could imitate the apparent randomness of nature and thus move the composition away from the composer's ego. Larger scale musical movements, such as punk, attacked another facet of culture—the idea of high culture. In the case of punk, anyone, literally, could be an artist. Punk drew on many of the cultural influences begun in movements like surrealism, Dadaism, Fluxus (an art movement that focused on anti-art, process, and everyday life), and other forms of performance and conceptual art. What was significant in these movements was the rejection of current modes of aesthetics, politics, and culture and the suggestion of radical new ways to approach the world.

The work of visual artists, including Marcel Duchamp (1887–1968), Joseph Beuys (1921–1986), and Andy Warhol (1928–1987), also drew attention to new modes of representation. Some of these were so jarring that they continue to exemplify what the art historian Robert Hughes has called the "shock of the new." Many visual artists have moved away from art equating with beauty, the sublime, or the genius of the individual artist to creating art that privileges parody, bricolage, pastiche, and anarchy and negates the power of the work as residing in the artist in favor of a more participatory understanding of art. The influences of artists like Duchamp, Beuys, and Warhol can be felt well outside the worlds of art. Like the other cultural influences considered here, these artists influenced the ways in which social scientists and others thought about the world and its representation.

Technological developments, especially those related to the media and forms of consumerism, have also laid a foundation for postmodernism. The montage effects of MTV music videos, much like the montage of surrealism and Dadaism, transformed the sensibilities of the viewers of media. In the world of architecture, a number of significant developments have also influenced postmodernism. Architects such as Robert Venturi (1925–) transformed the nature of architecture by developing what Charles Jencks, in 1977, noted as a double coding within the field. Architecture became more eclectic, often combining multiple styles in structures that, like the hermeneutics of Jacques Derrida, pointed to multiple interpretations. These cultural tendencies, along with the radical political upheavals of the 1960s, affected the cultural world to such a degree that they necessitated shifts within academic disciplines, including anthropology. This spirit of cultural radicalism had considerable impact on the lives of anthropologists and the academic institutions in which they taught, and anthropology, at least at the margins, began to embrace postmodern tendencies.

From within the history and philosophy of science, a number of developments have influenced the postmodern tendencies within anthropology. Thomas Kuhn's (1922–1996) conceptualization of the idea of the paradigm shift in his influential *The Structure of Scientific Revolutions* suggested that even within the most stringent empiricist and positivistic traditions of science, revolutions were likely to take place. His notion that illogical events could lead to scientific discoveries echoes the postmodern sensibilities of Paul K. Feyerabend (1924–1994), who, years after Kuhn, focused on an anarchistic philosophy of science that often advocated an

"anything goes" principle that strongly contradicted the logical approaches of empirical science. In terms of scientific disciplines, chaos theory (with its emphasis on the role that indeterminacy plays in natural phenomena) and quantum mechanics (with its focus on counterintuitive principles of reality) may have influenced some of the general tendencies of theoretical postmodernism.

Some of the most significant impacts on the development of postmodernism arose from the field of philosophy. The work of Friedrich Nietzsche may be the single greatest influence on postmodernism. His use of aphoristic style in works like *Human, All Too Human* established Nietzsche as a thinker who could not be easily categorized, and his exceptionally critical focus on society, value systems, and philosophical systems of thought (especially metaphysics) established a new precedent for critical philosophy. Perhaps his most important influence on postmodernism was his assertion that Truth was simply a form of illusion that people had forgotten was an illusion. This notion would provide ample grounds for the later critiques of Truth in the work of Baudrillard, Derrida, Foucault, and Lyotard. Equally significant in terms of their impact on postmodernism are Søren Kierkegaard and Martin Heidegger. Kierkegaard's critique of the rationalism of life and its impact on the individual and his attempts to radically rework Christian thought, as well as Heidegger's focus on the question of being and his views on the impacts of mass society on the individual, provided a strong foundation for postmodernism's insistence on a "war on totality," in Jean-François Lyotard's memorable phrase. In the years that followed these philosophers, the works of Walter Benjamin (especially his work "The Task of the Translator" and "The Work of Art in the Age of Its Mechanical Reproducibility"), Michel Foucault (notably for his focus on the nature of power and institutions), Jean Baudrillard (for his understandings of hyperreality and postmodern semiotics), Gilles Deleuze and Félix Guattari (who collaborated on many texts that took a postmodernist or "nomad" approach, e.g., *A Thousand Plateaus*), and Lyotard (whose *The Postmodern Condition: A Report on Knowledge*, 1984, established the most significant contemporary foundations of postmodernism) all influenced the development of postmodernism.

In semiotics and hermeneutics, one of the primary forces that shaped the textual and representational foci of postmodern anthropology is found in the work of Derrida. Derrida's notions of deconstruction, *différance*, and the eternal play of signifiers profoundly influenced the ways in which postmodernism would be developed within anthropology. In interdisciplinary senses, other significant schools of thought that had an impact on postmodernism include the Centre for Contemporary Cultural Studies and the Frankfurt school.

One of the most challenging aspects of postmodernism is the enormous variation in the ways the concept has been understood, applied, and debated. For some, the term *postmodernism* is nothing more than a buzzword—an empty signifier of loosely connected concepts in culture. For others, the concept has significant meaning, but due to its revolutionary nature, it, much like conceptual or avant-garde aesthetics, eludes clear meaning and definition. Others argue that the term is an inadequate way of dealing with the various forms of newness that appear in art, politics, science, and other fields. In this sense, whatever is new is postmodern, perhaps because it still has not been conceptualized. Robert Pool in his 1991 essay "Postmodern Ethnography?" argues that many anthropologists have been lumped into the camp known as "postmodern anthropology" but that the concept is a *shibboleth*—a term that means much to the many critics of "postmodernism" but offers little insights in terms of actual meaning.

Critical Contributions to Anthropology

The influences of postmodernism on contemporary anthropology fall into three general trends. The first is an epistemological tendency that challenges the Enlightenment, empiricist, and positivistic assumptions of a knowable reality and reliable, truth-seeking methodologies. The second is a linguistic/hermeneutical tendency that attacks the assumptions of the omnipotence of the author and the final authority of the text, as well as the notion that the text can objectively represent various phenomena in the world. The third and final one is a political tendency that takes issue with the apolitical assumptions of science and methodology and posits a more political course for social science. These three tendencies have intermingled and have been realized in eclectic, contrasting, and sometimes ironically contradictory ways in anthropology.

Postmodern Anthropology

The most well-known of the forms of postmodernism that have taken root in anthropology appear in cultural anthropology. Beginning in 1986, a series of critical texts helped establish the foundations of this tendency—*Writing Culture: The Poetics and Politics of Ethnography* (edited by James Clifford and George Marcus), *Anthropology as Cultural Critique: An Experimental Moment in the Human Sciences* (George Marcus and Michael M. J. Fischer), *The Predicament of Culture: Twentieth-Century Ethnography, Literature, and Art* (James Clifford), and *The Unspeakable: Discourse, Dialogue, and Rhetoric in the Postmodern World* (Stephen A. Tyler). Some have labeled this focus as a form of meta-anthropology, which perhaps accurately captures the spirit in which this critique turns anthropology on itself. Many, if not most, of the anthropologists connected to these developments would disavow the use of the term *postmodern*. However, this term has stuck and has, for better or for worse, become the moniker that resonates most with the critiques of anthropology that emerged in the late 1980s.

Postmodern anthropology may be characterized in terms of three major impacts. First, it is an epistemological critique of knowledge that challenges the assumptions of West-centric, positivistic, and unproblematized forms of knowledge. Next, it is a challenge to anthropology's methodologies (fieldwork), its view of the relationship of the anthropologist to the observed, and the connections of fieldwork to the text (ethnography). Last, it is the explicit critique of ethnography—the nature of textuality, its politics, its disciplinary position within anthropology, issues of the specific form and modes of the text, the voice of the ethnographer, and the role of the informant within the text.

In terms of the first area—the epistemological critique—this focus, much like the foci of postprocessualism and feminist anthropology, addressed the nature of knowledge production within the discipline. Some major tenets of the past—the model of the static social structure, an uncritical and often reified view of culture, archaic typologies (band, tribe, chiefdom, and state), and the emphasis on the culture area paradigm—were explicitly and implicitly challenged by postmodernists. Especially relevant, though related more explicitly to the second and third critiques, was the concern with positivistic and scientific views of culture that gave the field-worker an omnipotent status. Many cultural anthropologists, like their processualist counterparts in archaeology, failed to question their status in anthropological knowledge production and instead assumed that culture, and its people, could be objectively understood. In addition, many theoretical specializations—such as structural functionalism, cultural materialism, cognitive anthropology, and cultural ecology—were challenged because they presumed a structure that existed above, and not through, cultural actors on the ground.

The second major area of postmodern cultural anthropology addressed the ways in which anthropologists went about doing anthropology. Some traditionalists (though not necessarily uncritical of some of the concerns of postmodern anthropology) in the discipline continued to advocate for approaches to fieldwork that modeled strictly the exemplars of participant observation of Bronisław Malinowski. Some ethnographers of the apparent postmodern camp, including Renato Rosaldo, suggested that new insights be brought to bear on the methodologies of the discipline. In "Grief and a Headhunter's Rage" (from *Culture and Truth: The Remaking of Social Analysis*), Rosaldo presented a complex methodological interplay of the rage of the Ilongot he studied with his own rage and identity as he dealt with the tragic death of his wife, Michelle Zimbalist Rosaldo. Rosaldo, like many other postmodernists, offered the idea that emotion, subjectivity, and the important aspect of reflexivity could, and indeed should, be a part of new methods of fieldwork.

Another significant development in anthropological research methods is the new way in which some field-workers conceptualize their field studies and undertake them. George Marcus has passionately argued for new forms of what he calls research imaginaries, and one in particular—multisited ethnography (ethnography that involves more than one field site)—has influenced both cultural anthropology and the social sciences. Additionally, in multiple publications, Marcus, along with Paul Rabinow, has called for new models of research collaboration and for rethinking the traditional relationships between informant and field-worker. One of the most interesting examples of this latter development is Marcus's notion of ethnographic complicity, or the idea that

ethnographers and informants are wrapped up in mutual and conflicting moral and political worlds.

The third area focuses on the textual criticisms of ethnography. Since much of postmodernism developed in literary critique, postmodernists were drawn to the analysis and critique of ethnographies. On the one hand, the postmodern approaches of the late 1980s took issue with ethnography as a disciplinary form—a model that graduate students and future ethnographers were asked, at least by traditionalists, to follow almost religiously. In some part, this concern was influenced by the work of Clifford Geertz, who prior to the late 1980s established an important critical focus on interpretive anthropology, "thick description," and an emphasis on the anthropologist as a kind of author. The contexts established in *Writing Culture* most famously situated ethnography in a "crisis of representation." Exceptionally significant in the *Writing Culture* critiques were notions of ethnographic authority and power, the rhetoric of ethnographic texts, the role of the ethnographer, and numerous other issues that challenged the idea of ethnography as the hallmark of the discipline.

On the other hand, the postmodern ethnographic criticisms of the 1980s focused attention on the production of actual postmodern or experimental ethnographies. These are ethnographies that have presumably followed the epistemological, methodological, and representational critiques of postmodern anthropology and have developed new and postmodern approaches to textuality, including new approaches to reflexivity, bifocality, montage and juxtaposition, "messy texts," and other experimental approaches. Some of the earliest examples of such texts include Paul Rabinow's *Reflections on Fieldwork in Morocco* (1977) (notable for its critical insights on the relationship of the ethnographer and the informant), Jean-Paul Dumont's *The Headman and I: Ambiguity and Ambivalence in the Fieldworking Experience* (1978) (for its attention to how Dumont's informants viewed him in the field), Vincent Crapanzano's *Tuhami: Portrait of a Moroccan* (1980) (especially for its challenge to traditional notions of life history), Kevin Dwyer's *Moroccan Dialogues* (1982) (for its challenging of scientific realism and advocacy for dialogic approaches to ethnography), Anna Lowenhaupt Tsing's *In the Realm of the Diamond Queen* (1993) (critical for its emphasis on redefining the notion of the ethnographic imaginary and its use of multiple textual techniques), Kathleen Stewart's *A Space on the Side of the Road* (1996) and *Ordinary Affects* (2007) (both for their attention to the intricacies and contradictions of everyday life), Marc Augé's *In the Metro* (2002) (for its meandering focus on the city metro system), and George E. Marcus and Fernando Mascarenhas's *Ocasião: The Marquis and the Anthropologist: A Collaboration* (2005) (for its new approach to ethnographic collaboration).

One of the highest levels of experimentalism in ethnography is found in the work of the anthropologist Michael Taussig. Beginning with *Shamanism, Colonialism and the Wild Man: A Study in Terror and Healing* (1987), Taussig has traced an interesting and critical path for experimental ethnography. Some of his later work, including *The Magic of the State* (1997), has been criticized for its reliance on approaches that stray too close to fiction and that emphasize too heavily the presence of the ethnographer. While Taussig, and many of the other ethnographers listed, do point to a new realm of possibility and experimentalism within ethnography, these only partially enact what Stephen A. Tyler argued for postmodern ethnography in his "Post-Modern Ethnography: From Document of the Occult to Occult Document" (1987). While it would be difficult to construe Tyler's concepts in this particular piece as a guidebook for enacting postmodern ethnography, many of his concepts have not been fully explored in an experimental ethnographic sense—an effect that strikes the discipline, much like the entirety of postmodernism, in indirect, ironic, and sometimes unseen ways.

Criticisms of Postmodern Anthropology

The criticisms of postmodern anthropology have been widespread and varied in approach and tone. One, and perhaps the most common, focuses on the idea that postmodernism attacks the scientific and methodological bases of the discipline. Many empiricists and positivists claim that postmodernism has moved the discipline toward a nonscientific basis, perhaps more toward the humanities. One especially prevalent form of this critique has been the assertion that postmodern anthropology is primarily a textual movement, hence a moniker of the "literary turn" in anthropology that some critics have offered.

An additional form of this critique has been the argument that postmodernism steered professional anthropology away from concerns with fieldwork and into concerns with ethnography as a textual object. Postmodernists such as Stephen P. Sangren and George Marcus have responded that critics have too rigidly construed postmodernism as purely textual critique and ignored the degree to which it has opened anthropology to more critical dialogue and debate about its core principles.

Additional criticisms have highlighted the sometimes challenging level of language of some postmodernist texts (e.g., the work of Tyler). They have charged that postmodern anthropology is solipsistic, egotistical, and noncommunal, and that it has fractured the discipline and destabilized the political bases of anthropology (a common critique offered by feminist anthropologists). Furthermore, they have charged that postmodern anthropology, because it takes a critical and revolutionary position, develops its own sort of authority, a sense of privilege within the discipline. Some, including Marvin Harris, have gone so far as to associate some of the approaches of postmodernists—including those of Tyler and a number of feminist ethnographers—with fascist impulses. In his *Theories of Culture in Postmodern Times*, Harris suggests that the purported extreme relativism of postmodern ethnography parallels the political relativism espoused by the fascist Benito Mussolini. In Harris's mind, the ideas of postmodern ethnography are the latest in a line that runs from Nietzsche to Mussolini to the postmodernists. Many of these criticisms appear to be personal in nature and do not seem to advance the discipline, but taken as a whole, they represent a possible space for future dialogue within anthropology.

Feminist Anthropology

Like postprocessualism and postmodern anthropology, feminist anthropology has offered especially insightful and often intense criticisms of mainstream anthropology. Feminist anthropology shares with postmodernism insights about disciplinary power, the political dynamics of fieldwork, and the focus on new forms of reflexivity and ethnographic voice. Feminist practice within anthropology may be traced to the important legacies of Margaret Mead and her contributions to fieldwork practice, ethnography, and the study of gender in society. Years later, Rayna (Reiter) Rapp's *Toward an Anthropology of Women* illustrated the many ways in which women had been excluded from ethnographic study and how male bias had affected anthropology. In the late 1980s, Henrietta Moore published *Feminism and Anthropology* and further elaborated the critiques of Rapp. Moore argued that even work done by female anthropologists reproduced a patriarchal bias. In terms of disciplinary standing within anthropology, like postmodernist anthropology, feminist anthropology was often relegated to a minor status within the academy. Critics of this approach have argued in a vein similar to those who have expressed concerns about the nature of postmodernist anthropology. For some, the feminist approach is antiscientific and too controversial for its attack on the many biases of mainstream anthropology. In the 1980s, other feminist anthropologists produced work that, in many ways, paralleled the disciplinary critiques of postmodernist anthropology. Feminist anthropology introduced important insights from academic feminism, such as standpoint theory (or the effect of an individual's perception on the construction of knowledge), into many circles within professional anthropology. Interestingly, it is the connection with the postmodernist anthropological critiques of the late 1980s that provided both an impetus and a challenge to feminist anthropology.

Many have pointed out that before the critiques of the late 1980s, some feminist ethnographers had drawn attention to the dynamics of power and knowledge within field contexts and others focused on addressing these dynamics, in their own right, by developing forms of reflexivity in their ethnography. This issue, in combination with a comment made by Clifford in the introduction to *Writing Culture*, provided a springboard for much of the dialogue that surrounded feminist anthropology. Clifford claimed that there was a viable feminist ethnographic critique; this was seen as an affront by some critics, and others, perhaps unfairly, viewed this as a delegitimation of feminist ethnography. While Clifford's comments may have been taken out of context, in their wider consideration, they do suggest political contexts in which feminist ethnography has been viewed as secondary to other camps within the discipline. In addition to this political issue, some feminist anthropologists have expressed concern that the postmodernist critiques of anthropology allow for the continued subordination of feminist

ethnographers. These feminist critics argue that postmodernist anthropology maintains a masculinist subjectivity and thus does not represent a true decolonization of contemporary anthropology.

Margery Wolf has argued that the crisis of representation addressed in postmodern anthropological critiques has an additional aspect—the responsibility of the ethnographer to the informant and the audience. Judith Stacey has argued that this political responsibility, ironically, challenges the ability to have a truly authentic feminist ethnography. Other feminist ethnographers have suggested the combining of postmodern or experimental tendencies within ethnography with forms of political praxis and activism, as in new ethnographies of the national state, globalization, and other phenomena. Perhaps one of the most interesting results of the energetic debates among postmodernists, feminists, and traditionalists within the discipline is an exciting future syncretism of ethnographic form and practice.

Legacy

While it is impossible to state all of the specific ways in which postmodernism has influenced anthropology, it is clear that it can be said that postmodernism has challenged the epistemological, methodological, and representational (textual) foundations of the discipline. In the 2010s, there are already signs of rapid shifts that have occurred as a result of these critiques. New models of culture, society, and the individual have taken root (see *Global Assemblages: Technology, Politics, and Ethics as Anthropological Problems*, edited by Aihwa Ong and Stephen J. Collier; *Lines: A Brief History* by Tim Ingold; *Empire of the Senses: The Sensual Culture Reader* by David Howes; and *Partial Connections* by Marilyn Strathern), new and innovative fieldwork methods have been developed (multisited ethnography, notions of ethnographic complicity, and considerations of global/local contexts), innovative research designs have been created (Anthropology of the Contemporary Research Collaboratory at the University of California, Berkeley; Center for Ethnography at the University of California, Irvine), and ethnographic texts have become more experimental in nature—though perhaps, disappointingly, not fully so. While the ultimate power of postmodern anthropological critique may remain phantomlike—perhaps due to the continued marginalization of this power by mainstream forces in the discipline—the legacy of this important critique will continue to inspire.

POSTSTRUCTURALISM

Although the term *poststructuralism* is sometimes used loosely to refer to general theoretical trends in anthropology since the 1970s, it was first coined to

describe the work of a number of French scholars—principally, Roland Barthes, Jacques Lacan, Michel Foucault, and Jacques Derrida—who were stimulated by or in dialogue with Claude Lévi-Strauss. Except for Lévi-Strauss, these scholars were not anthropologists; rather, their expertise ranged primarily across literary theory, psychoanalysis, history, and philosophy.

Structuralism and the Roots of Cultural Critique

The theoretical system known as structuralism, which Lévi-Strauss inaugurated in anthropology in the 1940s, had become by the 1950s and 1960s a broad intellectual movement in France. It was also becoming increasingly influential elsewhere in Europe and in North America. In reacting to this movement, it was inevitable that Barthes, Lacan, Foucault, and Derrida would have some impact on anthropology. Foucault's work eventually became especially influential in the discipline, and Foucauldian theory is now sometimes taken by anthropologists to exemplify poststructuralism as a whole. Although there are other significant strands to poststructuralism that developed through Barthes, Lacan, and Derrida (and some others), these have had less impact on anthropology.

Initially, Barthes, Lacan, Foucault, and Derrida were themselves regarded as structuralists because they shared with Lévi-Strauss an interest in structural linguistics. Structuralism had its roots in the linguistic theories of Ferdinand de Saussure, with their teachings about the arbitrariness of the linguistic sign and the idea that words do not have meanings in and of themselves but only by virtue of their relational positions within systemic codes or "structures." Lévi-Strauss was also profoundly influenced by his encounter with American cultural anthropology, with its emphasis on the fundamental relationship between language, worldview, and cultural configuration. In 1960, he declared social anthropology to be so akin to linguistics that it should be defined as a branch of semiology—the study of signs. In so doing, he recast Émile Durkheim and Marcel Mauss's earlier emphasis on collective representations and located anthropological endeavor, even in areas such as kinship, economics, and technology, as the study of cultural models or systems of meaning. Anthropology's object was thus defined as "the symbolic function," which Lévi-Strauss located in the ordering properties of the unconscious mind.

By 1960, French intellectual life had been dominated for some time by phenomenology and existentialism, philosophies that emphasized the fundamentally subjective and experiential dimensions of authentic knowledge of the world. Lévi-Strauss's structuralism provided a strong objectivist and rationalist countercurrent to this, suggesting that truth inhered in the general properties of symbolic systems, not in the intentional lives of individuals, and that this truth could only be recovered by investigative methods, not by intuition. However, when Lévi-Strauss began to popularize this view, particularly after the publication of his *Tristes Tropiques* in 1955, Barthes and Lacan were inspired to put forward their own, rather different ideas about the relationship between structural linguistics and culture. A little later, they were joined by Foucault and Derrida. Broadly speaking, this is the shift from structuralism to poststructuralism. While this terminology signals some large departures that Barthes, Lacan, Foucault, and Derrida made from Lévi-Strauss's original ideas, affinities remained in poststructuralism's abiding concerns with signification and the nature of human subjectivity.

Jacques Lacan

Lacan independently established an interest in Durkheim in the 1930s, but Lévi-Strauss later introduced him to Saussure and structural linguistics. This prompted Lacan to move toward what he called his "return to Freud," which in effect meant a linguistically informed reinterpretation of the psychoanalyst's idea of the unconscious. While Lévi-Strauss took structural linguistics into the study of culture as forms of objectified thought (kinship, totemism, and myth), Lacan pursued its links to people's inner life, eventually declaring his view that the unconscious was "structured like a language." More than that, he suggested that systems of signification *create* the unconscious as "the Other," in the sense that becoming a human subject requires the submission of one's egoistic desires to orders of rules and regulations (repression). At the same time, however, the unconscious becomes the repository of all manner of creative connection between signifiers, which Lacan, borrowing directly from Lévi-Strauss, called "the Symbolic order." Where Freud had found

the unconscious to be indeterminately articulated by processes of condensation and displacement, Lacan suggested that these processes conformed to the metaphoric and metonymic characteristics of language as processes serving to express the subject's unconscious desire (sublimation). Implicit in this view was the idea that the unconscious must always be a *cultural* unconscious, even though its structural relationship to the ego was in some sense necessary and universal.

While Lévi-Strauss modeled the symbolic function as a taken-for-granted aspect of the human condition, Lacan was more concerned with how the symbolic order takes root in persons and is maintained as intersubjectivity. As a psychoanalyst, he favored an explanation privileging the Oedipal situation, suggesting that the symbolic was tied to "the law of the father" and in tension with the order of "the Imaginary," which involved a mirror-like identification with objects, archetypally the mother. Lacan made some remarks about the specificity of modern Oedipal dynamics and suggested that these were not exactly replicated in other cultures, but he did not fully engage with anthropological debates about the universality of the Oedipus complex. Neither did he systematically link his ideas about language and the unconscious to the contemporaneously emerging field of ethnopsychoanalysis. While a few anthropologists have operationalized aspects of Lacanian theory in ethnographic situations since the 1970s, Lacanian anthropology has not formed a recognizable disciplinary field in its own right, tending instead to function as an adjunct to other perspectives.

Louis Althusser and Roland Barthes

Louis Althusser took an interest in Lacan's theories in an effort to better conceptualize the Marxist notion of ideology, suggesting that Lacanian theory well described the way in which subjects were "interpellated" by systems of signification. However, it was Barthes who most systematically used structuralist ideas to support Marxist analysis and critique. Barthes was from the outset a violent critic of bourgeois culture in France, particularly as it was expressed through conventional literary theory. However, his most virulent attack on bourgeois values was mounted in his 1957 book *Mythologies*, where he sought to demystify a motley collection of signs operating in French culture—everything from striptease to laundry detergent and from professional wrestling to the latest Citroën car. His aim was to show how such cultural phenomena carried meanings that stretched beyond themselves along connotative chains of signification, so that wine and milk, for example, did not simply announce themselves to consciousness but, through certain equivalences and contrasts, obliquely spoke to the French national character as energetic and virile. For Barthes, this symbolism was a comfortable bourgeois artifice, alienating people from the ugly truths inherent in the circumstances of capitalist production and commodification—of wine and everything else.

In Barthes's hands, structuralism became a way of revealing truth and speaking to its power, primarily by way of taunt rather than as a call to arms. His moralizing style set him apart from Lévi-Strauss and Lacan, and most of his projects, which lay principally in the field of literature, were highly marginal to anthropology, if not to the burgeoning field of cultural studies. In time, Barthes became dissatisfied with the kind of technique he had deployed in *Mythologies*, realizing that it depended on a point of reference that placed him, as author and knowing subject, outside the system of signification and in direct touch with truth and reality. In structuralist terms, this was an impossible place to be, hence the maxim eventually coined by Derrida: "There is nothing outside the text." Barthes's response was to declare "the death of the author," indicating that there could be no final or fixed account of cultural products, only a multiplicity of interpretations that should be actively fostered by an open, indeterminate process of writing, rather than closed down in the name of ultimate truth. This view was eventually echoed in Clifford Geertz's account of thick description (although he appeared to owe no particular debt to Barthes) and played a significant part in the turn toward experimental writing in anthropology during the 1970s and 1980s. Barthes also studied Japanese culture, publishing his account in 1970 as *The Empire of Signs*. He argued that the manner in which Japanese people trucked in signs illustrated a culture without any Western-like notion of transcendental subjectivity, a position that recapitulated Geertz's modeling of Balinese personhood in his famous essay "Person, Time and Conduct in Bali." This correspondence was not entirely fortuitous, since it indicates how the trend toward

poststructuralism was part of a larger movement of cultural critique and the undoing of Eurocentricity.

Jacques Derrida

Jacques Derrida is generally credited with the definitive poststructuralist critique of Western philosophical assumptions, which he initiated by accusing structuralists of continuing to privilege a "metaphysics of presence" and the idea of a coherent subject, in spite of the structuralist mantra that all identity is necessarily relational and largely beyond itself. He is associated with the term *deconstruction*, which is sometimes confused with cultural critique and demystification but which in fact refers to a method of exposing contradictions in texts. Contradictions are not treated as error but as intrinsic, as well as self-referential, so that deconstruction is always ranged against consistency, including one's own. Derrida applied this method not only to the writings of Saussure, Lévi-Strauss, Lacan, Foucault, and a number of philosophers but also to a number of social and politico-legal issues, such as globalization, sovereignty, violence, and the relationship between law and justice. His broad position was that, in all matters, one necessarily works toward some horizon—a place that is simultaneously a limit and an opening, and therefore a paradoxical wedding of presence and absence. Deconstruction is therefore at once the construction and the destruction of identity, a "decentering" of both subjectivity and Enlightenment reason.

Like Barthes, Derrida's significance for anthropology lies principally in the field of cultural critique. In destabilizing the West's metaphysics of presence, Derrida was also exposing its ethnocentrism—even in Lévi-Straussian anthropology. While Derrida is not frequently found in anthropological writing, his indirect influence has been immense because of the way in which postcolonial theorists such as Homi Bhaba, Gayatri Chakravorty Spivak, and Robert Young took up his work after the 1970s. For postcolonial theory, Derrida offered a way of conceiving global history and the relationship between "the West and the Rest" that was responsive to subalterns, defined as those who had been excluded from hegemonic colonial discourses.

Postcolonialism and Michel Foucault

As an effect of decolonization during the middle of the 20th century, postcolonialism not only refracted globalized identity politics and new nationalisms but also caused a crisis of consciousness in the West, whose relationship to its "Other" was being confounded. Unsurprisingly, anthropology, as the study of this Other, suffered a similar fate, leading to a crisis of representation. The publication of Edward Said's *Orientalism* in 1978 was a key marker of this crisis and was quickly taken up by anthropologists. The 1983 publication of Johannes Fabian's *Time and the Other: How Anthropology Makes its Object* was more anthropologically symptomatic, but both books asked searching questions about the way Western intellectuals construct those regarded as exotic. However, Derrida was almost entirely absent from these texts; rather, their primary poststructuralist inspiration was Foucault.

Foucault distanced himself from structuralism and rarely engaged its terminology, but his publications did go directly to relevant matters concerning language and signification. Beginning in the 1960s, and informed by work in the philosophy of science, he embarked on a series of projects in the history of ideas, along the way introducing and refining a battery of concepts concerning the relationship between knowledge and power. He suggested that there were specific epochs in history characterized by distinctive epistemic orders that generated discourses of various kinds—for example, about sexuality, mental health, criminality, art, or science. His interest was in epistemic change, but as a lapsed Marxist, he did not treat discourses as superstructural. Rather, discourse was seen to reflect desire and power, manifesting itself as the will to speak the truth—hence the intricate coupling of knowledge and power.

Power was not simply located hierarchically but was "everywhere," wherever discourse was encountered. Discourses created subjects as "positions." Rules of inclusion and exclusion defined what was proper and improper, so that some discourses and positions were central and authoritative, while others were marginal and resistant to domination. While Foucault explored the former, he was most interested in the ways in which deviant discourses were expressed and repressed, particularly in modern society, which he characterized as "disciplinary," "carceral," "panoptic," and "governmental." He tended to imply that modern techniques of discursive control were pathological in their obsession with uniformity and their repression of otherness. Consequently, his preference was for exploring the resistant and plural voices of the marginal—criminals, lunatics, and perverts. In valorizing these voices, his

work was not simply poststructural but antistructural, and therefore easily aligned with work that was not simply postcolonial but anticolonial.

Said's Foucauldian thesis in *Orientalism* was that the West had discursively controlled and thereby subordinated the Orient. Fabian's *Time and the Other* ghosted Said's book in suggesting that anthropology had been guilty of similar intellectual imperialism, a charge specifically leveled at Lévi-Strauss and structuralism. However, Foucault has also had a more positive impact on anthropology, inspiring not only a valorization of the Other's voice through dialogical methods but also a systematic ethnographic interrogation of Western knowledge, including that of science. Paul Rabinow's work since the 1970s typifies this "anthropology of the contemporary," although Foucault's influence is pervasive, with the idea of discourse in large measure serving to displace or redefine the idea of culture. In addition, his take on power/knowledge has contributed greatly to the politicization of the discipline, filling the void created by the near abandonment of structural Marxism after the 1970s, although there remains much argument about Foucault's emancipatory potential.

Poststructuralism, Anthropology, and Decentered Subjectivity

Poststructuralism contributes significantly to postmodern thought but is not coextensive with postmodernism. It has never been a unified theoretical approach, and it cannot be identified with a single thinker. However, structuralist and poststructuralist studies have been united in their concern with culture as signification, now most commonly named as "discourse." A further common thread lies in an anti-Cartesian attitude, where singular identity is subordinated to plural relationships—an idea that is now commonplace in anthropology, although it has not always been directly derived from structuralism. The passage from structuralism to poststructuralism in anthropology, from Lévi-Strauss, Lacan, and Barthes to Derrida and Foucault, can be broadly defined in those terms—as a therapeutic working through of the idea of decentered subjectivity at a time when the discipline was losing its "primitive" object and rediscovering itself in a much fuller, if less disciplined, relationship with its Other.

Practice Theory

Pierre Bourdieu's intellectual project is distinguished by methodological and conceptual schema devoted to the synthesis of oppositions that are apparent in Western thought and the social sciences. Such oppositions include the binaries of body and mind, structure and agency, subjectivism and objectivism, theory and practice, the material and the symbolic, as well as interpretation and explanation. Because Bourdieu viewed such antinomies as artificial, much effort in his scientific program was mobilized to reconcile seemingly antithetical theoretical positions. Such attempts at synthesis were undertaken by following the methodology of reflexive scholasticism, which Bourdieu advocated. So in an extensive body of work, he continued not only to refine, rework, and rethink but also to rarely fix his conceptual

schemata. That Bourdieu was seldom categorical in his exposition of concepts and analytical devices makes attempts to specify and also apply his constructs challenging. The challenge is compounded by the use of an abstract stylistic idiom or, as detractors would argue, a convoluted writing technique to expound on some of his key analytic tools. Attempts to unravel the enigma of his constructs and theory therefore must reckon with such density and also with the fact that the development of his notions occurs through writings that are not only theoretical treatises but also empirical dissertations. A further layer of difficulty is presented by the interdependence of the constructs that inform his conceptual repertoire, as the disambiguation of one item in Bourdieu's lexicon requires the concurrent decoding of others. Such is the case in his theory of practice.

Bourdieu's theory of practice was an attempt to overcome the deeply entrenched dichotomy between subjectivism and objectivism. This attempt is elaborated through many of his writings, and the first substantial formulation of the theory was initiated in *Esquisse d'une théorie de la pratique*, which was translated and revised as *Outline of a Theory of Practice*. In this volume, Bourdieu's conceptualization of practice unfolded within a detailed ethnographic account of Kabylian matrimonial strategies, rituals, and myths. He amplified his framework as well as his ethnography and further developed his notions of practice in *Le sens pratique*, or the *Logic of Practice*. In the *Logic of Practice*, Bourdieu also articulated his concerns about reflexivity in scholarly practice by emphasizing that the construction of knowledge, including anthropological knowledge, and observation is situated in and informed by context. In *La Distinction: Critique sociale du jugement*, translated as *Distinction: A Social Critique of the Judgement of Taste*, practice is discussed as inextricably linked to the concepts of habitus as well as of capital and field, or what are considered the principal thinking tools of Bourdieusian approach.

Subjectivism and Objectivism: A Binary Opposition

According to Loïc Wacquant, Bourdieu's signature intellectual style is monistic, or antidualistic. In the *Logic of Practice*, Bourdieu argued that the division between subjectivism and objectivism was one of the most fundamental and ruinous in social science. In advancing his theory of practice, then, he sought to overcome the incompatibility between the two. According to Bourdieu, subjectivism is a stance in the social sciences that takes representations as a point of departure to assert that reality is the accumulation of acts of interpretation on which people construct lines of meaningful interaction. Objectivism, on the other hand, implies that the social world is constituted by sets of rules, relations, and forces that impose themselves on individuals to determine conduct and representations. Bourdieu's project was to produce an analytical apparatus that enabled the transcendence of such binary oppositions.

Bourdieu insisted that the work of intellectuals and the ideas to which they subscribe should be read and understood as conditioned by the context that produced it. In submitting his theory of practice to such a contextualization, two key facets serve to illuminate the significance of his theory of practice, particularly as a transcendental instrument. First is the temporal and intellectual context of the formation of Bourdieu as a scholar. Second is the empirical context of his fieldwork experiences. As a scholar, Bourdieu came of age during a period of time in the 1940s and 1950s when phenomenology and structuralism prevailed as the dominant modes of thought in France. These modes of thought were simultaneously incorporated into and repudiated in his work. To Bourdieu, the dichotomy between subjectivism and objectivism reflected the epistemological positions of phenomenology and structuralism. Largely the domain of German philosophers, such as Edmund Husserl and Martin Heidegger, phenomenological premises also had their French interlocutors. One of the most notable was Maurice Merleau-Ponty, with whom Bourdieu studied. Phenomenological premises also were present in the work of the postwar existentialists. Subjectivism then was concerned with ontological questions of *being*, asserting the primacy of idealism as well as issues of human will, individual choice, and personal freedom. The objectivist tradition was embodied in the work of Claude Lévi-Strauss and an anthropological program that sought to explain human behavior as a reflection of rules. Structuralism's project was to render visible the invisible social structures, regularities, and rules that governed human action in different societies and cultures. Bourdieu acknowledged that each of these modes of knowledge represented a distinct view of human action. In phenomenology

or subjectivism, human action is seen as a function of individual choice and decision making; while in structuralism, human actions are seen as a function of rules of behavior. Subjectivism became a presupposition of ethnomethodological, constructivist, culturalist, and interpretivist approaches to analyzing the social world. The constructivist, culturalist, and idealist approaches investigate the commonsense perceptions and actions of the individual. The structuralist-analytic approach pursues the invisible relational patterns operating behind the backs of agents. To Bourdieu, neither analytic optic was tenable as a way of understanding the social world in its own right. The tenuous status of these stances as independent theoretical positions was underscored by observations of human action made during his fieldwork.

In fieldwork among the Kabylia of Algeria and also the rural Béarn, Bourdieu observed that human action did indeed involve choices and decisions. But he also observed that choices and decisions were not made according to an individual's free will. In both contexts, for example, he observed that marriage choices were not simply a function of choosing and not the mere application of social rules. What Bourdieu saw was that individual action emerged from an unconscious calculation and a strategic positioning in a specific social space to accomplish a social end.

The Notion of Habitus

The puzzle for Bourdieu was to account for how behavior is regulated without being a function of following rules. In working through this problem and based on field-derived observations, he argued that the social world could not be understood by reducing the field of the observer's vision to the voluntarism that was a descendent of phenomenology or to the determinism that was a descendent of structuralism. His view was that there was in fact an "ontological complicity" between objectivist and subjectivist modes of knowledge and also a dialectical relationship between these seemingly antagonistic theoretical stances. Bourdieu's theory of practice therefore explores this ontological complicity by elaborating on the dialectic between subjectivism and objectivism. The elaboration of this dialectic is particularly enabled by the notion of *habitus*, and his theory of practice is further realized through the interrelated constructs of *habitus*, *capital*, and *field*. In his 1984 work *Distinction: A Social Critique of the Judgement of Taste*, Bourdieu formalizes the interrelationship as

$$[(\text{Habitus})(\text{Capital})] + \text{Field} = \text{Practice}.$$

The general thrust of his theory of practices is encapsulated in this formula. As the formula suggests, practice results from a relationship between habitus and capital within the context of a social arena or field. To acquire a sense of how Bourdieu theorized practice, then, requires a decoding of the terms in the formula.

In moving from the right side of the equation toward the left, the notion of practice in Bourdieu's work means quite simply social action. Social action or behavior can consist of the entire array of human activity, including marriage rites, market transactions, war, forms of bodily behavior, mental activities, the exercise of tastes, judgments, and preferences, ad infinitum. Practice, however simple in meaning, nonetheless, is the result of a complex dialectic between social externalities and individual internalities. While field is external and informs practices from without, habitus is internal and structures practices from within.

A *field*, according to Bourdieu, is a social space in which forces impose regularities and regulations that constrain choices from without. Much of Bourdieu's explication of field is undertaken by positing analogies to sports fields, occupational fields, and artistic fields, each of which can be distinguished by certain forms of practice. The notion of field is also marshaled to explain distinctive social practices followed by those occupying different positions in a field, among which are the differentiations inflected by class. Field, according to Bourdieu, is also a social space of struggle and contestation, in which the basis of domination and hierarchy is subjected to disputes that are translated into practices. At stake in this field is the accumulation of capital, which both reflects and results from class positionings.

Bourdieu isolated four forms of capital. *Economic capital* refers to money and assets. *Cultural capital* refers to forms of knowledge, tastes, aesthetic and cultural preferences, language narrative, and voice. *Social capital* refers to networks and affiliations, including family and religious ties. Finally, *symbolic capital* refers to the capacity of different capitals to be exchanged and converted between fields. Those

who occupy positions of domination will struggle to conserve their position by pursuing practices that will preserve the existing distributions of all of these forms of capital. While those who are assigned subordinate positions will challenge the existing order and pursue actions that will challenge such distributions. To understand practices, it is necessary to reckon with the regularities of social fields and how they are related to the practical logic of social agents. This practical logic is a feel for the regularities of the field. It is also critical to reckon with the relationship between the evolving fields within which social agents are situated and also the evolving habituses, which those social agents bring to their social fields of practice. For Bourdieu, then, practice is generated at the juncture of field and habitus.

Habitus is a concept that is central to Bourdieu's theory of practice, yet it is the most enigmatic and is defined in many and varied ways throughout his work. So Bourdieu, in characteristically abstract fashion, writes of habitus as being the product of the structure, producer of practice, and reproducer of structure. It is also the unchosen principle of all choices and the practice unifying a practice-generating principle. In a 2008 essay, Karl Maton distills from this writing that habitus essentially focuses on our ways of acting, feeling, thinking, and being, as well as how we bring our past into the present to make choices as an ongoing interactive and evolving process. The choices before any individual are constrained by the current context or field and by the range of choices that are visible to the agent. This vision, in turn, is shaped by past experiences, which are embodied in the agent, and habitus thus informs practices from within.

The Role of Dispositions

Practices are thus not simply the result of one's habitus but rather of unconscious relations between habitus and one's current circumstances. Habitus thus helps explain the sociological conundrum presented by the consonance between sociological regularities and individual experience. For example, certain working-class children tend to get working-class jobs and be drawn to popular forms of art and entertainment, considered to be lowbrow. By the same token, many upper-class individuals enjoy high art and literary forms, and so on. Yet there are no rules that prescribe these tendencies or predilections. At the level of individual experience, people feel that they are free agents who choose such forms of entertainment or class-based occupations. Sociologically, such practices are expressions of regularities. This structure then is structured and comprises a system of *dispositions*, which materializes in certain perceptions as well as practices. Dispositions, according to Bourdieu, express first the result of an organizing action, with a meaning close to that of structure. But they also designate a way of being, a habitual state, and, in particular, a predisposition, tendency, propensity, or inclination. The idea of disposition then is pivotal in thinking through the implications of habitus in Bourdieu's theory of practice.

Structure and Agency

Bourdieu's construct of habitus suggests how the social becomes internalized in the individual. It is thus the link between the social and the individual, the outer and the inner, and, most important, the objective and the subjective. As a foundational concept in Bourdieusian thought, habitus offers a way of confronting not only the dualism of objectivism and subjectivism but also the interlinked dichotomy of structure and agency. Structure refers to the social structures that sociologists and anthropologists expose in their objectivist analytics. Agency refers to the mental structures that guide individuals in their interactions with and against objective structures. As habitus conceptually collapses the subjective and the objective, it enables an understanding of how agents are able to incorporate a practical sense of what can or cannot be achieved—the objective possibilities—based on their intuitions gained through past collective experiences. The habitus then, as Bourdieu states, produces practices that tend to reproduce the regularities immanent in the objective conditions of production of the generative principle. So, as Jeremy Lane suggests, habitus is generally understood to be a structure of dispositions that reflect a field of objective possibilities open to agents at a particular historical moment. In other words, it is a system of internalized dispositions that mediate between social structures and practical activity and refers to the implicit cultural assumptions transmitted by institutions, practices, and social relations, which then generate action according to certain dispositions. The notion of habitus is central to the theory of practice for it provides a key to understanding how

it becomes possible to move beyond the entrenched antinomies and dualisms in the ways of thinking about the social world.

Bourdieu's Dialectical Epistemology: A Call for Reflexivity

The distinctiveness of Bourdieu's thinking lies in its relational and dialectical approach. In his theory of practice, the subjectivism and objectivism dyad is reconciled through such a dialectical epistemology. As Bourdieu states in *Outline of a Theory of Practice*, an adequate science of practices aims to make possible a science of the dialectical relations between the objective structures to which the objectivist mode of knowledge gives access and the structured dispositions within which those structures are actualized and that tend to reproduce them. Bourdieu, therefore, proposes a conceptual framework that embeds the dialectical nature of the relationship between structure and agency as well as subjectivism and objectivism. In this respect, his work occupies the interstices between the determinism of structuralism and the voluntarism of intentionality. Bourdieu's work is also distinctive in that it moves us beyond the dualisms, conceiving a new space in which structure and agency are interpenetrating, reciprocally constituting, and interdependent. The internalities of habitus and externalities of field are also reciprocally formed and mutually constituted in a true dialectic.

To Bourdieu, the theory of practice is also a tool deployed to understand the activities of both the observer and the observed. In *Outline of a Theory of Practice* and *Logic of Practice*, he was concerned to constitute the actions of social scientists as practical, engaged social activity. This again emerged from dissatisfaction with structuralism and how, as a body of thought, its stance toward people was to constitute them as objects of interpretation for academic philosophers. He was concerned with the development of a sociology that would situate analyses as practices and as such would relativize objectivism itself. Repudiating this view, Bourdieu's project was to develop a form of social science practice that would relativize objectivism by placing it within the social world and not above it. He favoured a move toward seeking to understand the agency of those whom we study as theory-generating agents rather than as the fodder on which scholars build their theories. And through the recovery of the agency of the observed, theory would itself be a practical and engaged social activity. Finally, in reflecting on the practice of the intellectual in the academic field, he suggested that generative principles in theoretical knowledge must also be analyzed. Intellectuals must submit their formulations to an analysis of the intellectual's relation to the social world and the objective social conditions on which scholarly inquiry is founded. In this call for reflexivity, Bourdieu inveighs against scholasticism as an idealist project. In this way, the theory of practice recovers the work of intellectuals as a form of engagement in and with the social world.

Prague School of Linguistics

The beginnings of the Prague school of linguistics date back to the foundation of the Prague Linguistic Circle in 1926. The school's ideas have been continuously developed until today, even during the German occupation and the 40 postwar years when the Circle was disbanded. From the viewpoint of its official existence and the three series of its *Travaux*, the Circle's history can be divided into three periods closely connected with, and reflecting, the situation in Europe and in Czechoslovakia during the past century. The first period, often referred to as the classical period, embraces the decades from the Circle's foundation until the 1950s. Then under the communist regime framing the second period, the Circle was replaced by a newly established society, Jazykovêdné sdružení (Linguistic Association) and Kruh moderních filologů (The Circle of Modern Philologists/Modern Language Association), a philological society of long standing. This period lasted until the overthrow of the communist regime in 1989. In the democratic atmosphere of the recent decades, the Circle resumed its activities as early as 1990 by holding fortnightly lectures followed by discussions, which were open not only to members but also to the academic public at large.

The postwar and the postcommunist periods are treated together since many of the scholars who worked in the former are still active and have students and followers.

The Classical Period

The Prague Linguistic Circle was founded by Vilém Mathesius, the founder of English studies at Charles University in Prague, then the capital of Czechoslovakia. The first meeting of the Circle, in October 1926, was attended by five members, Vilém Mathesius, Bohuslav Havránek, Roman Jakobson, Jan Rypka, and Bohumil Trnka, and an invited lecturer, Henrik Becker from Leipzig. The Circle quickly grew into an international association, counting among its members not only prominent linguists, such as Vilém Mathesius, Bohuslav Havránek, Roman Jakobson, Sergej Iosifovič Karcevskij, Vladimír Skalička, Lucien Tesnière, Bohumil Trnka, Pavel Trost, Nikolaj Sergejevič Trubetzkoy, Josef Vachek, and others, but also foremost literary scholars, such as Jan Mukařovský, René Wellek, and others. The term *L'École de Prague* dates back to 1932, when it was first used in the documents of the Amsterdam Congress of Phonetic Sciences.

The Basic Concepts

The theoretical framework of the Prague school is functional structuralism, which reflects its principal concerns: the structure of the language system, the functionality of language elements, and the social function of language, with an emphasis on the synchronic approach, especially in the early period.

The language system is understood as a whole composed of several levels, each of these mapped to a basic unit: phonological (phoneme), morphological (morpheme and word), syntactical (the sentence), and discourse (the utterance). The function of lower units is to realize units of the higher level, for example, phonemes realize morphemes, morphemes realize words, and so on.

The functional relation of these elements is oriented to their task or role played in a structure, as well as in the flow of discourse (communicative function). The task-oriented character of language gave rise to a teleological view of its structure and development, the means-end model.

The social function of language was elaborated in connection with the standard language and its differentiation and cultivation (a separate sphere of interest in the classical period, see below).

The third basic concept, besides structure and function, was the sign. Karcevskij described it in terms of asymmetrical dualism, namely, the tendency of the sign to have other functions besides that connected with a particular context; similarly, the content can be expressed by other means than by the primary sign alone. It is this quality of the sign that makes language development possible.

The ideas of Prague functional structuralism were anticipated before the appearance of Ferdinand de Saussure's 1916 *Cours de linguistique générale* in Mathesius's lecture "O potenciálnosti jev jazykových" (On the Potentiality of the Phenomena of Language), delivered in 1911. With its printed form also in Czech, it remained practically unknown until the 1960s, when it appeared in an English translation by Vachek in his *Prague School Reader in Linguistics* (1964).

In the early period, the primary spheres of interest were phonology, developed especially in the works of Trubetzkoy, Jakobson, Trnka, and Vachek, and morphology, a special concern of Jakobson, who elaborated the structural morphology of the Russian verbal system and Russian declension. The synchronic analysis of phonology led to its emancipation from phonetics. The phoneme was defined as a bundle of distinctive features that entered into sets of oppositions. For example, the phonemes /p/ and /s/ are distinguished by two oppositions, the place and manner of articulation. The best known set of distinctive oppositions was designed by Trubetzkoy in his *Grundzüge der Phonologie* (1939). An opposition is neutralized where it fails to assert itself; for example, in German and in Slavic languages, the opposition of voice in pairs of consonants like p/b, t/d, and k/g is neutralized in the word-final position: the words *Rad* ("bicycle") and *Rat* ("advice") have the same form [ra:t]. The approach to diachrony is shown in Jakobson's treatment of the phonological development of Russian, where developmental changes are described as having a therapeutic character in that they often restore the balance of the system. As a change may give rise to another weak point in the system, the system is in a constant process of development.

A third sphere of interest in the classical period was the theory of the standard language and language culture, developed especially by Havránek and Mathesius. In contrast to the previous views of correctness based on historical criteria, the functional theory of the standard language, of correctness and language culture, is determined by functional adequacy. The standard language is differentiated according to its various functions: communicative, technically practical, technically theoretical, and esthetic. Across this classification runs the differentiation according to the oral and written forms. The development of the standard language is determined, among other factors, by the tendency to intellectualization and by the cultural and civilizational role of the standard language in stimulating the enlargement and intellectualization of its vocabulary. Such intellectualization culminates in scientific-theoretical speech/writing. On the other hand, the function of the standard language as a kind of common language operates in the opposite direction, that is, it bridges the gaps between the various kinds of a particular language. Language devices differ in their degree of automatization or foregrounding (defamiliarization). Automatization refers to expression in the conventional linguistic form that does not draw any attention to itself. In contrast, foregrounding is the use of linguistic devices that are perceived as uncommon. The maximum foregrounding, used for its own sake, is found in poetic language.

In the sphere of grammar, a model presented in the early Prague school was the functional grammar of Mathesius. An English translation of Mathesius's key work, *A Functional Analysis of Present-Day English on a General Linguistic Basis*, appeared in 1975, 30 years after his death. The grammar is based on two functional acts: (1) the naming act and (2) the bringing of the naming units into mutual relations in the act of sentence formation (functional syntax). The formal aspect of both acts is treated in morphology. While formal analysis of the sentence singles out the subject and the predicate, functional analysis determines its theme and rheme, namely, what is spoken about and what is said about it, respectively. This functional division of the sentence gave rise to the theory of functional sentence perspective, a theory of information structure.

In the sphere of typology, language types were approached from the functional-structuralist standpoint by Skalička, who formulated a coherent frame of five major language types: isolating, inflectional, agglutinative, introflectional, and polysynthetic.

The Prague Linguistic Circle's programmatic declaration was formulated in the French *Thèses*, presented to the First Congress of Slavicists, held in Prague in 1929. The major works of the Circle's members were published in the first series, *Travaux du Cercle linguistique de Prague*.

The Postwar Period

The postwar Circle resumed its activities without some of its leading figures: Trubetzkoy and Mathesius had died, and Jakobson had to seek refuge in exile. Jakobson first founded it in Scandinavia and from 1941 in the United States. He became one of the founding members of the Linguistic Circle of New York (1943), and through his teaching, at numerous institutions including Harvard University and Massachusetts Institute of Technology, he helped bridge the gap between European and American linguistics.

In Czechoslovakia, the Prague school of linguistics continued to develop and expand in the work of several generations of the pupils of Mathesius, Jakobson, Skalička, Havránek, Trnka, Trost, and Vachek, such as Miloš Dokulil, František Daneš, Jan Firbas, Oldřich Leška, Ivan Poldauf, and Petr Sgall, and the younger generation constituted by František Ĉermák, Eva Hajičová, Jarmila Panevová, and others. Many of these scholars contributed to the second series, *Travaux linguistiques de Prague*.

Although the official existence of the Prague Linguistic Circle had been terminated, Trnka attempted to continue its activities within the Circle of Modern Philologists by founding, in 1956, one of its specialized groups, devoted to functional linguistics. In 1957, the theses of Prague structuralism were presented in the discussion of linguistic structuralism conducted by the journal *Voprosy jazykoznanija*; in the following year, they appeared in English in the journal *Philologica Pragensia*. After Trnka's death in 1984, the group continued to be convened by his pupil Jiří Nosek, who maintained its activities until the reestablishment of the Circle in 1990.

One of the major developments of the postwar period was the distinction between the center and the periphery, the theme of the second volume of this period's *Travaux*. The center/periphery distinction was regarded as a continuous scalar relation, and linguistic categories were understood as complexes of distinctive features. While central units are basic (simpler), regular, and of high frequency, and have a high functional load, peripheral units are irregular and of lower frequency, and have a low(er) functional load. Thus, for example, the English plural suffix *-(e)s* represents a central device of plural formation, whereas the suffix *-en* is a peripheral one—compare *birds* and *oxen*. Anticipating the prototype theory, the center/periphery distinction has evolved from Mathesius's idea of the potentiality of language phenomena.

Developments in syntax were based on the notion of the verb as the central factor of sentence structure, elaborated in terms of syntactic patterns by Daneš and Zdeněk Hlavsa. Daneš's three-level approach comprised the grammatical structure of the sentence, its semantic structure, and the organization of utterance (its functional perspective, theme/topic–rheme/comment division). Thus, for example, the grammatical structure of the sentence *The boys broke a window* is constituted by the subject, verb, and object; its semantic structure displays the configuration of agent, action, and patient, while its information structure contains the theme (*the boys*, what is spoken about) and the rheme (including the transitional element, the verb, what is said about the theme *broke the window*). A change in word order usually results in a different rheme, for example, *I gave Charles a present* vs. *I gave a present to Charles*.

The division of the sentence into the theme and rheme has been systematically elaborated in the theory of functional sentence perspective by Jan Firbas and his followers and the concept of topic focus articulation in the functional generative description by Hajičová and Sgall. The original conception of the utterance as being composed of a theme and a rheme, basically the "known/new" distinction, has been elaborated, besides other points, in Firbas's approach by a scalar view of communicative dynamism (the amount of information carried by a sentence element).

Another aspect of the discourse level was presented in Poldauf's treatment of grammatical forms with pragmatic functions, such as the "ethic dative" case and particles. A fully explicit, formal, and electronically implementable formulation of the framework of language description has been elaborated by the group of theoretical and computational linguists, Sgall, Hajičová, Panevová, and others, as the functional generative description.

Major developments in lexicology have been made in the field of word formation by Dokulil and in the elaboration of the concept of the naming unit (denomination), introduced by Mathesius, in Ĉermák's treatment of one-word naming units, words, and multiword units, such as *carry out*, *black market*, and *round the clock*.

The past two decades have seen further developments and extension into other spheres, with the support for lexical and grammatical research provided by the recent progress in corpus linguistics. A major role in this respect has been played by the buildup of the Czech National Corpus. A complex system of semiautomatic annotation of texts from the corpus has prepared a basis for the Prague Dependency Treebank. The buildup of parallel corpora has led to a new stage in the pursuit of contrastive studies, the first impulse to which goes back to Mathesius.

Outwardly, this period is characterized by the official existence of the Prague Linguistic Circle,

since 1990, and the publication of the third series, *Travaux du Cercle linguistique de Prague* NS.

Psychological Anthropology

Contemporary psychological anthropology is an interdisciplinary field of study that is situated at the intersection of psychology, psychiatry, neuroscience, philosophy, and anthropology. Practitioners investigate the dynamic ways in which subjective experience, social action, and cultural meaning interrelate in the complex interpersonal worlds of various communities around the globe. Despite a shared overall thematic focus, psychological anthropology is not a singular enterprise. It is instead defined by a number of distinctive, and yet interrelated, approaches. The most prominent of these include ethnopsychology and cognitive anthropology, developmental psychological anthropology, phenomenological and sensorial anthropology, psychodynamic anthropology, and neuroanthropology. While in critical conversation with the fields of cultural psychology, transcultural psychiatry, and cross-cultural psychology, psychological anthropology stands out most strikingly from these because of its ethnographic commitment to exploring the concrete contexts of social life in which the shared and variable aspects of our existence as humans arise.

In broad strokes, psychological anthropology has tended to follow along three distinctive intellectual lineages that at times crosscut the various approaches outlined above: the historical-phenomenological, the comparative-cognitive, and the cultural-psychodynamic. On the historical-phenomenological front are those thinkers who follow Franz Boas's neo-Kantian path toward ethnographically tracing the linguistic, cultural, practical, and material realities that shape the conditions that give rise to possibilities for experience in any one social setting. While influenced by a Boasian interest in discerning the relationship between linguistic-cognitive categories and the shape of lived experience, those following the comparative-cognitive lineage arguably owe just as great a debt to W. H. R. Rivers's early work on color perception, as well as to the innovative experimental work on the cultural patterning of sensory discrimination undertaken by other members of Rivers's research team on the Cambridge Expedition to the Torres Straits (1898). On the cultural-psychodynamic side are those who followed in the footsteps of Bronisław Malinowski's famous critique of Sigmund Freud's Oedipus complex, which highlighted the significance of pursuing ethnographic investigations into the role that culture plays in shaping the intersubjective dynamics and the resulting forms of attachment arising from particular caregiver-infant relationships in differing communities.

While these lineages are distinctive in terms of their various theoretical, analytical, and methodological emphases, all three were set out to emplace cultural differences and interpersonal variations within a broader understanding of what defines the psychological parameters of our human condition, or what Adolf Bastian termed the *psychic unity of humankind*. Yet each approach also shares a critical stance on the potential uses and abuses of psychological theorizing, research, and practice that often

draw from universalizing assumptions about what makes up our distinctly human mode of "being-in-the-world." Such a critical stance is evident in historical-phenomenological critiques of the scientific racism of Herbert Spencer's Social Darwinism; in comparative-cognitive critiques of the unexamined cultural biases inherent in many experimental settings, protocols, and measures; in critical dialogues between psychodynamic anthropology and classic Freudian psychoanalysis; and in more recent challenges to the universality of the psychiatric diagnostic categories outlined in the *Diagnostic and Statistical Manual of Mental Disorders*, which are used to justify the global circulation of psychopharmaceuticals. An interest in examining the relationship between psychopathology and culture, which is embedded in such critiques, is also inherently linked to the history and contemporary development of the field.

Culture and Personality and the "Sapirian Alternative"

Psychological anthropology was defined for time, for better or worse, by an interest in exploring how cultural assumptions and social practices shape the development of locally valued and configured personality types. On the historical-phenomenological side, this found articulation in Ruth Benedict's Gestalt psychological–inspired writings in her book *Patterns of Culture*, as well as in the extended influence her ideas had on the thinking of Margaret Mead, Gregory Bateson, and others. On the cultural-psychodynamic side, we find Abram Kardiner's extension of Bronisław Malinowski's critique of psychoanalysis in the development of the concept of *basic personality structure*, as well as the influence these ideas had on the formulation of the related construct of *modal personality* by Cora DuBois. Collectively, this body of research was known as the culture and personality movement. In its later years, interest in culture and personality shifted to studies of *national character*. This was marked most controversially by Benedict's study of Japanese personality in her book *The Chrysanthemum and the Sword* (1946) and Geoffrey Gorer's so-called swaddling hypothesis, which linked restrained immobility in infancy to adult patterns of character and political authority in Russian society.

The caricatures of preferred personality types that arose at the end point of the culture and personality movement in the 1950s clearly demonstrated problems associated with positing overly homogenized renderings of personality formation arising in the confluence of material circumstances, cultural assumptions, sociopolitical realities, and socialization practices. There were, however, other thinkers writing during this period who offered a very different version of what psychological anthropology could be. Perhaps the most important and underrecognized of these contributors was Edward Sapir.

While Sapir is best known for his early contributions to linguistic anthropology, his later career was marked by a serious engagement with psychology and psychiatry. Sapir's initial interest in psychology stemmed from his engagement with Boas, Benedict, and Mead. His interest in psychiatry arose, however, after witnessing his own wife's struggles with mental illness and her eventual death. This tragic event led to his friendship and collaboration with the psychiatrist Henry Stack Sullivan at the University of Chicago. Inspired by this collaboration, Sapir taught the first ever course on psychological anthropology offered at an American university—"The Psychology of Culture" at the University of Chicago in 1926.

Critical of the overly deterministic cultural theories of human behavior found in the work of fellow Boasians like Alfred Kroeber, Sapir sought instead to highlight how individual experience and concrete interpersonal relations were the only "location" where anything we might term *culture* could be found. While cultural and linguistic traditions thoroughly shape the content and structure of psychic life, individual experiences, perspectives, and reactions "spill over" and "lend color" to such traditions, Sapir argued. Carrying forth his long-standing interest in poetry and creativity, something that also inspired his early fascination with Benedict's dissertation research on guardian spirit visions in Native North American religious traditions, Sapir was reluctant to divest individuals of possibilities for actively responding to and transforming the social and cultural conditions they are also necessarily defined by.

In part inspired by his conversations with Sullivan, Sapir argued that to truly understand the impact of cultural processes on lived experience, it is necessary to examine the concrete interpersonal relations and expressive forms arising within such relations. Seeing both psychology and psychiatry as fields that examine such concrete relations, as well as individuals' actual experiences and responses to them, Sapir held that anthropologists needed to

take a lesson or two from their psychological and psychiatric colleagues. It is, after all, in the context of interpersonal relations that cultural and linguistic forms arise and are transmitted, contested, and transformed. Seeing psychology and psychiatry as often relying on largely unexamined assumptions about the functioning, structure, and shaping of human minds, as well as the forms of psychopathology that afflict them, Sapir also believed that psychologists and psychiatrists needed to learn a lesson or two from their anthropological colleagues, who ethnographically document the variability of human responses, feelings, emotions, ideals, expressive forms, and orientations in human communities.

Seeing the significance of furthering interdisciplinary dialogue, Sapir and Sullivan went on to organize two symposia of the American Psychiatric Association in the late 1920s, which led to a number of National Research Council conferences in Hanover sponsored by the Rockefeller Foundation and the Social Science Research Council. Sapir's involvement with these conferences eventually led to his move from Chicago to Yale in 1934, where he gave his last lectures on psychological anthropology.

It was at Yale that the "Sapiran-Alternative," as Regna Darnell terms it (1986), was articulated in response to the deeply problematic generalizations advanced in the configurationalist work of Benedict and Mead. By focusing on general tendencies and putatively shared traits in particular cultural groups, Sapir argued that Benedict and Mead advanced an "as-if psychology" that failed to examine the actual psychologies of individuals living in the societies they described. Sapir's alternative was to instead focus on concrete individual experiences and the actual interpersonal relations within which such experiences were articulated. As Robert LeVine notes, Sapir's early death prevented him from publishing any programmatic synthesis of his ideas. While his lectures deeply influenced some key figures in the next generation of psychological anthropologists, including, perhaps most important, the young Irving Hallowell (see below), Sapir's contributions to the development of psychological anthropology went unrecognized for many years.

Sapir's Legacy

A student of Boas's student Frank Speck at the University of Pennsylvania, a regular attendee at Boas's seminars at Columbia, and a participant in Sapir's and Sullivan's interdisciplinary conferences, Irving "Pete" Hallowell is arguably one of the most influential advocates of the Sapirian alternative to have contributed to midcentury psychological anthropology. Advocating a phenomenological or experiential approach, Hallowell situated his analysis within a rich ethnographic description of the Ojibwa (Anishinaabe) peoples as a means to demonstrate the distinctive ways in which self-experience is configured in cultural terms. Recognizing the important role that language and socialization practices play in such processes, but weary of overly simplistic and culturally determinative assumptions, Hallowell emphasized the less deterministic language of "orientation" to describe the complex ways in which culture and experience intersect. Borrowing from the Gestalt psychology of Kurt Koffka, Hallowell employed the concept of "behavioral environment" to refer to the culturally ordered environment that is experienced by individual social actors. Cultural assumptions and practices are, Hallowell argued, only "in part" responsible for shaping lived experience, as complex psychological processes significantly contribute to defining any particular self's habitual and ongoing orientations to its behavioral environment.

A student of Hallowell's for a time at Northwestern, but also deeply influenced by Freudian theory, Melford Spiro articulated yet another productive alternative to culture and personality approaches. Arguing against the view that culture and personality are mutually exclusive categories that require a causal mechanism to explain their articulation, Spiro asserted instead that these concepts designate two complementary components of a singular process. In Spiro's view, as in Sapir's and Hallowell's, social interaction is taken to be the generative site through which individual experience is recurrently brought into contact with cultural traditions, and vice versa. For Spiro, it is the specificities of such interactions that lead individuals to variously internalize their culture.

Hallowell's and Spiro's work set the stage for what was to become a deep interest in the complex articulations of psychological and cultural processes in contemporary psychological anthropology. For psychological anthropologists working in the wake of Hallowell and Spiro, culture was increasingly understood in terms of what Anthony F. C. Wallace would call the "organization of diversity" or what Theodore Schwartz would term a "distributed

embodied idioverse," and was not, as it had once been, a determinative catalyst in defining the contours of social life and individual experience. The ensuing reinvigoration of the field led to the development and publication of the Society for Psychological Anthropology's flagship journal *Ethos*, a project initiated in 1973 by the efforts of Walter Goldschmidt and Douglas Price-Williams (who were the founding editors), along with Melford Spiro, Theodore Schwartz, Robert Levy, Douglas Schwartz, John G. Kennedy, George DeVos, and Robert Edgerton.

Developmental Psychological Anthropology

To understand how culture becomes "internalized," even if in distributed or diverse ways, is to raise the core question of socialization. Practically, from its inception, issues of socialization were deemed central to those who contributed to the formation of the field of psychological anthropology. Although, unfortunately, there were still comparatively few anthropologists who actually took on a close study of child rearing, parenting styles, childhood, and development in their ethnographic work. Mead's controversial claims about evidence for differential outcomes in adolescent experience among Samoan girls, as well as her pioneering, and still controversial, critique of Jean Piaget's theories of cognitive development in her work on childhood cognition and imagination in Manus, clearly pointed, however, to the need to look seriously at how early childhood experiences, socialization techniques, and the resulting formations of adult personality were interlinked.

Inspired by Mead's work, as well as by the pioneering work on the systematic ethnographic observation of child socialization practices by John and Beatrice Whiting, important contributions to the field of developmental psychological anthropology were advanced by Robert and Sarah LeVine, Theodore Schwartz, George and Louise Spindler, Elinor Ochs, Bambi Schieffelin, Thomas Weisner, and Sara Harkness, among others. With the effort of these scholars, developmental psychological anthropology expanded in the 1960s, 1970s, and 1980s to include work examining different developmental stages, caregiving strategies, and socialization techniques. This included ethnographic projects that revealed cross-cultural differences in sibling caregiving responsibilities and patterns of residence and cosleeping; research on institutionalized socialization practices ranging from staged ritual initiations to formal schooling; comparisons of the impact of orality and literacy on acquiring particular cognitive competencies; research on language socialization; work on the effects of differing parenting styles on particular developmental outcomes; as well as important ethnographic examinations of informal learning, imitation, play activities, and peer socialization. Returning to Mead's earliest ethnographic interests, some of the most innovative research in contemporary developmental psychological anthropology examines the adolescent experience, including issues of gendered identities and sexuality in postcolonial settings around the globe.

Ethnopsychology and the Anthropology of Self and Emotion

A contributor to, and outgrowth of, the cognitive revolution's reaction to behaviorism in the social sciences in the mid-1960s and early 1970s, comparative-cognitive approaches in psychological anthropology emerged in the guise of ethnoscientific explorations of local knowledge systems and their related schemes of categorization. As evident in the work of Charles Frake, Ward Goodenough, Floyd Lounsbury, Anthony F. C. Wallace, Brent Berlins, and Paul Kay, ethnoscientific research explores how an empirical study of local knowledge systems sheds light on the flexibility and limits of human cognitive capacities in a cultural context. From work on the cultural categorization of colors to kinship relations to local flora and fauna, ethnoscientists developed methodologies for eliciting systems of local knowledge as well as analytical frameworks that could be deployed in an effort to understand and organize them.

As cognitive anthropology developed as a vibrant field of inquiry in the mid- to late 1970s and early 1980s, researchers began to investigate related issues of memory and meaning by means of the concept of "cultural schemas"—a concept that can be ultimately traced back to Sir Fredric Bartlett's notion of "schemata." Such schemas encoded culturally relevant scripts for recognizing and enacting typical forms of social interaction discernible through communicative acts and various forms of expressive behavior. Other important influences on the field included critical appraisals and extensions of Piaget's cognitive-developmental theories in cultural contexts, as well as ethnographic explorations of the cultural mediation of the so-called higher mental

functioning. Much of this work was inspired by the school of Soviet psychology pioneered by Lev Vygotsky.

Important contributions to these various approaches to cognitive anthropology are found in the work of Roy D'Andrade, Kimbal Romney, Naomi Quinn, Russell Bernard, Dorothy Holland, Jeanne Lave, Bradd Shore, Edward Hutchins, James Boster, Claudia Strauss, and Linda Garro. These scholars have examined issues that range from studies of the relations of culture, cognition, and memory to reasoning, narrative practices, and decision making, to the associations between forms of categorization and perceptual processes, to learning and apprenticeship, to motivation.

Sharing a somewhat similar intellectual lineage, although with a rather distinctive trajectory, what became known as the field of ethnopsychology arose from an extension of ethnoscientific work to examination of local understandings of psychological processes. This was, in some respects, also a continuation of the long-standing interest of the Culture-and-Personality school in the cultural patterning of emotions like anger, shame, and guilt. Three of the most influential early contributions to the ethnopsychological tradition include Hildred Geertz's work on the cultural categorization of emotions in Indonesia, Jean Briggs's work on emotional expression and the management of anger in Inuit communities in Canada, and Robert Levy's pioneering person-centered work on self and emotion in Tahiti. Focusing not only on the cultural categories that shape understandings of mind, self, and emotion but also on the interpersonal dynamics and modes of expression that arise from, and in turn pattern, such categories, these scholars provided ethnographically rich and personally nuanced portraits of subjective life as locally configured.

Levy, in particular, left an indelible mark on the further development of the field with his use of person-centered interviewing methods. Loosely based on clinical interviewing techniques, Levy's person-centered interviewing method helped reveal aspects of emotional life that were interpersonally palpable and yet not always fully cognized by the individual who experienced them. Terming such emotions *hypocognized*, Levy argued that while local understandings of emotions deeply affected the ways in which individuals expressed, reacted to, and felt them, there were still registers of feeling that affected individuals regardless of the extent to which they were culturally elaborated, linguistically represented, or explicitly cognized (what Levy termed *hypercognition*).

The early contributions of Geertz, Briggs, and Levy inspired a number of important studies of self and emotions in the late 1970s and early 1980s. This included influential studies of religious experience; the personalization of meaning, healing, and psychopathology in Sri Lanka by Gananath Obeyesekere; and a critical evaluation of the psychiatric category "mood-disorders" in the *Diagnostic and Statistical Manual of Mental Disorders* by Arthur Kleinman, Byron Good, and others. Still other key contributions to the movement included Catherine Lutz's ethnographic insights into Ifalukian understandings of emotion and self-experience in the western Pacific; Michelle Rosaldo's explorations of Illongot concepts of self and feeling in the Philippines; Richard Shweder's investigations of emotional life and personhood in Orissa, India; Edward Shieffelin's research on mourning and affect among the Kaluli in Papua New Guinea; Elinor Ochs and Bambi Schieffelin's work on language socialization and the emotions in Samoa and Papua New Guinea; Geoffery White's examination of the concepts of emotion and person in the Solomon Islands; Uni Wikan's insights into "emotion work" in Bali; Douglas Hollan and Jane Wellenkamp's person-centered analysis of suffering and contentment in Toraja Indonesia; Steven Parish's ethnography of moral personhood in Nepal; Janice Jenkin's insights into trauma and "political ethos" in Salvadorian families; and Nancy Scheper-Hughes's research on schizophrenia in Ireland and on issues of attachment, love, loss, and mourning in Brazil. Focusing less on issues of cognition per se and more on the various ways in which local understandings of selfhood, mind-body relations, emotions, dreams, mental illness, and altered states of consciousness are articulated in local terms, contributors to the anthropology of self and feeling often used their ethnographic insights to critique universalizing assumptions about the structure and function of mental life in the fields of psychology, psychiatry, and philosophy of mind.

Phenomenological and Psychodynamic Anthropology

While each of these thematic, theoretical, and empirical trajectories continue to inform contemporary psychological anthropology, work in the

subfield during the 1990s and 2000s was significantly marked by a shift to examine the cultural formation of embodied subjective experience from the perspectives of phenomenology and relational psychodynamic theories. Overall, both psychodynamic and phenomenological anthropologists share a commitment to exploring the existential ambiguities, ambivalences, dilemmas, and struggles that arise as part and parcel of our emplacement in intersubjective fields of relationality that give rise to the complex dynamics of our social and cultural life.

Arthur Kleinman's, Michael Jackson's, Thomas Csordas's, Nancy Scheper-Hughes's, Margaret Lock's, and Robert Desjarlais's work on experience, existence, and embodiment; David Howes and Contance Classen's call for the establishment of a sensorial anthropology; Tanya Lurhmann's ideas about "interpretive drift"; as well as Byron Good, Mary-Jo DelVecchio Good, Cheryl Mattingly, and Linda Garro's research on narrative practices and illness experience, all importantly contributed to the turn to experience in phenomenologically oriented psychological anthropology. Extending Hallowell's "proto-phenomenological" approach to critical dialogues with the phenomenological philosophies of Edmund Husserl, Martin Heidegger, Maurice Merleau-Ponty, Alfred Schütz, and others, psychological anthropologists inspired by phenomenology have sought to explore the rich textures and complexities of lived experience in its concrete unfolding and social emplacement. Researchers who have employed phenomenological perspectives in psychological anthropology have examined issues of bodiliness, sensory perception, illness and healing, suffering, pain, violence, morality, communicative practices, socialization, aesthetics, the concrete effects of political and economic formations, and subjectivity and intersubjectivity, among other themes and topics.

Working from a rather different intellectual heritage, but terminating in a somewhat similar set of goals for the subfield, proponents of psychodynamic anthropology extended Levy's interests in person-centered ethnography and Gananath Obeyesekere's influential work on the "subjectification" of culture to an engagement with the self-psychologies, object-relations, and relational psychodynamic theories of Heinz Kohut, Melanie Klein, Donald Winnicott, Hans Loewald, Stephen Mitchell, and others. The work of Jacques Lacan is yet another important influence on contemporary psychodynamic anthropology, particularly for those who seek to integrate political and postcolonial theory into their analysis.

Key contributors to the development of contemporary psychodynamic approaches in psychological anthropology include Waud Kracke, Gilbert Herdt, Douglas Hollan, Nancy Chodorow, Stephania Pandolfo, and Byron Good. Each have contributed crucial ethnographic investigations into the complex intersubjective dynamics configuring, and configured by, dream life, imagination, fantasy, desire, attachment, social suffering, processes of somatization and psychologization, trauma, illness experience, psychopathology, "postcolonial disorders," empathy, and care taking in the lives of specific persons and communities around the globe.

Clinical Anthropology and Neuroanthropologies

Finally, two important recent developments in contemporary psychological anthropology are the establishment of a clinically focused psychological anthropology and a burgeoning interest in neuroanthropology. The former approach stems from psychological anthropologists' long-standing research in clinical settings, as well as interest in the global circulation of, and local responses to, clinical techniques and psychopharmaceutical interventions. It also arises from the dual, clinical, and research duties that a number of psychological anthropologists undertake in light of the training they have received in psychiatry, clinical psychology, psychoanalysis, and social work. The latter tradition owes a significant debt to the pioneering work of Charles Laughlin, Eugene D'Aquili, and John McManus, who set out to explore in the 1970s, 1980s, and 1990s, the productive intersection of neuroscience, anthropology, and psychology. In its most recent guise, neuroanthropology has generatively explored how insights into issues of neuroplasticity, embodiment, subjective experience, imitation, intersubjectivity, empathy, development, and psychopathology, all made possible by ongoing developments in neuroscientific imaging technology, can contribute to theory and research practices in anthropology and the social sciences more generally.

Public Sphere

Studies of the public sphere build on the seminal work by the German philosopher and sociologist Jürgen Habermas. The public sphere, a social space between the family and the state, is a crucial dimension of a democracy, in which citizens come together as private persons to discuss issues of public concern. According to Habermas, socioeconomic differences or inherited ideas *should* not influence citizens' collective deliberation. Rather, arguments should be judged on their own merits—that is, by assessing (on a rational-critical basis) the strength of their justifications in an open, egalitarian, and inclusive dialogue, thus leading to the formation of shared public opinion. Examples of such public spheres include newspapers, magazines, coffee shops, websites, and other social domains of civic engagement. Via the public sphere, citizens exert some control on the state and press their elected officials to represent their constituents' evolving concerns and projects for social change. The public sphere is at once a descriptive category, indicating some constitutive aspects of democracy, and a normative category, on the basis of which social change can be assessed or promoted.

Within anthropology, the public sphere is viewed as a useful analytical construct to analyze postcolonial contexts, in particular the formation of new forms of community and social participation transcending or redefining ties of kinship, ethnicity, and patronage. Anthropologists' interest in the theory of the public sphere reflects their growing dissatisfaction with a narrow understanding of cultural relativism and their search for more satisfactory mediations between understanding people in their own terms and cultivating new forms of transnational partnership. Anthropologists offer important correctives to West-based normative conceptions of the public sphere. For example, by exploring how socially grounded positions and modern power continue to affect people's participation in the public sphere, they question the applicability of the public sphere construct as necessarily entailing certain egalitarian transformational processes. They also explore the usefulness of this construct to investigate other dimensions of social life beyond the narrowly conceived political one.

Some anthropologists and religious studies scholars have insightfully developed a modified concept of the public sphere to describe the transformation of religious communities and people's forms of religious participation. For instance, the anthropologists Robert Launay and Benjamin Soares trace the emergence of a relatively unified Islamic sphere in French Sudan (today's Mali, West Africa) under French colonization. Via conversion and participation in the Islamic sphere, people of that region developed a new, more individualized sense of self. They came to transcend localized identities such as kinship and ethnic alliances and forged new alliances with representatives of the wider Muslim world. Debates in the religious sphere were centered on issues of public concern, although their articulation did not necessarily follow Habermas's rational-critical model. They mediated changing forms of historical consciousness and reflected continual social and cultural transformations within the religious sphere and beyond. Such an approach contributes to a more nuanced and historically grounded understanding of religious communities. It questions simplistic oppositions between the sacred and the profane, thus opening a more nuanced discussion on the contexts and modalities of collective participation and public engagement.

Other anthropologists explore how people's socially grounded positions, in particular their gender identity, continue to be reflected and are further articulated in their participation in the public sphere. Analyzing readers' letters to "Prescriptions," a column in *Femina* (a widely read women's magazine in India), the anthropologist Susan Dewey suggests that the column represents a parallel public sphere in which women at the margins publicly discuss and

address their private concerns, particularly about highly stigmatized topics such as rape and domestic violence. Yet such forms of public participation do not have a substantive transformational effect on the lives of these women; indeed, communication in the parallel public sphere ultimately reconfirms the importance of modesty and honor as guiding values regulating women's conduct. Dewey's analysis shows how participation in the public sphere (around private topics) and social marginality may be mutually constituted.

Finally, some anthropologists explore the transnationalization of the public sphere emerging from people's often devastating experiences with displacement, violence, civil wars, and escalating poverty. Victoria Bernal investigates *Dehai*, a website established by members of the Eritrean diaspora, as a transnational public sphere situated between Western media coverage of Eritrea and the Eritrean national press. *Dehai* simultaneously enables Eritreans in the diaspora to partake in the construction of Eritrea as an independent nation as well as to experiment with new forms of community and socialization to overcome the isolation they experience in the diaspora. Despite some of the messiness and limits recorded in the actual working of this transnational public sphere (e.g., violence, censorship, gender disparity), the author concludes that, via Dehai, Eritreans in the diaspora experiment with new forms of community and communication that also draw Eritreans back home into more open dialogues around issues of public concern, including women's status, religious concerns, and policy changes.

In sum, the public sphere provides anthropologists with a useful framework to address changes in community forms in postcolonial situations. Some anthropologists have used the concept of the public sphere to study religious communities and social changes, showing how the religious sphere contributes to the modernization of postcolonial societies. Others have focused on how people's socially grounded positions and power differentials are reflected and further articulated in people's participation in the public sphere. Yet others explore the emergence of a transnational public sphere and its impact on notions of citizenship, nationalism, belonging, and civic engagement. Overall, anthropological studies of the public sphere reflect practitioners' increasing interest in exploring interpretive frameworks that can also contribute to social change.

Queer Theory

Queer theory is an interdisciplinary field of inquiry that emerged in the 1990s at the intersection of feminist theory, gay and lesbian studies, poststructuralist philosophy, and women's and gender studies. Characteristically, practitioners of queer theory challenge structural inequalities grounded in gender and sexuality by critically engaging heteronormative categories and conventions. Though primarily associated with humanistic disciplines, queer theory is indebted to and influential in queer studies in anthropology.

The Term "Queer"

The word *queer* sometimes functions as an umbrella term, encompassing those who identify as gay, lesbian, bisexual, transgendered, intersex, and two-spirit; additionally, the term is sometimes used in relation to heterosexuals involved in nonnormative sexual subcultures and practices, such as polyamory and sadomasochism. When used in this way, the category is meant to be more inclusive than the acronym LGBT (lesbian, gay, bisexual, transgendered). Sometimes, however, "queer" is included as a specific category within the more expansive acronym LGBTQQI2SA (the latter parts referring to queer, questioning, intersex, two-spirit, and asexual, respectively). Queer-theoretical and -anthropological perspectives emphasize the cultural and historical specificity of categories, framing various forms of queerness in terms of contingent cultural constructions rather than as transhistorical, essential universals.

In the contemporary United States, the word *queer* is increasingly embraced by those who fall under its banner. Historically, though, queer was a derogatory term, its negative connotations stemming from its etymology (the German root *quer*, meaning "oblique" or "perverse") and from its earlier use in referring to people deemed odd or unusual. Current self-identifications as queer can be seen in terms of a project of reclamation, steeped in the aftermath of the identity politics of the 1990s generally and as a legacy of the radical activist group "Queer Nation" in particular. In this current usage, "queer" signifies fluidity, transgression of boundaries, and reterritorialization of static and binary forms of identity, thus challenging normative classifications, ideologies, and practices. In this way, "queer" has shifted from an ontological status to an epistemological stance. Grammatically, it now functions not only as an adjective or noun but also as a verb.

Queer Theory's Canonical Foundations

The phrase "queer theory" was coined by Teresa de Lauretis as the title for a conference she held at the University of California, Santa Cruz, in 1990. Central to queer theory is the destabilization of categories, especially the universalizing of the hierarchical binaries man/woman and heterosexual/homosexual, in favor of the recognition of fluidity in experience and identification across time and space. Two important precursors to queer theory are the poststructuralist philosophers Michel Foucault and

Jacques Derrida. In *History of Sexuality*, Foucault argued that the "speciation" of the "homosexual" as a type of person is a historically specific phenomenon, an idea that underpins subsequent social constructionist arguments in queer studies. Also influential is deconstruction, an interpretive method developed by Derrida in his work *Of Grammatology*. The influence of Derrida's observations about "violent hierarchies," in which one term of a binary is constitutively privileged, can be seen throughout queer-theoretical work.

Two texts considered foundational in queer theory, both published in 1990, are Eve Panofsky Sedgwick's *Epistemology of the Closet* and Judith Butler's *Gender Trouble*. Sedgwick argues for the symbolic centrality of the seemingly marginal topic of hetero- and homosexuality in the structuring of contemporary Western thought. Central to Sedgwick's *Epistemology* is her critical interrogation of the work of categorization, emphasizing the importance of differences across categories as well as within them. In *Gender Trouble*, Butler develops a performative theory of gender, a theory that underpins key subsequent writings such as *Bodies That Matter* (1993), *Excitable Speech* (1997), and *Undoing Gender* (2000). Her work centers on showing how gender is better understood as an act, something one *does*, than as an internal essence, something one *is*. For Butler, gender is manufactured through repetitive and compulsory ways of inhabiting a body in relation to categories that make it intelligible. She rethinks gender as regulatory norm rather than as interior essence. In doing so, she uses a philosophical consideration of non-normative sexual practices to denaturalize gender as an analytic category.

Anthropology's Role in the Emergence of Queer Theory

While both *Epistemology of the Closet* and *Gender Trouble* are grounded in humanistic disciplines, Butler and Sedgwick are both influenced in part by anthropological writings. Both these canonical texts in queer theory reference earlier works of Esther Newton and Gayle Rubin, two pioneering figures in queer anthropology. Esther Newton's monograph *Mother Camp* was published in 1972. This work, an ethnographic study of professional drag queens in Chicago, examines female impersonators as performing homosexuals and homosexual performers. Newton draws on the sociological theories of Erving Goffman, referencing his works *Stigma* and *The Presentation of Self in Everyday Life* in developing her analysis. This work with the concepts of stigma and self-performance begins to prefigure queer-theoretical interests in the metaphor of the closet, the notion of performativity, and the disruption of normative binaries. Moreover, Newton offers an ethnographic grounding for the development of these ideas.

In her 1975 essay "The Traffic in Women," Gayle Rubin develops the concept of "the sex/gender system" as a way to examine the transformation of biological sex into cultural gender, a historical work of naturalization so ceaseless that access to sex itself becomes mediated through the social construction of gender. Subsequently, however, in her 1984 essay "Thinking Sex: Notes to a Radical Theory of the Politics of Sexuality," Rubin revises this position, arguing for an understanding of gender and sexuality as analytically distinct. "Thinking Sex" also introduces the concept of "The Charmed Circle," a system of binary oppositions, such as heterosexual/homosexual, vanilla/kinky, whereby the former term is privileged as good in contradistinction to the latter. Rubin shows how the intersection of these distinctions as they empirically exist in combination leads to a complex "ladder of social acceptability," of which married, monogamous heterosexual couples are the apex. In this multivariate framework, some forms of sexuality—such as unmarried heterosexuals and long-term gay and lesbian couples—occupy a liminal state deemed potentially eligible for acceptance, whereas others—such as commercial, kinky, and cross-generational sex—are deemed beyond the pale. Rubin's work, too, prefigures and inspires key concepts in the seminal writings of Butler and Sedgwick, both of whom take up her essays explicitly.

Queer Theory and Queer Anthropology

Despite these interconnections, disciplinary differences between literary-cultural studies and anthropology reflect a divergence between "queer theory" and anthropological writings on queer topics. Central to this divergence is a tension between normative and empirical claim-making practices. Characteristically, queer studies are engaged in

critiques of heteronormativity. In humanistic theoretical writings, these critiques tend to take the form of an antinormative stance such that, within queer theory, anti-normativity itself becomes a norm. In anthropological writings, however, theorizations about queerness tend to foreground the ways in which actual people undo, resist, challenge, and remake norms, focusing on how everyday practices disrupt hegemonic ideologies, heteronormative, androcentric, Eurocentric, and otherwise.

A key text in queer theory as an antinormative philosophical project is Michael Warner's book *The Trouble With Normal*, published in 1999. Warner argues that an idealization of sexual normality is grounded in a politics of sexual shame. Moving from abstract to concrete, he applies his philosophical framework to gay marriage, which he reads as a regressive reincorporation of queerness into a heteronormative model that might otherwise be challenged. Similarly, in *Gaga Feminism* (2012), J. Jack Halberstam outlines an opposition to gay marriage on queer-theoretical grounds, arguing that embracing "marriage" weakens more radically antinormative stances, such as a wholesale rejection of the institution and its exclusionary privileges.

Likewise influential is the "anti-relationality thesis," advanced by Leo Bersani in *Homos*, published in 1995. Through a reading of André Gide's novel *The Immoralist*, Bersani justifies the stance implied by the novel, interpreting the text as even *more* subversive and threatening to dominant social order than it would have been had the protagonist embraced his homosexuality. Thus, for Bersani, the subversive potential of queerness resides in the radical dismissal of relationality, enabled by rejection of familial or contractual relationships based on a heterosexual model. This thesis gets debated in later queer-theoretical texts. Lee Edelman, in *No Future* (2004), embraces the antirelational stance, arguing for a rejection of futurity and its master symbol, the child. José Esteban Muñoz, in *Cruising Utopia* (2009), critiques the antirelational position, arguing for queerness as collective. He remains committed, however, to a philosophically antinormative characterization of queerness as a rejection of the here and now. Conversely, in queer anthropology, theoretical innovation gets positioned as emerging out of ethnographic engagement. Two groundbreaking monographs, Kath Weston's *Families We Choose* (1991) and Don Kulick's *Travesti* (1997), exemplify this characteristically anthropological approach. Weston shows how gays and lesbians, thought to be "exiles from kinship," form families of friends, thereby inhabiting idioms of kinship in alternative and creative ways. Kulick shows how *travestis*, Brazilian transgendered prostitutes, are invested not so much in a masculine/feminine binary on the basis of anatomical sex as they are in a binary of the sexual role positions of penetrator and penetrated around which to organize their subjectivities. Both anthropologists deploy ethnographic insights in ways that trouble received heteronormative wisdom, but they construct their arguments descriptively rather than in terms of an a priori theoretical commitment to anti-normativity as such.

Within cultural anthropology, studies on queer topics consistently address several theoretical problems. One consists in what Kath Weston has called "ethnocartography," locating cross-cultural examples of non-normative practices involving gender and sexuality. An important classic example of this phenomenon is Gilbert Herdt's work on "ritualized homosexuality" in Melanesia. More recently, anthropologists have grappled with the extent to which analytic categories translate cross-culturally, an issue taken up in the works of Evelyn Blackwood, Tom Boellstorff, Martin Manalansan IV, and David Valentine, among others. Key developments in queer anthropology can be traced through a series of volumes edited by Ellen Lewin and William L. Leap, which critically engage the paradigm of being "out" as a central basis of ethnographic work on queer topics. Though queer-anthropological writings speak to questions central to the discipline, from kinship to globalization, queer anthropology has tended to be marginalized within the field as a whole.

Likewise, anthropological works and methodologies have tended to be marginalized in humanistic queer studies. However, some recent works outside anthropology have begun to move beyond this theory/ethnography opposition. Two prominent examples are Jasbir Puar's (2007) *Terrorist Assemblages*, which develops the concepts of "homonationalism" and "homonormativity" in its critique of how the acceptance of certain forms of queerness depend on the production of other constitutive exclusions, in terms of race, class, sexuality, and religion, and Tim Dean's (2009) *Unlimited Intimacy*, a study of the subculture of "barebacking," or having unprotected sex. Drawing in part on participant observational

methods, while also being deeply engaged with textual analysis and philosophical questions, these works speak to the productive potential of keeping queer theory and queer anthropology in conversation.

Queer Anthropology in a Professional Context

Theoretical transformations in queer studies are reflected in matters of professional organization. The section of the American Anthropological Association focusing on queer anthropology originated as the Anthropological Research Group on Homosexuality. In 1987, this group became the Society of Lesbian and Gay Anthropologists. This first shift, from "homosexuality" to "gay and lesbian," reflects a movement from experience-distant scientific approaches characteristic of the sociology of deviance to the embrace of experience-near and identity-based formulations, which had strong currency in the 1990s. The Society of Lesbian and Gay Anthropologists achieved formal recognition as a section of the American Anthropological Association in 1998. In 2009, the Society of Lesbian and Gay Anthropologists became the Association for Queer Anthropology. This most recent shift signposts the increased inclusion of transgendered and two-spirit persons and other ethnographically distinct forms of sexuality that cannot be equated with or reduced to terms like *gay* or *lesbian*. This move aligns with anthropology's characteristic attention to the limits of commensurability across cultures. Likewise, the newest incarnation of the title moves away from an explicit assumption of a correspondence between subject matter and researcher identity.

R

Rabinow, Paul

Paul Rabinow (1944–) is an American anthropologist. He is best known for his distinctive approach to modernity and the contemporary and for his works on the French historian and philosopher Michel Foucault. He is currently professor of anthropology at the University of California, Berkeley.

Early Life and Works

Paul Rabinow was born in Florida in 1944. His family moved to New York City when he was a small child. He attended Stuyvesant High School in Manhattan and went on to the University of Chicago, where he pursued both his undergraduate degree and later his PhD in anthropology. Rabinow's undergraduate years provide the backdrop for his later thinking. He has often cited the philosopher Richard McKeon, a student of John Dewey's, as a crucial figure in his early intellectual development at the University of Chicago. But it was also a more general feature of the intellectual climate at Chicago in the early 1960s that proved formative for Rabinow. Chicago's curriculum, classical and rigorous, embodied an intellectual tradition that was to be taken as a whole. Rabinow's position has never been to reject the philosophical and literary tradition in which he was trained at Chicago but rather to historicize and explore the grounds of its coherence and authority.

As a graduate student at Chicago, Rabinow studied under Clifford Geertz. At that time, Geertz was overseeing a collaborative project in Indonesia and Morocco. While the goal was to ultimately synthesize and compare the research findings, individual research projects in Geertz's network were stand-alone contributions. Rabinow set off for the Middle Atlas Mountains in 1968 as a member of Geertz's group. There he conducted immersive fieldwork and subsequently completed a dissertation, which became the book *Symbolic Domination: Cultural Form and Historical Change in Morocco*, first published in 1975. The monograph examines the interrelation between symbolic forms and social and political context, arguing that historical transformations had produced tensions between the core symbolic forms of a group of Moroccan religious leaders and a rapidly changing Morocco. *Symbolic Domination* reflects the early influences of Geertz and Max Weber on Rabinow's thinking. From Geertz, Rabinow inherited the aims of an interpretive social science and a concern with the symbolic negotiations involved in historically situated social processes (something that Geertz himself took largely from Weber) and from Weber, a conceptual toolkit for discussing domination and legitimacy and a concern with the interrelation between religion, and social forms and values.

Rabinow's work in the Middle Atlas also resulted in a second book, *Reflections on Fieldwork in Morocco* (1977), perhaps his most widely read (and widely taught) work. At the time of its writing, Rabinow held a professorship at Richmond College (1970–1978), but the book reflects Rabinow's engagements with Pierre Bourdieu and Robert Bellah at the Institute for Advanced Study

in Princeton (1971–1972). Though *Reflections* echoes themes from both Hegel's *Phenomenology of Spirit* and Lévi-Strauss's *Tristes Tropiques*, it is cast as an autobiographical account of fieldwork as an experiential process. At the time of its writing, Rabinow had been a proponent and a practitioner of the interpretive approach in anthropology. In the introduction to a reader titled *Interpretive Social Science* (1988), Rabinow observes, with William Sullivan, that the 20th century was a sobering one for grand historical theory. The evolution of society was recast as a mixture of chance and imperialism. This recasting meant that the social sciences were in need of some redefinition. Structuralism seemed to offer one kind of curative. But the fitting of human activity to abstract formal operations requires that at a certain point in the investigation the context of human action melt away. It was this last step to which Rabinow, like Geertz, was resistant.

Instead, the interpretive approach in anthropology treated culture as a set of meanings to be deciphered. The anthropologist's task, then, was to interpret these meanings, which he or she gained familiarity with through cultural immersion during fieldwork. The interpretive approach tended to focus investigation on the content of human action. But to posit that culture required interpretation was also to acknowledge that the anthropologist was situated in cultural meanings and context, which figure prominently in field encounters. Therefore, Rabinow observed, the taken-for-granted nature of fieldwork, and its relationship to ethnographic monographs, was in dire need of some critical attention. Thoroughly ahead of its time, *Reflections* reflected on fieldwork as a deeply experiential, messy process that destabilizes Self and the Other. And its message was that knowledge of an Other was always situated not only in historical antecedents and power relations but also in words, gestures, and relationships. *Reflections* casts doubt on interpretive anthropology's grounding in fieldwork. But the implication was not that fieldwork is doomed but that it must be evaluated in light of contemporary problems and that new forms of inquiry and new genres of writing might be in order. Nonetheless, after its writing, and with his discovery of the works of Michel Foucault, Rabinow largely turned away from interpretive work.

Seen in hindsight, these early interventions in the dynamics of fieldwork had an unexpected and not always salutary career. Culminating in the late 1980s in the volume *Writing Culture* (1986), which has left an indubitable mark on anthropology and to which Rabinow contributed a chapter, these critiques challenged ethnographic authority and dissolved the seamless relationship between the anthropologist as a field-worker and as an author. But the result, as Rabinow and others have lamented, has often been a turn toward subjectivism, lacking in standards of assessment. This was not the aim of *Reflections*, or of the *Writing Culture* critiques, but it has been a big part of their legacy.

Writings on Michel Foucault

In 1978, Rabinow joined the anthropology department of the University of California. The following year, Rabinow attended a seminar given by Hubert Dreyfus and John Searle, in which Michel Foucault was portrayed as a structuralist. Rabinow disagreed with the characterization, thereby launching a collaboration with Dreyfus that resulted in their book, *Michel Foucault: Beyond Structuralism and Hermeneutics* (1983). Foucault had taken a visiting professorship at Berkeley that coincided with the writing of the book. He proved a willing interlocutor and penned the afterword. In the book, Rabinow and Dreyfus argued that Foucault had combined elements of structuralism and hermeneutics to form a method they called "interpretive analytics." Interpretive analytics retained some of the formal characteristics of structuralist thought, while historicizing the very foundation of the social sciences, for which the human appeared as both subject and object.

Rabinow has emerged as one of the foremost commentators and discussants of Foucault's methods and concepts. Beyond commenting on Foucault's works and exploring their ramifications, Rabinow's own thinking has been deeply tied to Foucault's. While many of Rabinow's more theoretical works have delved into Foucault's writings, it is perhaps his fourth book, *French Modern: Norms and Forms of the Social Environment* (1989), that most clearly explores the Foucauldian method and problem. Foucault had written a number of works he characterized as histories of the present. These works denaturalized the categories and objects of the present by tracking their historical formation. Rabinow's *French Modern* is a history of the present that looks at the formation of French social modernity, focusing on urban planning. In the book, Rabinow argues that the notion of society we take for granted today took shape in France in the early

19th century, through shifting configurations of power and knowledge.

Biosociality and the Life Sciences

After completing *French Modern*, Rabinow turned to the life sciences and techno-science to track the modernization of the notion of "life." Rabinow undertook this project as part of what he termed the anthropology of reason, which explored the changing relationship between truth claims and values in contexts of shifting power relations.

Rabinow's inquiry into the life sciences began with something between a prophecy and a diagnosis. Rabinow identified an inchoate transformation, which he hypothesized would change what it means to be a living being in the decades to come. We are entering a period of "biosociality," he argued in the early 1990s. The term has proven influential in science and technology studies and in medical anthropology, capturing a crosscurrent to the sociobiology debates of the preceding decades. Marshall Sahlins, among others, had argued that sociobiology, for which social life was largely biologically determined, was itself pervaded by a bourgeois cultural logic. Thus, sociobiologists were remaking nature in society's image. Rabinow largely agreed with this characterization, but he observed that molecular biology and genetics would themselves become the basis of a new sociality. And since the technological aims of knowledge and intervention were combined in genetics research, the outcome would be a society based on synthetic nature. Such a society reflected the penetration of techno-science deeper and deeper into what was once Nature's stronghold. For Rabinow, therefore, biosociality would bring us closer to overcoming the nature/culture divide.

Rabinow's subsequent works examined genetics research in diverse contexts. He conducted fieldwork at biotech companies and academic institutions in France, Iceland, and the United States. His works on genetics research include *Making PCR: A Story of Biotechnology* (1997), *French DNA: Trouble in Purgatory* (1999), and *A Machine to Make a Future: Biotech Chronicles* (with Talia Dan-Cohen, 2004).

Anthropology of the Contemporary

In the late 1990s, Rabinow began to move past a concern with modernity, instead laying the foundations for a new anthropological endeavor that he called the anthropology of the contemporary. For Rabinow, to focus on the contemporary marks an attempt to move self-consciously past epochal terms. The anthropology of the contemporary also provides an alternative to both postmodernism and globalization, two dominant answers to the question "What comes after modernity?" The anthropology of the contemporary is attuned to emergence and focuses on the recent past and near future. It builds on the observation that without a grand historical *telos*, the new ceases to dominate by virtue of being new. It borrows Foucault's notion of assemblage, tracking the often contingent coming together of old and new elements. Sorting out situations that are consistently underdetermined involves careful conceptual honing, something that Rabinow has undertaken in a number of works, including *Anthropos Today: Reflections on Modern Equipment* (2003), *Marking Time: On the Anthropology of the Contemporary* (2008), *The Accompaniment: Assembling the Contemporary* (2011), and *Demands of the Day* (2013). Alongside these works, Rabinow has devoted some attention to creative modes of collaboration and new venues for thinking through and sharing problems in the anthropology of the contemporary. His inquiries range from studies of genetic technologies in the United States and France to formulating human practices for the emergent field of synthetic biology. And he has coauthored works and performed collaborative fieldwork with students and colleagues.

The anthropology of the contemporary seeks to provide anthropologists interested in contemporary practices—be they genetics, market, law, or others—with appropriate tools to replace the residual ethnographic paraphernalia that was fitted to a different time and a different set of problems. For that task, Rabinow has argued for an anthropological practice that revolves around concepts and cases rather than theory and ethnography. Concepts help organize and think through specific problems encountered in fieldwork. As such, they are oriented toward the concrete and must be reworked for different cases. Their flexibility makes them more appropriate for chronicling the emergent.

While earlier in his career Rabinow took part in more mainstream attempts to revamp anthropology so as to produce continuity between its past and its present, his more recent work has been less concerned with disciplinary coherence. Rabinow's own contemporary concepts, drawn from the works of John Dewey, depart sharply from the familiar

anthropological set. How these concepts will be received and used is yet to be determined.

Race

Anthropology's concern with race dates back to the discipline's 19th-century beginnings, when it defined itself as the scientific study of the *races of man*. Concepts and explanations of race have been closely tied to the development of and the shifts in anthropological theory in general. The diverse peoples, cultures, and societies that constitute anthropology's intellectual focus have been conceptualized in contradictory terms. The notion of psychic unity that the German ethnologist Adolf Bastian formulated underpinned the comparative study of humankind. Societies and cultures located beyond the boundaries of Western civilizations, many of which were classified then as "primitive," were assumed to possess the collective cognitive capacities to evolve according to a logic of progress and perfectibility and, hence, to become "civilized" eventually. However, civilization was envisioned according to European and Euro-American criteria. The earliest theories of evolution essentialized sociocultural differences in a manner that assigned the majority of the world's peoples to distinct temporalities. Non-Western societies—as well as the folk, peasant, nomadic, or otherwise low-status ethnic minority segments within Western societies—were rendered as living fossils from the evolutionary past, in contrast to the societies marked by progress, later to be construed in terms of modernity and development.

Scientific Racism and Its Contenders

While psychic unity emphasized the common denominators among all human beings, the positive implications of this concept were offset by commonly held biologically determinist assumptions that conflated nature, or biology, with culture. This translated into the notion that primitive culture was correlated with or the result of biological inferiority. The biologization of sociocultural variation was most evident in the early phases of physical anthropology. Those endeavors were preoccupied with measuring the anatomical (especially cranial) differences that marked supposedly higher and lesser forms of humanity, framing the results in racial taxonomies. In the most extreme cases, polygeneticists manufactured typological evidence to make the case for separate origins and, hence, for species-like distinctions between Europeans and their colonial subjects, particularly sub-Saharan Africans, whose purported inferiority and radical otherness helped justify the capture of labor power by means of enslavement. Monogenetic interpretations were also problematic in their racist assumptions concerning the purported "degeneration" of non-Europeans from the ideal human form developed from a single genesis.

Joseph Arthur Comte de Gobineau's 1853–1855 treatise *An Essay on the Inequality of the Human Races*, argued the natural superiority of the Aryan race. In 1885, the Haitian ethnologist Joseph Anténor Firmin published a counterargument in *The Equality of the Human Races*. In addition to its value as critique, the treatise instantiated an approach to a more methodologically sound anthropology. In good part due to the silencing of Haitian voices and historical agency, Firmin's theory had limited impact at that time.

Social Darwinism permeated much of the anthropology of the late 19th and early 20th centuries,

contributing to a racial worldview. Franz Boas intervened with the argument that race (visible markers of human variability), language, and culture were distinct. His idiographic theory of historical particularism represented a major departure from evolutionary thinking. Boasian antiracism, in dialogue with W. E. B. Du Bois's parallel theorizing on "the color line," marked a major break away from the dominant paradigm of scientific racism. By the early post–World War II period, the Boasian school had consolidated its validity and set the standard for the entire disciplinary field.

Perspectives During the Pre- and Postwar Period

During the 1930s and 1940s, anthropological inquiry on race in the United States was informed by Malinowskian functionalism and A. R. Radcliffe-Brown's structural functionalism. These perspectives were sometimes brought into uneasy conversation with other theoretical discourses, such as the Marxist ideas circulating during the Great Depression. The 1933–1935 collaborative ethnographic research that Allison Davis, Burleigh Gardner, and Mary Gardner undertook in Natchez, Mississippi, resulted in an analysis of the structure and function of race as it was related to class. It also inscribed a form of theoretical border crossing. In their 1941 *Deep South*, they conceptualized race through the lens of caste to underscore the workings of a historically constituted and power-mediated *social* distinction intertwined with class. Besides the influence of British social anthropology, the study engaged Marxist assumptions concerning political economy, conflict, and violence.

Theoretical eclecticism continued in St. Clair Drake and Horace Cayton's 1945 *Black Metropolis*, where the authors used structural functionalism and Marxist and Weberian ideas in an attempt to illuminate African Americans' navigation of Chicago's landscape. Drake's later study of a multiracial port district in Cardiff, Wales, addressed similar problems from the vantage of the families and the community of African and Arab seamen, whose social status was marked by both racial subordination and colonial subjection. Also beginning to work in the United Kingdom around that time, Michael Banton examined race relations in England. By the 1960s, he started to look beyond the social structural approach to explain the conflict situations that discrimination engendered in various social domains, including police-community relations. In his later analysis, he employed rational choice theory. This shifted his analytical focus from structure to social actors, who assess costs and benefits in making choices.

Materialisms, 1960s to the Present

While Marxism was a notable source of theory, it was submerged in less politicized materialisms (e.g., cultural ecology) throughout most of the 1950s in the United States due to the McCarthy Era hostilities toward the political left. For example, Marvin Harris drew from Marx's emphasis on production and Malthus's focus on demographic factors. Harris reworked Marxist notions of base (infrastructure) and superstructure, while rejecting its dialectic. To explain the varied, historically contingent racial formations in the Americas, he adumbrated an approach he later elaborated as the scientific paradigm of cultural materialism in his 1968 book *The Rise of Anthropological Theory*.

Harris's seminal study compared "patterns of race" across three ecological zones: (1) the temperate, (2) the highlands, and (3) the tropical/subtropical coastal lowlands. He explained the development and deployment of varying forms of racial classification in the context of material realities—the ecological, demographic, and techno-economic conditions that shape the levels of structure and superstructure. He posited that the interplay between productive and reproductive forces determined the cultural logics of racial classification (e.g., the U.S. hypodescent and the Brazilian color continuum or "racial calculus").

In later work, other materialist views of race were asserted, some of which were explicitly framed within Marxism. Bernard Magubane applied Marxist concepts to examine the political economy of race and class in South Africa. Eric Wolf's magisterial *Europe and the People Without History* (1982) brought Marxist categories to his anthropological history of world capitalism and its expansionist articulations with diverse local and regional economies populated by "people[s] without history." Within this context, racial distinctions emerged from historical processes that converted populations of entire continents into coerced labor. In later phases of capitalist development, these categories retained their stigma, resulting in exclusion from the higher

echelons of employment and society. Furthermore, Eleanor Burke Leacock's Marxist feminism yielded significant theoretical insights into the development of women's subordination in the context of a deeper history of more egalitarian periods of gender relations. She also analyzed the interplay of culture, race, and poverty.

Another Marxist feminist whose theorization of race has been significant is Karen Brodkin. Contributing to a unified theory of race, gender, and class, she sought to explain "how Jews became white" after being initially relegated to the margins of whiteness. She sees race as a material relation articulated to class and gender, central to the means of capitalist production. In her 1998 American Ethnological Society address, "Global Capitalism: What's Race Got to Do With It?" (published in *American Ethnologist* 2 years later), she argued that race and class are "mutually constitutive, two facets of the same process that apply to both the structure of productive relationships and people's consciousness or identities." Gender is also integral to this process; its constructions make race "corporeal, material, and visible."

There are also other materialisms that interrogate race and racism by drawing on interpretive perspectives associated with postmodernism and poststructuralism: culture and political economy, reflexive political economy, and multiracial feminisms. They acknowledge the materiality of race while being attentive to the intersubjective dynamics of identity, discursive practices, and structures of feeling, whose salience exceeds the limited "superstructural" role that more orthodox materialisms allow.

Postmodernist/Poststructuralist Perspectives

The postmodernist turn contributed to the shift from nomothetic theory and grand narratives toward more idiographic analyses of diverse trajectories of discourse, practice, and identity. In her 1995 *Colonial Inscriptions: Race, Sex, and Class in Kenya*, Carolyn Martin Shaw examines the racial, class, and sexual politics in the formation of political subjects in colonial Kenya. Her analysis of plural and interlocking subjectivities among both European settlers and Africans is informed by a synthesis of post-Marxism and poststructuralism, and her analysis draws on her critical reworking of Michel Foucault's theory of knowledge.

Another take on racial discourses comes from the linguistic anthropologist Jane Hill, whose *The Everyday Language of White Racism* (2008) shows how language use and ideologies play an important role in circulating racial stereotypes in the "talk and text" of everyday life. For Hill, discourse denotes "all the varieties of language-in-use"—including what remains silent. She invokes the concept of ideology for the more politically loaded role of language that Foucault addresses in his theory of discourse. She argues that middle-class White discourse, which is widely circulated in the mainstream media as well as in ordinary talk, continues to produce White racism. She focuses on how slurs, gaffes, and covert racist discourse operate in the White public space.

Theories of practice have also been employed to interrogate the workings of race. In her 1991 *Stains on My Name, War in My Veins*, Brackette Williams's analysis of the deployment of racial and ethnic categories in the context of nation building draws on both Pierre Bourdieu and the cultural Marxist Antonio Gramsci. The complementarity of these two theorists is demonstrated in Williams's reworking of concepts such as Bourdieu's *doxa* (similar to the Gramscian common sense) and "transformist hegemony" from Gramsci, who elucidates how hegemony is reproduced by incorporating elements of subordinate groups' cultures into the national identity to secure their loyalty. Williams adapts these concepts for theorizing Guyanese nationalism and the cultural struggles between African and Indian descendants for cultural capital as well as political power.

Melissa Hargrove also finds Bourdieu's practice theory helpful, as she explains in her 2009 article in *Transforming Anthropology*, "Mapping the Social Field of Whiteness." To explicate White racism's operation within the social field of whiteness, she employs the concept of *habitus* (a system generating practices within a field where hierarchy is normalized). This allows her to explain how urban renewal, historic preservation, and heritage tourism work together to maintain racial inequalities and White domination. As a consequence, the African American Gullah/Geechee of Charleston, South Carolina, are disempowered, displaced, and silenced with respect to their historical consciousness and sense of preservation of values and priorities.

In his 2001 *Harlemworld*, John Jackson takes a performance approach to explain how race and class are seen through social practices. Drawing on a

wide array of theoretical sources (from Judith Butler to hip-hop and the less visible folk theory), his interpretation of performative raciality focuses on the residents of Harlem, New York. Contrary to conventional social theory, in which race is ascribed and class is achieved, Jackson argues that race is achieved through practices and performances marked by differences of class. However, performance alone is never enough. Race is not only what people do but also what is done to them in contexts of racism complicated by class exploitation, ethnicity, gender, and sexuality, which operate simultaneously.

In his 2005 *Real Black: Adventures in Racial Sincerity*, Jackson formulates a theory of racial authenticity and sincerity in which two models for assessing racial identities compete for explanatory dominance. Authenticity valorizes cultural scripts that restrict and objectify racial self-making, while sincerity affirms the subjectivities and uncertainties of racial performances.

In his more recent *Racial Paranoia: The Unintended Consequences of Political Correctness*, Jackson coins the concept of racial paranoia. This is a tool for theorizing the insidious power that political correctness and claims of color blindness have in silencing what Whites really feel, thereby sustaining the status quo. This causes intense distrust and anxiety within people who continue to be constrained by racial disparities.

Transnationalism, Globalization, and Development

The mapping of racializing processes in the interrelated contexts of transnationalism and globalization is an important new trend informed by a wide range of theoretical perspectives on development, postcoloniality, diasporas, neoliberalism, and the restructuring of nation-states. Synthesizing elements from a wide body of knowledge on race, nationalism, and hegemony, Linda Basch, Nina Glick-Schiller, and Cristina Szanton Blancs contribute a seminal analysis in their 1993 *Nations Unbound: Transnational Projects, Postcolonial Predicaments and Deterritorialized Nation-States*. In this text, they examine the racialization of new immigrants who resist hegemonic U.S. racial categories and the stigma invested in them. Their contestations, along with the processes of change engendering new racial alignments within U.S. society itself, are destabilizing the established racial order and the public discourse on racial classifications. In recent analyses of race's relationship with globalization, anthropologists elucidate how globalization intensifies race making and how the structural, ideological, and experiential workings of race contribute to the ways in which global transformations are configured. In some of this work, the political-economic restructuring and shifts in sociocultural production that occur within the global context are examined through the prism of concepts such as global apartheid and structural violence. The growing disparities along such lines of wealth, health, expectancy, and military power tend to correlate with race and implicate both local and supralocal modalities of racism. As Faye Harrison argues in *Resisting Racism and Xenophobia*, these are often sites of human rights struggles engendered by a broad continuum of violence. The transnational human rights regime has become a significant stage for remaking racial meanings and identities.

In her 2009 *Anthropology Today* article, "Invisible Colour: Landscapes of Whiteness and Racial Identity in International Development," Kristin Lóftsdottir addresses the overlap of race and global processes in her analysis of international development as a site where the meanings and representations of race, notably whiteness, are "stimulated and recreated." Through the lived practices, cross-cultural encounters, and visual representations of development, historical memories of colonial racialization are reinvested, and new racialized identities are constructed. This unintended process operates through a "developscape," a concept coined from Appadurai's mapping of various "scapes" across transnational terrain. According to Lóftsdottir, developscape refers to the mobility of people, commodities, and images as well as the ideas and desires appropriated within local contexts. These influence the ways development is imagined and performed—whether according to Western or Chinese scripts.

Neoliberalism

A number of anthropological studies of race and racism examine neoliberalism as a context for new racial meanings, frictions, and identities. In her 2011 *Racial Representations in Asia*, Yasuko Takezawa notes that new forms of racial exclusion have emerged, many of which are barely visible. In an era of racism without races, she seeks to understand invisible races and racisms. Her focus is on

the visible and invisible modes of representing racial differences and reproducing racialized disparities in the case of the Burakumin and the Koreans in Japan. Takezawa describes how nonvisual modes of representation are mediated through auditory, olfactory, or tactile sensorial responses, "triggered on the premise of the idea of race" and often based on dreadful or erotic feelings about imaginary differences. In her theory, she combines structural and phenomenological perspectives in explaining how multisensorial perceptions are represented through representational repertoires.

Neoliberalism's relationship with race is elucidated insightfully in Charles Hales's theory of neoliberal multiculturalism, which is presented in his 2006 book *Más que un Indio: Racial Ambivalence and the Paradox of Neoliberal Multiculturalism in Guatemala*. In this book, he demonstrates that neoliberalism is more than economic reform; it also involves the reorganization of governance in which the cultural rights of indigenous and Afrodescendant peoples are acknowledged but neutralized. Consequently, racial hierarchies are remade despite the endorsement of multicultural equality. A compensatory concept of collective rights has become central, contrasting with the enshrinement of competitive individualism in other national contexts. Latin America's neoliberal multicultural regimes "shape, delimit, and *produce* cultural differences," rather than suppressing them as in previous demands for assimilation in *mestizaje* discourse.

Beyond Binaries and Dichotomies

In the conventions of Americanist studies, the concept of race is presumed to be only applicable to African descendants, while ethnicity is relevant in the case of indigenous people. Peter Wade's *Race and Ethnicity in Latin America* argues against this dichotomous view, pointing out that race and ethnicity apply to both populations, which are differentially incorporated into racialized structures of alterity. Wade is joined by a growing number of anthropologists who substantiate the salience of race among Amerindians in Latin America. However, there is no consensus in this view. Addressing the issue from the United States in "Deracializing the Past," Joe Watkins advocates for deracialization, insisting that "'American Indian' is a politically created ethnicity rather than a racial one." Nonetheless, Hale argues for a "race-centered analysis" to address racial hierarchy and systemic racial privilege in ways that ethnicity theory has not. The challenge, he argues, is to theorize new cultural racisms in which racial hierarchy becomes more flexible and resilient.

In U.S. society, the hegemonic Black/White binary restricts how the complexities of race are understood. Jacalyn Harden's *Double Cross: Japanese Americans in Black and White Chicago* (2003), her analysis of Japanese Americans' relations with African Americans, demonstrates the necessity of "double crossing" the color line. Her metaphor connotes both betrayal to hegemonic racial assumptions and fluctuations across the line between "coloredness" and "leaving coloredness behind" for model minority status. She uses this idea to unbury the history of Japanese American and Black convergence in struggles related to work and civil rights. She thinks that the politics and economics of divide-and-conquer have kept the representations of the "rebellious, government-dependent" Blacks and the "model minority" Japanese antithetical.

Recent work on whiteness, the White public space, and White racial discourses has also challenged conventional approaches to race framed as a Black problem embedded in Black/White disparities. In addition to the scholars discussed earlier in this entry (not only Brodkin, Hargrove, and Hill but also Davis et al. and Shaw, in whose work Whites were included), there are two other scholars whose writings are notable. Pem Davidson Buck's Marxist-inflected account of rural central Kentucky's poor Whites in her 2001 *Worked to the Bone* explains the shift from earlier cross-racial alliances. John Hartigan's 1999 *Racial Situations: Class Predicaments of Whiteness in Detroit* offers insights into class- and place-specific forms of whiteness. His analysis, made especially clear in his 2010 *Race in the 21st Century: Ethnographic Approaches*, is informed by recent trends in conceptualizing cultural dynamics, which are integral to how racial difference, belonging, and identification are made and remade.

Radcliffe-Brown, A. R.

A. R. Radcliffe-Brown (1881–1955) is considered one of the founders of modern social anthropology and the main theorist of structural functionalism.

Biography and Works

Alfred Reginald Radcliffe-Brown (born Alfred Reginald Brown), the second son of Alfred Brown—a manufacturer's clerk—and his wife Hannah, née Radcliffe, grew up in Birmingham, England. After his father's death in 1886, the family struggled economically, but thanks to grants, Brown was educated at the prestigious King Edward's School and subsequently went on to study for a degree in mental and moral Science at Trinity College, Cambridge. Studying under the leading anthropologists W. H. R. Rivers and A. C. Haddon, Brown was drawn toward this subject, and in 1906, he left for fieldwork in the Andaman Islands.

Instructed by Rivers to trace genealogies and to collect a wide variety of materials with the explicit aim of reconstructing the original way of life of the "Negritos" of the islands—presumed to be the "lowest of the four population strata in Southeast Asia"—Brown found fieldwork taxing and difficult. From his published work, it transpires that he only spent about 10 months in the field out of the 2 years he spent in the archipelago. Most of this time seems to have been spent with people who had left their villages and moved to the town of Port Blair. Admitting poor mastery of the local language, Brown did most of his fieldwork in Hindustani and, in the final period, with an English-speaking interpreter.

Retrospectively, Brown's Andaman fieldwork is considered unfocused and unsatisfactory, and he returned without a full record of Andamanese genealogies, as well as no proper grasp of their original social organization. The contrast with the sophisticated fieldwork style developed a few years later by his contemporary and rival Bronisław Malinowski is striking.

Following his return from the Andaman Islands, Brown received a fellowship at Trinity College on presenting his dissertation. The Andaman material would not be fully published until 1922, however, and already in 1910, Radcliffe-Brown embarked on new fieldwork in Western Australia, accompanied by the zoologist Grant Watson and the self-taught ethnologist Daisy Bates. Arriving late in the field, probably because of his marriage to Winifred Marie Lyon in April 1910, Brown concentrated on the study of kinship systems. He had by now become thoroughly acquainted with the sociology of Émile Durkheim and his *Annales* school. Seeing the comparative, systemic Durkheimian approach to social life as superior to the ethnological tradition in which he was trained, Brown became determined to mold social anthropology into a kind of comparative micro-sociology, with an emphasis on scientific explanation of variations in structural form rather than the description and comparison of cultural traits.

Although his Andaman monograph remained unfinished, Brown would publish a series of

influential papers on Australian kinship systems and totemism in the 1910s. The quality and quantity of his own empirical material was always the Achilles' heel of his academic work, and at the meeting for the Association for the Advancement of Science in Melbourne, Australia, in 1914, Bates openly accused Brown of having plagiarized her work. As a matter of fact, his original contribution lay not so much in his ethnography, where he often relied extensively on secondary sources, as in his theoretical innovations. Brown nevertheless had a reputation for drawing freely, and often without citing the sources, from data collected by people whom he did not consider professionals.

Due to the outbreak of war in Europe, Brown found himself stranded in Australia in 1914. He taught at the Church of England Grammar School in Sydney for a while, before taking up the post of director of education in Tonga (1916–1919). In 1921, he became a professor of social anthropology at the University of Cape Town, South Africa, founding the School of African Life and Languages and directing research on various South African peoples.

In South Africa, Brown refined his theoretical program of modeling social anthropology on the natural sciences. Unlike Durkheim's French followers, he saw empirical work essentially as a means to develop general hypotheses about social form, ultimately leading to the formulation of "natural laws of society." In South Africa, he became involved, reluctantly, in political matters of race and ethnicity, which he saw as a "detestable nuisance," but he nevertheless gave policy advice to the White rulers and made a statement on the possibility of a future South African nationalism that encompassed both Blacks and Whites. In the same period, his *Andaman Islanders* (1922) was finally published. Although Brown was by then a full-fledged Durkheimian with his own theoretical agenda, the influence of Rivers's psychological and cultural anthropology was still perceptible; it is less so in the second, slightly revised edition of 1932.

Among Brown's students in Cape Town were Isaac Schapera, a later member of his Oxford group, and Winifred Hoernlé, who subsequently taught social anthropology for many years at the University of the Witwatersrand in Johannesburg. Brown's influence on South African anthropology was enduring.

In 1925, Brown returned to Australia, as a professor of social anthropology in Sydney; shortly afterward, he hyphenated his name into the now familiar form, reasoning that there are far too many Browns in the world. In Sydney, he developed an ambitious teaching program encompassing both theoretical and applied anthropology, while continuing to pursue his interests in Australian kinship systems and totemism. A successful fund-raiser, Radcliffe-Brown soon had a fair number of research students working in Australia and the Pacific, collecting data that Radcliffe-Brown would later mine for his comparative theorizing. Founding the influential journal *Oceania* in 1930, he soon afterward published *The Social Organization of Australian Tribes*, synthesizing material produced by his own students as well as drawing on many other sources with the explicit aim of classifying Australian kinship systems comparatively, showing both their differences and their similarities. Australian kinship is reputed to be exceedingly complex and diverse, with moiety systems, double descent, and sometimes systems creating four lines of descent. This book, as well as subsequent volumes published by Radcliffe-Brown and his students, helped establish the reputation of British and Commonwealth social anthropology as "kinshipology" by the late 1940s.

Radcliffe-Brown succeeded in establishing Sydney as an anthropological milieu of note, and many foreign visitors, from Margaret Mead to Malinowski's old student Raymond Firth, visited the department for varying lengths of time. He nevertheless ran into difficulties with the Australian Research Council over administrative and financial matters, and this may partly have motivated him to accept a position at the University of Chicago in 1931.

The years in the United States, from 1931 to 1937, interrupted only by a few months in Yanching (China) in 1935, differed from the time spent in South Africa and Australia. In the United States, Radcliffe-Brown arrived as an established theorist and the leader of a "school" (although he himself eschewed that term), amid a flourishing anthropological community where Boasian historical particularism dominated. Engaging with leading American anthropologists of the day, such as Robert Redfield and Ralph Linton, and teaching emerging anthropologists like Sol Tax and Fred Eggan, Radcliffe-Brown left his mark on the Chicago department, which for decades was reputed to be the most

"social anthropological" department in the country. His publications from this period tended to be programmatic and polemical; and his final series of lectures, titled *A Natural Science of Society*, emphasized the importance of studying social structure comparatively to arrive at "natural laws," a project very distinct from the psychological, linguistic, and sometimes historical interests of the Boasians.

Radcliffe-Brown's return to England to take up a chair at Oxford as professor of social anthropology was greeted by his admirers, foremost among whom were E. E. Evans-Pritchard and Meyer Fortes, and he soon succeeded in establishing the Institute of Social Anthropology, which was independent of the Pitt-Rivers Museum. Differences with Malinowski, still at the London School of Economics, became acutely pronounced as the two men found themselves in the same country, and Radcliffe-Brown castigated Malinowski and his followers for "muddled thinking" and an unscientific interest in culture (a hopeless abstraction, according to Radcliffe-Brown) and psychology. Malinowski subsequently left for the United States, where he died in 1942, but the tension between the Malinowskians and the followers of Radcliffe-Brown's structural functionalism continued into the postwar years.

With the publication of *African Political Systems* (edited by Fortes and Evans-Pritchard, 1940) and Evans-Pritchard's *The Nuer* (1940), the hegemony of Radcliffe-Brown's structural functionalism in British social anthropology was firmly established. Although Malinowski had never written systematically about politics or kinship, these central features of social structure were now defined as the very engine of social life. For a few years, Radcliffe-Brown, Fortes, Evans-Pritchard, and Max Gluckman were all at the institute at Oxford. However, Radcliffe-Brown spent much of the Second World War abroad—largely in Brazil—and by the time of his return, there were indications that his influence was already waning.

After having been retired against his will in 1946, Radcliffe-Brown continued to travel and teach, notably in Cairo and at Rhodes University in Grahamstown, South Africa. Two of his most notable books, the coedited (with Daryll Forde) *African Systems of Kinship and Marriage* (1950) and his main collection of essays, *Structure and Function in Primitive Society* (1952), were published in this late period. His Chicago lectures had been transcribed by Lloyd Warner's secretary and were published posthumously as *A Natural Science of Society* (1957), without making much of an impact on a discipline that had by then moved decisively in new directions.

Often described as egocentric and flamboyant, Radcliffe-Brown moved in the upper circles of society and doubtless contributed to social anthropology's reputation in Britain as an upper-middle-class discipline. He was nevertheless also described as a "charming host and a brilliant conversationalist" in an obituary by his American students Fred Eggan and Lloyd Warner. A complex man, Radcliffe-Brown was simultaneously perceived as an arrogant snob with aristocratic affectations and a Utopian adherent of radical political ideas. In this contrast between order and chaos lies, arguably, the key to his intellectual creativity and his original attempt to reveal structural regularities hidden by a superficial disorder.

Theoretical Contributions

Considering his influential and long career, Radcliffe-Brown was not a prolific writer. His main essays are collected in a relatively slim volume, *Structure and Function in Primitive Society* (1952), and he never wrote a proper monograph after *The Andaman Islanders*. However, his public lectures and articles were important. They would typically begin with a sweeping theoretical statement, sometimes with an acerbic polemic against muddled or antiquated thinking, followed by a statement of the problem in the form of a puzzle, and then delving into some empirical material, his own or (usually) that of others, to emerge with a solution to the problem. His essays are lucid, sophisticated, and stringent.

Since Radcliffe-Brown is frequently described as a bad field-worker and a good analytical thinker, it should be pointed out that his field experiences, however incomplete, played an important part in shaping his theoretical thought. In the Andaman Islands, he recognized the impossibility of reconstructing social structure through oral sources and instead focused on synchronic analysis. In his Australian work, a main source of motivation was to show that Durkheim's analysis of totemism was simplistic, and in South Africa, he was intrigued by seeming anomalies in the kinship systems of the "native peoples."

Radcliffe-Brown's main source of intellectual inspiration was Durkheim's sociology, although the

central analytical terms, structure and function, had been introduced in the 1870s by Herbert Spencer. In Durkheim, Radcliffe-Brown found a theoretical program enabling him to overthrow the directionless nitty-gritty detail of ethnological description (which he and his followers would often castigate the Malinowskians for) and the historical speculations of evolutionists and diffusionists. A society, according to Radcliffe-Brown, could be fully understood through an understanding of the interrelationships of its institutions in the present. There are perceptible traces of evolutionist problem formulations in Radcliffe-Brown's early work, but these were shaved off progressively as the structural-functionalist program took shape in the years following the First World War.

At its most general level, Radcliffe-Brown's main theoretical contribution consisted in his insistence in studying the interrelationships between social institutions and their mutual influence. Unlike Malinowski's functionalism, which argued the primacy of individual needs as the main explanation for the existence of particular social institutions, Radcliffe-Brown—like Durkheim—placed institutions before individuals. His critics might allege that this mode of explanation was teleological; it seemed as if social institutions had intentions and goals of their own. However, Radcliffe-Brown repeatedly emphasized that he looked at co-adaptation between institutions and never believed that they were governed by an invisible hand or that they were fitted perfectly together like the pieces of a jigsaw puzzle. His founding question was how it could be that stable social forms could emerge out of a situation of flux and instability. Characteristically, Radcliffe-Brown held that religion and ritual provide "the glue which holds society together," unlike Malinowski's view that the "function" of religion consists in satisfying individual needs for order, meaning, and so on.

Believing that the accumulation of empirical material and the refining of theoretical models would eventually lead to the formulation of a set of natural laws of society, Radcliffe-Brown did not see himself as a representative of a "school." A full-fledged science, he argued in 1940, has no need for schools, since the scientific endeavor is common to all who practice it.

While mainstream American anthropologists invoked culture as their key concept, Radcliffe-Brown saw culture at the same time as messy and abstract. Like a natural scientist, he wished to isolate variables that could be studied accurately, such as customary laws, marriage rules, structures of authority, and kinship terms. In one of his later statements, he wrote contemptuously about the idea of "culture contact," arguing that in an encounter involving, say, Europeans and Africans, research should focus on their social relations within a specific structural arrangement and not on relations between "cultures."

Although it is not his best work, "The Mother's Brother in South Africa" (1924) may still be Radcliffe-Brown's most well-known article. Its merit lies in its clear delineation of the difference between the old diffusionist anthropology and his own structural functionalism. Unlike previous writers, Radcliffe-Brown argues that the warm, affectionate relationship that exists between a male ego and his mother's brother in patrilineal societies is not a "survival" or "residue" from a previous matrilineal or even matriarchal society but can be understood through its contemporary functioning. Ego is to inherit from his father, who is a figure of authority. His mother, a member of another kin group, is nurturing and caring and cannot impose effective sanctions anyway. The sentiment toward the mother, according to Radcliffe-Brown, is extended toward her kin group, including the mother's brother, because he too is inoffensive, not being in a position to effectuate sanctions. The "joking relationship," studied by Radcliffe-Brown and several of his students, is a related kind of institution.

Radcliffe-Brown's writings on totemism also illuminate his theoretical significance, as well as indicating his intellectual development. In fact, he developed two theories of totemism, separated by 2 decades. Totemism, an institution whereby different segments of a society associate themselves with a natural species (often an animal), had already been discussed by many British anthropologists. Radcliffe-Brown's first theory, elaborated in "The Definition of Totemism" (1914), was unspectacular and largely echoed Durkheim's view that it served to enhance solidarity within society. Radcliffe-Brown's second theory, however, elaborated in his late article "The Comparative Method in Social Anthropology" (1952), developed the argument several steps further. While the first theory is not falsified, it is shown to be incomplete, and Radcliffe-Brown argues that the imagined relationship between the natural species

corresponds to the relationship between the totemic clans, creating a system of contrasts or oppositions, which create unity and order in the social and the natural world. Claude Lévi-Strauss would later build on this insight when developing his structuralist theory of totemism.

Criticism and Legacy

In Britain, Radcliffe-Brown's main opponents were the Malinowskians, who insisted on the precedence of the complexity of the social world above elegant models that, in their view, oversimplified in misleading ways. American cultural anthropologists were generally less engaged with structural functionalism and often more sympathetic, but its influence was similarly limited outside Chicago and was felt only in scattered pockets elsewhere. French anthropologists, following the lead of Marcel Mauss, took Durkheim's legacy in a direction different from that of Radcliffe-Brown, applying it to qualitative studies of particular institutions or societies. In England, a decisive break came when E. E. Evans-Pritchard, the new incumbent of the chair in Oxford, repudiated Radcliffe-Brown's positivist ambitions for a natural science of society, arguing instead that social anthropology should fashion itself on history.

Methodological individualism, pioneered by Raymond Firth and later developed by Fredrik Barth and F. G. Bailey, was a growing influence in Britain in the 1950s, and structuralism was already a major phenomenon in France. Network analysis, developed by John Barnes, Max Gluckman, and others, owed a debt to Radcliffe-Brown but did not take on his grand theoretical project. By 1955, it seemed as if Fortes in Cambridge was the only major social anthropologist who remained loyal to structural functionalism. Later, Mary Douglas would nevertheless demonstrate brilliantly how structural functionalism combined with structuralism could create a powerful new brew.

At the time of his death, at the age of 74, Radcliffe-Brown had already been in retirement for nearly a decade, and he had already witnessed the gradual decline of his influence in social anthropology. Yet his influence and legacy tend to be underestimated by contemporary anthropologists, who admire the quality of Malinowski's fieldwork and reject Radcliffe-Brown's theoretical ambitions. Today, his systemic, comparative approach to social life remains powerful, if indirect, especially in British, Commonwealth, and European social anthropology, where studies of complex societies, and network analysis in particular, are indebted to Radcliffe-Brown's somewhat overstated "natural science of society."

Radcliffe-Brown, often criticized for not being able to deal with social change, held a more dynamic view of society than his critics allege. The positivism in *Natural Science of Society* is complemented by an acute attention to inner tensions and frictions between the institutions that make up a society and a conscientious examination of ethnographic detail. Radcliffe-Brown's fundamental question, concerning the mechanisms that create stability out of a natural state of flux, remains crucial to contemporary anthropological theorizing.

Radin, Paul

Paul Radin (1893–1959) is normally accorded a relatively minor status in the Boasian pantheon of American anthropology. His name never became as well-known among the general public as that of a Margaret Mead or a Ruth Benedict, nor was he as central to the institutional and epistemic legacies of Boasianism as figures like Alfred Kroeber, Robert Lowie, and Edward Sapir. But his relative obscurity does not mean that he contributed less to anthropological social theory than his contemporaries—quite the contrary.

Radin was born in Poland, but his family emigrated to the United States when he was young. He earned a BA at City College in New York, and after some years of graduate study in Europe, he returned to New York to complete a PhD in anthropology under Franz Boas at Columbia University in 1911. After working for the Bureau of American Ethnology and the Geological Survey of Canada in the years before the First World War, he held several academic positions, the longest of which was at the University of California, Berkeley (1918–1920, 1930–1941, and 1944–1949). Radin seems to have been, by all accounts, a somewhat difficult and peripatetic figure, never staying long enough in one place to build a stable intellectual network of his own and never being agreeable enough to charm interlocutors to his way of thinking. Those who knew him, like Harry Hoijer and David Sapir, described Radin as fiercely yet productively iconoclastic, someone who disliked the institutional life of a professor. Eminent historians of anthropology such as George Stocking and Regna Darnell likewise classify Radin as a "rebellious Boasian" and as the "maverick among the first generation." Yet, however much he bristled, his contemporaries clearly respected him, with Lowie citing him as belonging to the Boasian "super-intelligentsia."

This entry does not allow space for an exhaustive account of Radin's contributions to ethnography and theory. Instead, it will describe key moments and lines of inquiry in Radin's work that seem especially salient contributions to the future of social theory. Indeed, in certain respects, the human sciences have only recently caught up with Radin's "maverick" thinking. This is certainly true of his pathbreaking work on non-Western intellectuals and on the dynamics of the constitution of anthropological knowledge. More directly than the other Boasians, Radin laid the groundwork for much of future reflexive anthropology. The entry also highlights Radin's early championing of methodological individualism in anthropological research and his unusual effort to import Jungian psychoanalysis into anthropological theory decades before Freudian psychoanalysis was to have its greatest impact on the field.

Radin's Anthropology of Intellectuals

Radin's *Primitive Man as Philosopher* (1927) is generally regarded as his most important and enduring legacy for its argument that indigenous peoples possessed philosophy, or more to Radin's point, *philosophers*, just as the settler colonizers did. The importance of the text extends considerably beyond the broader Boasian antievolutionist argument that all human beings possessed equivalent mental capabilities. Radin's book was also the first sustained effort in anthropology to discuss the effects of the social specialization of knowledge on practices in field research, analysis, and intercultural representation central to ethnographic methodology. As such, it foreshadowed all future reflexive anthropology.

In *Primitive Man as Philosopher*, Radin argues that although all societies possess intellectuals, ethnologists of "primitive" societies have failed to discern a division of mental and material orientations, assuming instead that all "primitives" are simply "men of action." The key to this failure lay, for Radin, in the stronger sensual and pragmatic orientation of primitive societies, which alienated Western intellectuals, including ethnologists, and thus drew attention away from "primitive" intellectual accomplishment. Since sensualism is the antithesis of the Western intellectual's own life, it transitively becomes the locus of distinction for what is defined as "primitive." Thus, according to Radin, ethnologists were oriented, unintentionally perhaps, toward neglecting the subtlety of ideation among their fellow thinkers in primitive societies in favor of the more overtly sensual or mechanistic cultural expressions of nonintellectual social actors.

One of the more interesting implications of this argument is that the ethnologist and the primitive philosopher actually have more in common, intellectually and sociologically, with one another than either might share with the "men of action" in their own societies. Radin understood that his argument undermined the idea that cultural orders existed that unified entire collectivities. On the one hand, he argued that the idea of a unified cultural order is fictitious insofar as it masks a continuous dialogical politics of cultural knowledge and representation between intellectual and nonintellectual individuals. On the other hand, where a sense of collectivity does emerge, Radin shows that it originates in the ethnological interpretation of native philosophical work. This is a hidden collaboration between two groups of "thinkers," the ethnologists and the native philosophers: Both groups of intellectuals share a common orientation toward objectifying cultural knowledge,

an orientation toward ordering, indeed collectivizing knowledge. In the process of anthropological (ethnological) analysis, though, that collaboration is suppressed, resulting in the proposition of general cosmologies rather than intellectual artifice and dialogue. According to Radin, where anthropological knowledge purports to represent collective cultural knowledge, it is only, in fact, partially representing the cultural labors of a particular social class. Radin was frustrated that this displacement from individual and intellectual to collective and cultural was nowhere recognized and accounted for among his contemporaries, a frustration that contributed strongly to his turn toward methodological individualism.

In many respects, *Primitive Man as Philosopher* thus pioneers what much later came to be termed the "reflexive turn" in anthropology. Radin pinpoints an enduring ethical dilemma for anthropological theory. If anthropological knowledge is driven by a collaborative engagement between specialized knowledge makers, then there is a constant danger of ignoring or marginalizing the understandings and lives of social actors with other epistemic dispositions. Here too, Radin's work gestures very clearly toward the theoretical and ethical considerations that have come to orient contemporary reflexive anthropology of experts and cultures of expertise, where theorem and datum often become compressed and where epistemic authorities overlap and compete in often uncomfortable ways.

Radin and the Boasians

The misidentification of the primitive with sensuousness and ideology with collectivity were not the only failings that Radin saw in contemporary anthropology: Radin's relationship to his teacher, Boas, and to his Boasian colleagues was decidedly troubled. Indeed, his major statement on the discipline—*Method and Theory in Ethnology* (1933)—is filled with, by turns, aggressively polemical and slyly familiar distancing of his own position from the then Boasian mainstream of American anthropology. Taken as a whole, the work best captures Radin's argument against all sweeping, ahistorical, or evolutionary generalization in anthropology. Against the study of mankind, it champions an anthropology and an ethnographic practice whose ends are the robust understanding and representation of cultures and individuals in their historical specificity, not subordinate to any theoretical or "sociological" projects. Despite his recognition of their good-faith efforts, Radin saw his Boasian contemporaries as more or less unconsciously wedded to a fundamental misunderstanding of both the nature and the limits of the anthropological project.

Radin argued that the primary culprit in perpetuating these misunderstandings was Boas himself. While his critique is far-ranging, it centers on the anthropologist's handling of and relationship to his or her data. He understood Boas as approaching ethnography, despite himself, as a physicist. Physical facts speak for themselves; cultural facts do not: The unannotated presentation of "raw" data about material culture, typical of work such as Boas's Kwakiutl monographs, could not be, for Radin, the end goal of anthropological practice. Similarly, Radin found fault with the recording of complex myths and ritual practices solely in English, as well as their distillation into putatively essential elements for cross-cultural comparison. At the heart of it, what Radin saw in these tendencies was the setting apart of the ethnographer from the data. In *Method and Theory*, Radin presciently wrote that

> we are part of the cultural facts we are describing in a very real way . . . the moment we stand beside or above them, we do them injury; we transvaluate them and make them facts of a different order. (1933, p. 11)

Beyond the fascination with the natural sciences, Radin pointed to a number of sociological explanations for these tendencies, such as the necessarily unsophisticated character of early anthropological research, the professions from which the first anthropologists were recruited, and the widespread societal and academic taste for "antiquarianism." However, he didn't see the problems of contemporary method as irremediable. As a palliative measure, he urged anthropologists to take inspiration from culture historians, arguing that anthropologists should use the available historical materials not to causally explain but only to enrich the description of the cultural phenomena under discussion.

For Radin, the key locus of information about the contemporary history of aboriginal peoples can only be the individual aborigine. He argued that ethnographers should not treat their informants as

tokens of a cultural type but as culturally shaped individuals acting in particular historical contexts. He disapproved of attempts by Boasians such as Mead and Kroeber to integrate the individual and society, arguing that their projects relied on psychological catchwords such as "the unconscious" to stand in for the individual. Sapir, for his part, was criticized for using a generic "man" despite recognizing the importance of the individual as such. To ameliorate this lack of attention to the actuality of ethnographies' dramatis personae, Radin made a profoundly humanist methodological turn toward biography, arguing for a near-total *epistemological* privileging of the individual over his or her culture.

Methodological Individualism and the Turn to Biography

Radin's commitment to methodological individualism was far from abstract. Radin held the study of actual individuals and specific events to be *the* essential components of solid ethnographic reasoning. If there are no generic individuals expressive of their cultural types, then only a comprehensive investigation of particular cases can yield fruitful ethnographic data. Moreover, the meaning of these singular events and persons for the ethnographer cannot be found in an external description of them. For Radin, the truly objective description of social facts must include the subjective attitudes of their participants. For this reason, Radin increasingly turned to autobiography as a privileged source of ethnographic data. His *Crashing Thunder: The Autobiography of an American Indian* (1926) opens with an explicit challenge to take seriously the inconsistency and vagueness characteristic of real lives, to move beyond grand systematizations to the focused investigation of actual persons.

Radin's interrogation of the relationship between the individual and society culminated in his final book-length work, *The Trickster* (1956), which contains some of his most trenchant thought about what it means to be human. The main part of the book is taken up by a telling of the Winnebago Trickster Cycle; Radin's analysis and appendices by Károly Kerényi and C. G. Jung make up the latter half. Although he was clearly influenced by his long-standing relationship with Jung, Radin was far from content to simply ape a Jungian analysis of his American Indian material. In treating these stories, Radin tacks between a psychoanalytically inflected analysis of the symbolic economy of the Trickster myth in general and a sophisticated pragmatics of the specific speech scenarios in which it was actually told. The result is a mélange of anthropology and psychoanalysis strikingly different from the more Freudian-influenced thought of the other Boasians of his generation.

In *The Trickster*, Radin does not attempt to treat individuals as tokens of a mental-cultural whole or conduct a psychoanalysis of the hypostasized culture itself. Instead, under the influence of pragmatism no less than Jung's, his aim is an understanding of the concrete speech acts of the "raconteurs" of these stories. He is quite attentive to the actual context of the production and transmission of these myths, to the attempt to inculcate structures of thought and conduct in listeners, as well as to the aesthetic features of the stories themselves. Radin is interested in the meanings of symbols for specific individuals in specific speech situations. In *The Trickster*, he is committed both to an understanding of the highly elaborated perspectives of expert storytellers and to the impact of this elite discourse on the psychosocial world of everyday Winnebago. Walking the line between a philosophical anthropology and a careful culture history, his attempt to think at once of the historical, the psychological, and the interpersonal continues to demand serious attention today.

Conclusion

Clearly, much of Radin's thought bears the marks of his era and conflicts with current disciplinary *doxa*. However, it is easy to see in his work the roots of several lively currents within contemporary anthropology. Although developed through the treatment of ritual specialists and philosophers, his attention to the dynamics of differential competence and epistemological authority in small-scale societies marks him as the first anthropologist of expertise and secures a place for him in the early sociology of knowledge. His commitment to conducting ethnography as a cultural history of the present marks him as a key pivot point between the culture diffusion studies of his Boasian colleagues and the more nuanced causal understandings of later historical anthropologists. His focus on the subjective meanings of events for their participants and the imbrication of the ethnographer with his or her data is

a clear and quite early precursor to the later turn toward interpretive ethnography. Despite his place within these intellectual traditions, however, what is perhaps most striking about Radin's thought is its iconoclasm, and what is perhaps most rewarding in returning to him as a thinker is that arguments such as those of *The Trickster* remain as unexpected and original today as they were when they were first advanced.

Rappaport, Roy

Roy Abraham Rappaport (1926–1997), an American anthropologist, is recognized as a key figure in ecological anthropology and the study of religious ritual in human evolution.

Biography and Major Works

Roy Abraham "Skip" Rappaport was born in New York City. Like many others, Rappaport's path to the field of anthropology was not direct. He enlisted in the U.S. army at the age of 17, served with the infantry during World War II, and was awarded a Purple Heart after being nearly killed by the German troops. After returning from the war, Rappaport attended Cornell University, where he completed a BS degree in hotel administration in 1949. Two years later, he opened a country inn, which he named "Avaloch," in the Berkshire Hills of Massachusetts. Although he would continue to be known for his hospitality and the great pleasure he took in entertaining, by the late 1950s, Rappaport became increasingly discontented with his life as a businessman. While reading the social psychologist Eric Fromm's *Escape From Freedom*, which describes the conditions under which an unconscious search for unity with others can lead people to support fascist ideas, Rappaport decided that the inn could not fulfill his growing desire to confront a range of contemporary problems.

Rappaport's cousin Robert Levy, then a psychoanalytic psychiatrist, who later became an anthropologist at the University of California, San Diego, introduced him to the Pacific Island ethnologist and historian Douglas Oliver as well as Kai Erickson, who would later become a sociologist at Yale. On their advice, Rappaport read the American anthropologist Ralph Linton's symposia volume *The Science of Man in the World Crisis*, in which Linton commented on the war and lamented what he saw as an increasing fragmentation in scientific inquiry—a drift that Rappaport attempted to contend with in his own work through a focus on unifying themes. It was after a conversation at Columbia University with Conrad Arensberg, now a recognized leader in the anthropological study of complex modern societies, that Rappaport decided, in 1958, to pursue his doctorate in anthropology. He earned his degree at Columbia in 1966 after working with other personalities in the discipline such as Morton Fried, Marvin Harris, Margaret Mead, and Eric Wolf. His first anthropology course was an introduction with Fried beginning in January 1959, during which he met his future wife, Ann, who would later join his fieldwork and assist in linguistic analysis. He sold his inn in March that year.

As a student in 1960, Rappaport conducted his first empirical research in the Society Islands with Kenneth Emory, an ethnologist at Hawaii's Bishop Museum, and Roger Green, a Harvard archaeologist. Although Rappaport was not satisfied with

archaeological fieldwork, the experience allowed him to begin conceptualizing a framework for analyzing a human population, social and cultural structures, and the biophysical environment in a single study—an essential start to his own fieldwork 2 years later. While on the long boat trip in the South Pacific, Rappaport read Marshall Sahlins's *Social Stratification in Polynesia*, which became a source of his interest in ecological science. His emerging human-ecological approach was later honed through the close mentorship of the anthropologist Andrew Vayda, who encouraged Rappaport to conduct research in the highlands of Papua New Guinea, where Vayda himself had an ongoing project. Rappaport ultimately made two trips to the region. His dissertation fieldwork was conducted from October 1962 to December 1963. A follow-up study under a grant from the National Science Foundation from October 1981 to August 1982 allowed him to study the acculturation of the relatively isolated Tsembaga Maring as contact with contemporary Papua New Guinean society increased.

Approximately 1 year after his return from his first major fieldwork, Rappaport presented an academic paper at the 1964 meeting of the American Anthropological Association. This introduced career-defining themes such as the place of religion and ritual in ordering human societies and structuring their relationship with the natural world and the role of ritual in human evolution. These ideas were greatly elaborated in Rappaport's highly influential book that helped define the field of ecological anthropology. First published in 1968, *Pigs for the Ancestors* became a milestone anthropological work of empirical methodology that employed systems theory to demonstrate the function of ritual in the management of resources. After his last trip, Rappaport released a second edition in 1984, which sought to respond to critics through extensive comments that nearly doubled the first edition's size. Considering the criticism received in the 15 years since its publication, Rappaport bemoaned in his preface how scholars seemed compelled to adopt new approaches without having assimilated the lessons from previous approaches. In keeping with this sentiment, he informed students at the University of Michigan, where Rappaport served as chair of the Department of Anthropology (1975–1980) and taught from 1965 until shortly before his death in 1997, that they had a vital role to play as "synthesizers." Seven essays, the product of his analysis of ritual through commingled materialist and symbolic perspectives, appear in his book *Ecology, Meaning, and Religion*, published in 1979.

For Rappaport's final book, he set a goal of sweeping synthesis. He felt that trends leading to more specialized subfields had dictated severe limitations on the scope of anthropological analysis, reducing it to the study of discrete bits of human experience. It was Rappaport's penchant, however, to tackle the whole of the human condition. Published posthumously in 1999, *Ritual and Religion in the Making of Humanity* summarizes the evolution of Rappaport's thinking on broad themes that were his intellectual preoccupation for some 30 years.

In addition to his contributions to teaching and scholarship, Rappaport served as a consultant on a range of educational and environmental projects, including the National Academy of Sciences Task Force, which counseled the president of the United States on oil leasing on the outer continental shelf. He also advised the State of Nevada concerning the proposed use of the Yucca Mountain as storage facility for nuclear waste. Among numerous academic honors, Rappaport was elected to both the American Association for the Advancement of Science and the American Academy of Arts and Sciences. He served as president of the American Anthropological Association from 1987 to 1989, directing the organization toward greater engagement in policy issues.

Critical Contributions to Anthropology

Rappaport is widely recognized as a principal figure in ecological anthropology. Less widely acknowledged are his contributions to the anthropology of religion and the development of a publicly active or "engaged" anthropology.

Ecological Anthropology

Rappaport's *Pigs for the Ancestors* is based on fieldwork conducted in a community of some 200 individuals within the Simbai River valley of Papua New Guinea's Western Highlands. Rappaport considered the Tsembaga Maring a population in the ecological sense, given that he took them to be one component in a larger system of energy exchanges taking place within a bounded geographic area. The

Tsembaga were swidden horticulturalists for whom pig husbandry was an essential component of their agricultural and ritual cycles. In a highly egalitarian society, without hereditary or elected chiefs or big men, Rappaport identified in their ritual cycles a means for the Maring to maintain certain biotic communities within their territory, redistributing land, people, and local pig surpluses while limiting the overall frequency of intergroup conflict.

Rappaport's early writings focus on what he asserts are the ways in which Tsembaga religious rituals have regulated social and ecological interactions—mediating the interactions of a population with processes or things external to itself. He wanted to show the function of different cultural forms, their relative adaptive value, in maintaining existing relationships with a particular environment. While he recognized that the introduction of steel tools and crops such as maize through the networks of exchange together with efforts by the government of Papua New Guinea to suppress regional warfare had produced important changes, he insisted that any meaningful impact was limited. Rappaport's emphasis on equilibrium and stability, his dismissal of the possible consequences of individual power and political economy, as well as his assumption that the Maring community functioned ecologically as a nearly closed system have been widely criticized.

Anthropology of Religion

Rappaport's earliest attempts to understand the complex interrelationships of the ritual cycle and its roles in Maring society developed into an interest in religious ritual for its own sake, but only after he returned from his first trip to Papua New Guinea in 1963. Rappaport's focus grew from an interest in how self-regulation might work in the link between a given human population and its environment to a broad interest in the construction of meaning. While making no sharp separation between the realm of the sacred and everyday life, Rappaport finds in ritual the means through which religion is made.

In his emphasis on understanding the human condition, Rappaport sought to come to what he spoke of as some kind of rightness for humanity. He was fond of saying that he was not interested in abstract conceptions of culture, for example, but in arriving at theoretical and methodological tools that would enable people to do good for the world. For Rappaport, it came down to what is good for people to think and the consequences of seeing something in accordance with a particular worldview. Rappaport's interest was based on his desire to reconcile the apparent incompatibilities between religious understandings, what he called a pseudo-religion like economics, and the laws that govern the ecological systems known by science to make up our world.

Engaged Anthropology

In later work, teaching, and public lecturing, Rappaport cited the British philosopher Stephen Toulmin's critique of modern science and philosophy for dwelling too comfortably in the immaterial and the theoretical while ignoring tough practical issues. In contrast, Rappaport was committed to an engaged anthropology, which he saw as uniquely qualified to identify and attempt to solve complex contemporary problems. He felt that certain "disorders" threaten the survival of all species. He described these as violations of contingency relationships wherein a way of knowing such as economics usurps the dominant position of ecological principles to which it should be subordinate. Rappaport was confident that his understanding of systemic disorder gave him a principled ground for fostering a holistic anthropology tasked with shaping critical public policy. Rappaport often said that humanity is a species living in terms of meaning in a world subject to law. Rappaport believed that it was our responsibility as humans not merely to think of the world but also to think on behalf of the world. As such, he insisted that anthropology must deal with both human meaning and the laws of the natural world to be worthy of its subject, that is, worthy of humanity itself.

Rappaport's Legacy

Toward the end of his life, Rappaport used to joke that after a few years of fame in the early 1970s, following the publication of *Pigs for the Ancestors*, people simply stopped reading his work. He bemoaned that the impact of this landmark book may have blinded many to his subsequent contributions. His final book, *Ritual and Religion*, may reestablish Rappaport as a lasting voice in anthropological thought more broadly. Ellen Messer and Michael Lambek's edited volume of his chapters,

Ecology and the Sacred: Engaging the Anthropology of Roy A. Rappaport, as well as a special issue of the journal *American Anthropologist*, guest edited by Aletta Biersack, suggest the breadth and depth of Rappaport's ongoing influence. Rappaport's ideal of creating a holistic, engaged anthropology, both scientific and humanistic, and committed to understanding and solving the problems that continue to challenge humanity, may be more important than ever in an increasingly frictional world.

Rational Choice Theory

Rational choice theory is an umbrella term for a variety of models explaining social phenomena as outcomes of individual action that can in some way be construed as rational. "Rational behavior" is behavior that is suitable for the realization of specific goals, given the limitations imposed by the situation. The key elements of all rational choice explanations are individual preferences, beliefs, and constraints. *Preferences* denote the positive or negative evaluations individuals attach to the possible outcomes of their actions. Preferences can have many roots, ranging from culturally transmitted tastes for food or other items to personal habits and commitments. *Beliefs* refer to perceived cause-effect relations, including the perceived likelihood with which an individual's actions will result in different possible outcomes. For example, a village head may believe that raiding a neighboring village A has a higher probability of success than raiding a neighboring village B. *Constraints* define the limits to the set of feasible actions (e.g., the amount of credit one can get imposes a budget constraint on those considering buying a house).

Key Assumptions

Key ideas of the theory can be traced back to the writings of moral philosophers such as Adam Smith. The theory's core was subsequently developed by what is now referred to as neoclassical economics. Three assumptions are important: (1) individuals have selfish preferences, (2) they maximize their own utility, and (3) they act independently based on full information. These assumptions have also met increasing criticism from within economics, resulting in adjustments and the birth of "behavioral economics." This branch uses insights from psychology and the cognitive neurosciences to refine the oversimplified and highly stylized conceptualization of *Homo economicus*. Rather than dismissing deviations from the model as cognitive anomalies that would cancel each other out when aggregated to the collective level, behavioral economics and related fields attempt to develop a more realistic behavioral microfoundation.

There are many different variants of rational choice theory. Depending on the degree to which they adhere to the assumptions of the neoclassical model, rational choice explanations come in "thin," strictly neoclassical, versus "thick," sociological versions, in which these strict assumptions are relaxed. They differ on three dimensions: (1) the type of rationality, (2) preference, and (3) individualism assumptions.

Rationality

"Thin" versions of rational choice theory (neoclassical economics) assume *full rationality*: Individuals are fully informed about all their decision alternatives, the probabilities of their outcomes, and their consequences, and there are no cognitive limitations in the perception or processing of this information. Individuals base their decisions on cost-benefit

calculations and choose the alternative that generates the highest expected utility. Models of *bounded rationality*, for example, those proposed in 1957 by Herbert Simon, relax these assumptions: Selective attention limits the amount and kind of information, and limited information-processing capabilities lead to satisficing rather than maximizing: Individuals tend to accept solutions that are "good enough." More recently, Siegwart Lindenberg has proposed "thick" models of *social rationality* that specify under which conditions gain-maximization and other rationality traits contained in full- or bounded-rationality approaches will guide human decision making, and under which conditions other processes, such as learning or automatic responses, will guide behavior.

Preferences

In the "thin" version of the rational choice approach, preferences are exogenously given and stable, and individuals are *selfish egoists* striving toward the maximization of material gain. Selfishness can take the form of opportunism (self-seeking with guile), in which individuals break the rules to realize their objectives. "Thicker" variants of the theory assume that individual behavior may be motivated by *social preferences*; that is, they have a concern for the well-being of others. The benefits individuals strive for are not restricted to material gains but can be psychological or social (like prestige or behavioral confirmation).

Individualism

All rational choice explanations are reductionist: They share the assumption that explanations of societal-level outcomes (e.g., institutions, group structures, collective action, warfare, etc.) need to be grounded in a microlevel behavioral theory of individual action. This analytical strategy is also called "individualism." In the "thin version" (*methodological individualism*), social structures are not relevant as constraints on behavior (since all the necessary information is contained either in the objective prices of goods or in the subjective meanings). "Thick" versions (*structural individualism*) consider social and institutional embeddedness as major conditions affecting individual decisions and behavior. As a result, structural individualism models social phenomena through a three-step social mechanism explanation: (1) a macro-micro step, or "situational mechanism"; (2) a micro-micro step, or "action generating mechanism"; and (3) a micro-macro step or "transformation mechanism."

Rational Choice Theory in Anthropology

Along with structural-institutional theory, on the one hand, and cultural theories, on the other, the rational choice approach constitutes one of the three major metatheoretical paradigms in the social sciences. Though originally developed in economics, rational choice reasoning is now applied in other subdisciplines of the social sciences, though applications in the field of social and cultural anthropology are still rare. Here, economic anthropologists hotly contested rational choice arguments during the "formalism vs. substantivism" debate in the 1960s and 1970s. Currently, rational choice reasoning in anthropology seems to be largely restricted to the domains of economic, ecological, and evolutionary anthropology. For example, James Acheson uses rational choice theory to explain the differences between the Maine lobster industry and the New England ground fishery in their ability to solve collective-action dilemmas resulting in overexploitation. The volume *Kinship, Networks, and Exchange*, edited by Thomas Schweitzer and Douglas R. White, contains several contributions drawing on rational choice theory to explain, for example, the emergence of social and economic structure in the Highlands of Papua New Guinea or the pattern of cattle exchange among the Pokot in Kenya.

Redfield, Robert

The American anthropologist and sociologist Robert Redfield (1897–1958) was a leading theorist of social development and change who exercised a wide-ranging influence among American social scientists from the 1930s through the early 1960s.

Biography and Major Works

Robert Redfield was born in 1897 in Chicago, Illinois. His mother was the daughter of the Danish consul in Chicago, and his father was a prominent attorney. Redfield grew up in comparatively affluent surroundings. His early education was conducted by private tutors, and from the age of 13 through high school, he attended the University of Chicago Laboratory School. On graduating from the Lab School in 1915, he matriculated in the College at the University of Chicago. He struggled to establish direction in his first years in college, but after some interruptions, including driving an ambulance in France in 1917 for the American Field Service, he graduated from the College in 1920. At his father's strong encouragement, he earned a JD from the University of Chicago law school in 1921. On graduating, he took to practicing law in downtown Chicago, but after 2 years, he found law highly unsatisfactory.

While at the University of Chicago, Redfield married a fellow student, Margaret (Greta) Park, whose father, Robert E. Park, was a prominent member in the University of Chicago's sociology department. Redfield's father had died while Redfield was in his last year of law school, and Robert Park came to fill the role of a father figure. Park perceived Redfield's dissatisfaction with his law career and exerted a valuable influence in helping Redfield see opportunities beyond law. In one particularly important act, Park provided Greta and Redfield the funds to take an extended trip through postrevolutionary Mexico in 1923. Park believed that exposure to a society in the grip of active social reconstruction could be a mind-expanding experience and could possibly serve as a springboard for Redfield to reorient his life. The trip proved to be just that, and on returning home, at Park's encouragement, Redfield chose to leave behind the practice of law and undertake graduate study in social science.

In the fall of 1924, Redfield enrolled in the doctoral program in sociology and anthropology at the University of Chicago. His trip to Mexico had kindled an interest in the processes of social change, and this interest came to dominate his work over his entire career. Redfield conducted his dissertation research in Mexico, undertaking a study of social change in the small village of Tepoztlán. Two primary influences shaped Redfield's thinking regarding the dynamics of social change: (1) the culture-civilization debate of the 1920s, a searching dialogue among transatlantic writers and intellectuals following World War I, probing the issue of whether the transition from a supposedly less developed "culture" to "civilization" represented actual progress, and (2) Robert E. Park, who was his closest intellectual mentor and served as a personal conduit for the fundamental ideas of the "Chicago school" of sociology, which focused in large part on the empirical study of social dynamics within the urban setting. On completion of his dissertation study of Tepoztlán in 1928, Redfield graduated with a PhD degree and accepted an offer from Chicago to become an assistant professor in the department of sociology and anthropology.

Shortly after being hired at Chicago, Redfield published a slightly modified version of his dissertation, as *Tepoztlán, A Mexican Village: A Study of Folk Life* (1930). Redfield followed his study of Tepoztlán with a much broader set of interrelated community studies on the Yucatán peninsula, which focused on comparative studies of a village, town, and city. Like his earlier work, his goal in the Yucatán studies was to use empirical research to further develop the theory describing the processes of social change. Redfield conducted his studies in Yucatán over the course of the 1930s and published the culmination of his work in 1941, *The Folk Culture of Yucatán*.

Over the course of the 1940s, Redfield turned away from active field research and shifted his focus toward academic administration and several high-profile social and political concerns. In particular, he served as an expert witness in the Supreme Court case *Sweatt v. Painter*, challenging racial discrimination in college admissions, and he worked on the political effort to draft a world constitution. Following World War II, moreover, he turned his attention toward the broader, more philosophical aspects of social science. He wrote several articles exploring these issues, the most important of which was "The Art of Social Science," published in 1948 in the *American Journal of Sociology*.

In the 1950s, Redfield returned to active academic research and writing. He brought an expanded perspective to his work, focusing on comparative study of civilizations rather than on the narrower community studies that had characterized his earlier projects. Redfield embraced a decidedly interdisciplinary approach to comparative civilization studies, and he spent much of his effort in this initiative, demonstrating how anthropology could complement the work of other scholars in the characterization of civilizations. During the early to mid-1950s, Redfield published several short works directed toward the study of civilizations. He also collaborated with the University of Chicago philosophy professor Milton Singer to establish an interdisciplinary institute at Chicago for comparative study of civilizations.

Redfield was diagnosed with lymphatic leukemia in 1955. He continued to work over the next few years, but his scholarship slowed considerably. He died on October 16, 1958, in Chicago.

Critical Contributions to Anthropology

A single overarching theme runs through all of Redfield's anthropological work: the study of social change. His work can be seen as falling into three related but distinct subcategories: (1) modernization, (2) peasants, and (3) comparative civilization studies.

Modernization

Redfield's interest in what came to be called modernization studies emerged in his earliest work. Redfield brought a decidedly unique theoretical and methodological approach to his fieldwork in Mexico. Almost all the field studies conducted in the 2 decades prior to his undertaking his dissertation study had followed the methods defined by Franz Boas, the leading anthropologist in America from 1900 through the early 1920s. The basic goal of these studies was to capture a description of the life of tradition-bound peoples in remote, isolated villages prior to the transformation of their way of life by modern society. These studies were often called "ethnographic photographs," or more derisively by some, "salvage anthropology." Redfield viewed these static studies as wasted opportunities. Instead of trying to capture the way of life in a remote village before it changed, he argued, anthropologists should view villages just starting to change under pressures from outside influences as sociological laboratories. They should be studied precisely because they offered a chance to view social change "as it happens" and in a setting in which incipient changes could be more easily discerned and analyzed than in more complex societies. Villages on the periphery of developing society provided in his view the perfect setting to apply the scientific study of social dynamics with the goal of elucidating general principles of social change.

While Redfield fell somewhat short in drawing the theoretical generalizations about social change he hoped to reach from his Tepoztlán study, he achieved much more in his lengthier studies based on his work in Yucatán. Specifically, Redfield demonstrated the power of using sociological theory to extend the scope and reach of empirical field studies. Drawing heavily on the ideas of Robert Park and the "Chicago school" of sociology, Redfield proposed an ideal-type schema, which he called the "folk-urban continuum," to describe the general process of change from tradition to modernity that he observed in communities in Yucatán. His use of the folk-urban construct not only grounded his own research and provided a base for observations and generalizations but also served as a framework for multiple restudies of Latin American communities by the generation of anthropologists following Redfield. While many of these subsequent studies supported Redfield's conclusion, most of them challenged and sought to overturn his interpretations and conclusions, faulting him particularly for overlooking the role of politics and power in social dynamics. Redfield's work set the terms of debate, nevertheless, for many of the most significant community studies done in Latin America during the

1960s and 1970s and strongly influenced the turn toward the study of social evolution by anthropologists during this period.

Peasant Studies

Redfield's thinking about peasants stemmed directly from his modernization studies. Almost all his ethnographic field studies focused on what he referred to as "intermediate peoples," or peasants, who occupied a distinct sociocultural and economic space between traditional remote villages and urban civilization. Redfield's initial treatments of peasants emphasized the cultural aspects of their experience. Yet in his later work, his focus shifted more toward political and economic dimensions. He argued persuasively, especially in his *Peasant Society and Culture: An Anthropological Approach to Civilization* (1956), that peasants constituted an appropriate subject of study for anthropologists, who up to the 1950s had concerned themselves almost exclusively with nonliterate, isolated, "primitive" peoples. Redfield's *Peasant Society and Culture* was one of the first texts to explore both the justification and the methodology for anthropological study of peasantry, and it became a foundational text for peasant studies, which emerged as an important subfield within anthropology in the second half of the 20th century. It should be noted that peasant studies developed in the 1960s and 1970s, largely in critique of Redfield's conceptual approach, emphasizing primarily material, economic, and political themes that had been underplayed by Redfield.

Comparative Study of Civilizations

Closely related to Redfield's work on peasants are his writings on comparative civilization studies. His primary contributions to civilization studies are his work on worldview studies, methodological discussions regarding community studies, and development of his Great and Little Traditions construct. He was one of the pioneers of worldview studies, which attracted numerous practitioners in the 1950s–1960s. He offered a compelling example of a worldview study in the internal view of a Yucatecan villager he provided in a chapter in *The Folk Culture of Yucatán* and then provided an in-depth methodological discussion of the practice of worldview studies in *The Primitive World and Its Transformations* (1953).

Redfield's Great and Little Traditions construct constituted his most important contribution to civilization studies. He proposed that civilizations be seen as composed of two distinct but intertwined cultural traditions: (1) the "Great Tradition" of the literary elite and (2) the "Little Traditions" of the nonliterate masses. These dual traditions exerted mutual influence in defining major civilizations. But the same mode of study or disciplinary approach could not be used to study both traditions. Redfield thus proposed a scholarly division of labor in which anthropologists focused on characterization of little traditions and humanistic scholars focused on great traditions. Scholars from several different disciplines found the Great and Little Traditions construct useful as a conceptual tool for describing the flow of ideas and influences within civilizations, and Redfield was widely regarded as one of the leading influences in the comparative civilizations discourses of the 1950s and 1960s.

Redfield's Legacy

Redfield's primary influence lay in the realm of theory making. His ideas and models describing the processes of social change provided a vocabulary that proved useful to mid-20th-century social scientists. His contributions to the modernization discourse of the 1940s–1970s are particularly important as he provides an example of an American social scientist who carefully sought to separate the concept of modernization from Americanization. He also served as an influential disciplinary philosopher who stimulated much discussion among his colleagues through his articles on the joint roles of science and art inherent in the practice of sociology and anthropology. Finally, Redfield provides an example still valid today of an engaged social scientist who demonstrated unshakeable faith in the value of social science to facilitate construction of a moral society.

Religion

The history of the theory of the anthropology of religion follows, to a degree, the general history of anthropology. Varying between amicability and terse rebuttal, the particular and the universal, anthropological approaches to religion seek to understand social constructs wherein actions, narratives, and texts coalesce around the whole of the social experience. Saturated with meaning, constituent ritual and myth are a part of the dynamic, interwoven, interactive fiber of cultural experience. At present, some anthropologists focus primarily on practice, others on meaning, others on the sociohistorical context, still others on the political ecology, some on cognitive science, and some on a combination of these models.

Of the many things that could be said about the anthropological study of religion, three things are clear: (1) that there is little interest in developing a model dedicated to determining epistemological truth; (2) that the human propensity to construct myths, rites, purity codes, and associations between material and ideology is widespread, perhaps universal; and (3) that apart from introductory texts to anthropology, there is little agreement about what the term *religion* means or how best to use it.

The term *religion*, as a taxonomy, creates and reflects a particular worldview. Defining religion is as difficult as defining culture. According to some, the term betrays at the very best a generalization of culturally specific phenomena or at worst an intellectual air that continues the colonial past.

A construct of the West, the term *religion* has been used as a pejorative as well as an expression of power. Rooted in Latin, some uses point to *relegare*, "to read again" (*re*: "repeat," *legere*: "to read"); others to *religio*, as "to *rely*" ("to depend on"); and some others to *ligation* (contractual obligations), for that which ties, restrains, or binds the gods and human relationships. To be *religio* involved the praxis of reading and tracing the narratives and ritual practices of one's ancestors or the different practices and worldviews of various peoples (*ethne*). The introduction of Christianity introduced a delineation between *nostra religio* and *vestra religio* (a collective's *religio* vis-à-vis the *religio* of others). By the 3rd century CE, the distinction was more pronounced, delineating true religion from false religion (*vera religio* from *falsa religio*). Constantine's declaration of tolerance resulted in Christianity's association with true religion in 313 CE.

With the fall of Rome, the term languished until shifts in political, economic, and social thought and order in the Middle Ages brought about its renewed use to describe a particular rite, community, or doctrine. The phrase *Christinia religio* emerged during the Reformation in an attempt to argue epistemological truth, positing the teachings and practices of the Roman Catholic Church over and against those of the protesters/reformers. During the Enlightenment, *religio* appeared as a plural (acknowledging many monastic orders), as a doctrine (a body of beliefs), as an internal matter (of the heart), and as a philosophical construct (an internal essence).

With European expansion and missionary movements, true religion was associated with Christian European society; other world religions, indigenous cosmological systems, and local practices were generally viewed to be false, superstition, or of the Devil.

Early Social Science

The Enlightenment marked the beginnings of a separation between intellectual inquiry and the Roman Catholic Church. A consequence of this separation was the emergence of philosophy, science, the social sciences, and religion as distinct disciplines. Scholars began to think about origins, social organization, life, death, the cosmos, and truth through empirical lenses rather than through the theological apologetic of the past. Yet this empiricism was clearly shaped by cultural and ideological constructs.

Positivism

The French philosopher Auguste Comte posited a unifying, posttheistic theory regarding social progress. Writing during the Industrial Revolution and with Spencerian and Lamarckian evolutionary ideas in the air, Comte argued that social progress could be explained using scientific methods. This positive

movement could be anticipated using hypothetic principles and measures.

Assuming unilineal social evolution, early anthropological approaches to religion adopted these principles. Edward Burnett Tylor, Lewis Henry Morgan, and James G. Frazer developed social evolutionary models (among others) contending societies' progress through specific evolutionary stages. Tylor concluded that religion exists in all societies in various degrees of sophistication and that the animism in what he terms primitive peoples, lower races, savages, and barbarians would give way to polytheism and finally monotheism. Morgan limited his discussion of religion, suggesting that its irrationality and emotional center made it difficult to understand and study when developing a model of social evolution. Frazer developed a hierarchal positivist model similar to Tylor's, asserting that magic will give way to religion, ultimately giving way to science. Magic and science shared the expectation that the world was subject to invariable natural laws. Human beings were able to explain and predict events based on magic or a scientific formula. Religion, on the other hand, asserted that the world was subject to capricious spirits. Given time, societies would abandon their dependence on spirits as they proceed along the evolutionary track. Émile Durkheim argued, contra Frazer, that although magic and religion shared essential elements, the former excludes the integrative moral character that befits a community. Magic, including ceremony, belief, and prayers, was largely utilitarian, whereas religion was a unified system, setting things apart within a singular moral community, such as within a church.

The Introduction of Ethnography

Functional and Structural Approaches

With ethnographic research, the focus turned to particular manifestations of magic, myth, and ritual. Some looked to the function of rites, others to their structure relative to the social whole. Bronisław Malinowski's study of garden and fishing magic focused on psychological states and ritual activity. Drawing heavily on Frazer's contentions regarding magic and human prediction and Freud's study of anxiety and security, Malinowski proposed a link between the ways specific terms associated with magic functioned in achieving the desired effects. Contra Malinowski, A. R. Radcliffe-Brown pointed to rites, taboos, and totems as the social glue that maintained social structure, contending that the function of rules regarding ritual is to maintain social order.

Contextual Particular Approach

North American historic particularism found anthropologists focusing on documenting information about the social and material culture of indigenous peoples before their assumed inevitable assimilation into the dominant North American society. Early on, Franz Boas and his students considered the relationships between various social practices and material culture as distinct evolutions rather than a singular progression, as was common in European social anthropology. Rather than arguing for a singular evolutionary model, early North American anthropologists documented many different religious practices as a part of the social whole, influenced and shaped by the local milieu.

Modern Anthropology

The Rhodes-Livingstone Institute

British anthropologists from the Manchester school focused on village structures, on conflict and resolution, which appeared to be in tension in their research in Central Africa. They found seemingly structurally incompatible elements (e.g., residency rules and lineage systems) amid social cohesion. At the same time, the introduction of Christianity, trade goods, and colonial rule was bringing ideological, social, and structural changes to these regions. Max Gluckman's emphasis on situational analysis emerged as structure functionalism, a perspective that considers the relationship between structures and the functions they serve within a particular social context. This attention to the part amid the whole shaped a generation of researchers. Amid segmentary opposition, the theoretical problem was how stability was maintained (and at times achieved) in times of conflict and change within African societies.

Victor Turner applied Gluckman's focus to his research on the ways ritual expressions create, reinforce, and modify existing social forms. Things that might appear contradictory to the positivist mind serve as practical solutions to social and individual tension. Cohesion does not exist because of consistent mental processes but rather through

the expression of shared ritual, each in and of itself a shared collection of words, actions, and material goods to which symbolic associations have been attached. Turner proposed that social drama (ritual) served several purposes. Within his oft-cited study of rites of passage, periods of anti-structure (liminality) are necessary, for they provide resolution to social tensions that, if left unresolved, would ultimately lead to the dissolution of the social order. The structural sanctioning (read ritual) of a liminal event clearly defines it, according to Turner, as a symbolic religious event.

At the same time that British anthropologists were focusing on the structural foundations of ritual, some North American anthropologists were adopting positivism in their work.

Neo-Positivism: Social Ecology, Materialism, and Social Biology

In the 1950s, some North American scholars applied new scientific methods to their work, proposing that environmental and material factors were ultimately the defining element in determining the shape, structure, and timing of ritual activity.

Julian Steward's attention to ecological specificity argued that religion, rather than being a priori, emerged within specific ecological settings to tend to mini crises in the lives of indigenous peoples. Birth, puberty, marriage, and death serve as points wherein ritual practices emerge. Roy Rappaport carried forth Steward's notions of cultural ecology: that human adaptation to the environment created culture. Religious activity is formulated through material resources, excesses, and limitations. Applying ecological functional methodology to the study of ritual, Rappaport argued that the human organism is part of an environmental system; human adaptation to the environment created culture. Ecological factors create the parameters as well as the reasons for ritual behavior.

Marvin Harris drew on Steward and Karl Marx in developing his own model of materialism. Harris posited that religious belief and ritual activity are rooted in practical matters tied to access to resources and the means of production. For example, in his analysis, South Asian cattle keeping and the accompanying rules about consumption, the handling of carcasses, and the use of by-products rely on complex caloric-exchange analysis, historical events, and legislation.

This new positivism is also represented in Napoleon Chagnon's research on the relationship between ritualized revenge killing and progenity. The relationships between violence, human conflict, and evolutionary reproduction suggest that genetic success is tantamount to cultural success, ritualized within the religious activities of particular communities.

Neo-Positivism: French Structuralism

Claude Lévi-Strauss proposed that common traits, components, and structural designs were shared by all myths—each representing attempts to reconcile the seemingly irreconcilable. These religious stories about the origins of the cosmos and of social relationships, identities, and responsibilities are fundamentally about creating order. By examining the binary oppositions that emerge in cultural myths, one could find common social tensions. Although the images and language may change, the issues remain the same in all cultures. All human societies, in effect, develop stories of identity and origin in an attempt to resolve identical experiential tension(s).

Some anthropologists embraced Lévi-Strauss's dialectical model, applying elements of it to their own research; others argued against both his methodology and his conclusions.

Responses to Neo-Positivism

Clifford Geertz, Mary Douglas, and Victor Turner are among those who proposed alternative models to these highly refined positivist models. Geertz argued that cultural unification is not a product of common cognitive formation. Instead, a particular religion is a complicated system of *symbols*—images, individuals, historical moments, language, or places—that people share in common. These symbols carry with them immediate affinity and a sense of connectedness with others who share those same symbolic representations. Nevertheless, what various narratives, rituals, and material goods mean are constructed by the participants, and these meanings are crafted by the ethnographer. Instead of committing to the centrality of a specific ritual activity, it was important to pay attention to the inner relationship between the various elements of the larger system of meaning. Rather than delineating particular universal rules or indices, anthropological writings interpret the interpretation of the cultural participants. To accomplish this, the ethnographer

must read culture as text, allowing the contextualized symbolic analysis to attempt to decipher meaning within the system in which it appears.

Douglas explored symbolic structure, extending Durkheim's focus on classification systems. In her analysis of ritual purity and contamination, she worked to uncover broad universal patterns that can be applied from one social setting or event to another. She considered the dialectic of clean and dirty as a symbolic structure for analysis. Solidarity exists when the sacred and the profane are properly delineated. Rules governing behavior create order by defining what is out of order.

Postmodernism

With the emergence of postmodernity, issues of representation, distribution of power, gender, voice, and authority became relevant in the study of religion. Emerging anthropological analyses of religion and ritual joined the larger academy in recognizing their relationships with power, authority, and place.

Feminist scholars of religion and anthropology challenged the dichotomy between public and private spaces relative to gender constructs. Unconvinced that the presumed universal subordination of women to men was natural, Sherri Ortner focused on the ways societies construct gender. Michelle Rosaldo and Louise Lamphere focused on religion and culture. Past studies of religion had largely focused on those who played public roles in ritual ceremony. The voices and experiences of women and marginalized individuals were generally ignored or filtered through the public social system. The sum of these critiques and theses was an invitation to reimagine access, identity, relationships, and voice in the study of religious movements.

Talal Asad challenged Geertz's definition of religion as a system of symbols, arguing that when a definition of religion privileges interiority over and against the structural normalcy inherent in some religious expressions then the definition is suspect. Geertz's definition of religion, according to Asad, was heavily laden with western European Protestant constructs and as a result was rooted in the context within which it was developed. Others, including Richard King, Stanley Jeyaraja Tambiah, and Morton Klass, criticized the use of the term *religion* given the sociohistorical overlay with which it had been infused.

Gananath Obeyesekere's challenge to Marshall Sahlins's interpretation of the death of Captain Cook as the returned deity Lono in Hawaii was representative of a movement that asked questions about the ability of outsiders to interpret indigenous actions and motives. Couched in the study of religion and the controversial interpretation of the meaning of Cook's death, the debate focused on cultural identity, reflexivity, and epistemology.

These and similar critiques resulted in a heightened cognizance of position, privilege, power, and place in the study of religion (e.g., Asad). Whereas positivism sought to identify absolutes based on verifiable data, postmodernity worked to liberate ideological construction from any particular foundation. Ethnographic research and literary style changed dramatically.

Attention to positionality and voice resulted in ethnographies wherein the ethnographer became intertwined in the local narrative. The ethnographies included a self-reflexive analysis of the relationship and role that researchers played in the experiences of their communities of study. Studies of women, individuals of color, and culturally situated data became the norm.

Contemporary Approaches to the Anthropology of Religion

The ongoing debate over whether anthropology should focus on the ethnographic enterprise, focus on the subjectivity of the researcher, or look for the underlying universals is present in the anthropology of religion. Some scholars continue the ethnological enterprise, documenting the effect of the past and present, gender, power, and locality on contemporary religious practices; some focus on the symbolic systems wherein meaningful constructs exist, adapt, and shape experience through semiosis; others suggest a need to engage what some called world religious systems that heretofore have been largely ignored; and still others have turned to cognitive science, advocating for the scientific analysis of language, ritual behavior, and magical tenets so that the underlying tenets of human reasoning might be uncovered.

Semiotic Materialism

The imbuing of material culture with symbolic meaning and power is drawing the attention of some (e.g., Matthew Engelke and Webb Keane). Bridging sociolinguistics and cultural anthropology, these scholars consider conflicts over the significance and meanings attached to material goods, gestures, and

concepts. Whether studying a religious movement's rejection of written sacred texts over and against direct communication with God or another's negotiation of the complex relationships between purification, modernity, and money, scholars focusing on objects and their meanings do so within complex sociohistorical postcolonial contexts.

Christianity

The past decade has seen a dramatic increase of publishing on Christianity by anthropologists. This upsurge in publications has provided glimpses into the diversity of thought and experience among people who self-identify as Christian. Encouraged by a small cadre (e.g., Joel Robbins and Simon Coleman), this growing canon includes glimpses into the rise of modern American evangelicalism, the independent indigenous movements, the various renditions of Pentecostalism, the mission trip phenomena, the relationship between missionary activities and current local praxis, and the various revitalization movements. Together these reflect anthropological attention to the relationship between historical and contemporary activities and ideologies.

Cognitive Science

Scholars working in the area of cognitive science continue the postpositive interest in developing empirically based models (e.g., Whitehouse). For example, some argue that the tendency of human beings to explain things, specifically to anthropomorphize material culture and natural phenomena, is evidence of the universality of religion. Others draw on psychology, anthropology, neuroscience, and cognitive science to argue that religion is important to people across culture, time, and space as a result of evolution of the human brain. Still others emphasize modes of religiosity, delineating between the imaginistic mode (infrequent, high-energy rites, as in puberty rites) and the doctrinal mode (repetitive, low-energy activities, with a goal of creating semantic memory). By linking neurological studies, cognitive science, and psychology with social behavior, unifying models for the study of religious consciousness and activity are possible.

Political Ecology

Hegemony, the subaltern discourse, praxis, reflexivity, freedom, and self-consciousness elicit attention from many scholars exploring socioreligious phenomena. Culturally imbued agency relative to colonialism and neocolonialism, transmigration, technology, development, linguistics, and gender relative to religion (to name a few) are receiving the attention of still others. As a part of this trend, some scholars are focusing on the globalization of various movements, including, for example, Islam, Christianity, Indigenous religions, and Hinduism. Together they consider the complex of actors as agents, their voices, and the social milieu in which they are engaged.

In short, the history and theory of the anthropology of religion has tended to follow the ebb and flow of the discipline as a whole. People researching religion from an anthropological perspective continue to provide helpful contributions to the discipline as a whole; theoreticians continue to model this thing called religion. The past is somewhat clear, the future a bit less so. In the present, the relationship between subject and object, the part and the whole, the self and the Other continues to inspire participants and observers in their quest for meaning.

Rhodes-Livingstone Institute

The Rhodes-Livingstone Institute was a most influential initiative in the ethnographic study of Africa and in the building of anthropological theory. Established in Northern Rhodesia (now Zambia) during 1938, its aim was to scientifically analyze social life in Central Africa. Godfrey Wilson (1938–1940) served as the first director and was succeeded by Max Gluckman (1941–1947), Elisabeth Colson (1947–1951), Bill Epstein (1951–1955), Charles White (1955–1956 and 1960–1965), and Henry Fosbrooke (1956–1960). Although financed by colonial governments, the institute distinguished itself as an independent center of learning. Most researchers held liberal or radical views, opposed White minority rule, and saw their task as preparing the way for independence. Many were later based at Manchester University, where they wrote up the results of their fieldwork. The Africans themselves used the anthropologists as vehicles to argue local causes.

Despite focusing on classical anthropological topics such as kinship, the Rhodes-Livingstone Institute introduced new subject matter, pioneered new research methods, and defined novel theoretical constructs. Affiliated researchers rejected the tribe as the unit of analysis and rather sought to conduct detailed ethnographic research on particular settings within an overarching, rapidly transforming Northern Rhodesian social system. This larger analytical frame compelled recognition of colonial presence, industrial enterprise, and migrant labor. The researchers treated Africans as integral actors in the modern world. Gluckman defined the larger social system in terms of the interdependence of institutions rather than common values. This enabled him to treat contestation and conflict as an integral aspect thereof. Researchers of the institute collected statistical data to complement ethnographic research, quantify variables, and make systematic comparisons. They also developed the extended–case study method. Here, the analysis starts with the observation of interactions among concrete individuals within specific settings, such as butchery, and then proceeds to ask questions about broader social relationships.

The most influential studies in rural settings were conducted by John Barnes (kinship among the patrilineal Ngoni), Elisabeth Colson (agriculture among the Plateau Tonga), Ian Cunnison (fishing and trade among the Luapula), Max Gluckman (legal processes in Barotseland), Hans Holleman (the Shona tribe as a political entity), Max Marwick (sorcery accusations and social tensions among the Chewa), Clyde Mitchell (kinship among the matrilineal Yao), Edith and Victor Turner (matrilineal kinship, symbolism, and ritual among the Ndembu), Jaap Van Velsen (politics of kinship among the lakeside Tonga), and William Watson (the Mambwe, tribal integration in the money economy).

Many studies by the Rhodes-Livingstone researchers showed the impact of labor migration on rural life. Gluckman recorded a predominance of family conflicts in Barotse court cases, arising from the absence of men. More cooperatively structured communities were not as hard hit. Watson argued that through patrilineal cooperation, the Mambwe managed to avoid the destructive impact of labor migration on agriculture. The Mambwe migrants earned money for marriage payments at home, spent intermittent spells in their villages of origin, and invested in land, which remained the ultimate basis of their economic security.

Victor Turner's 1957 work *Schism and Continuity in an African Society* exemplifies the emphasis on conflict. In the monograph, Turner analyzes several drawn-out disputes, over issues such as succession, as "social dramas." He shows how they illuminate tensions arising from the conflicting demands of virilocal marriage and matrilineal inheritance and how rituals are invoked to resolve the disputes by

affirming the deepest values of social groups. He depicts the Ndembu villages as marked by unstable compositions and as prone to fission.

Studies conducted in urban settings rejected the conservative view that Africans were essentially "tribal people" for whom urbanization implied social disintegration. Here, researchers of the institute sided with White liberals and African nationalists, who argued for investment in urban housing and amenities. On the basis of fieldwork in Broken Hill, a zinc-mining town, Wilson shows how Africans successfully forged new social relations. Wage earners invested in clothing and European-style housing, which signified status in the colonial world. Their marriages became not only more autonomous and interethnic but also unstable, due to unbalanced sex ratios. Dance clubs, rotating credit associations, and burial societies emerged as new social forms. Wilson saw the central problem in Northern Rhodesia as one of "social disequilibrium," in which industrial development occurred at the expense of rural societies. He suggested that equilibrium could be achieved only by stabilizing the workforce, removing the color bar, and investing capital in agriculture.

In *The Kalela Dance* (1956), Clyde Mitchell focuses on a popular Bisa dance and uses the extended–case study method to explore the intricacies of tribalism on the copper belt. The dancers were young male laborers, smartly dressed in European clothing and accompanied by a king, a doctor, and a nursing sister. Their songs heaped self-praise on the Bisa and made fun of other ethnic groups. Yet the dance did not originate in Bisa territory. Moreover, the songs were sung in Bemba—the lingua franca of the copper belt—and addressed urban experiences such as being converted by the Watchtower movement. For Mitchell, the dance is far removed from "rural tribalism"—an organized system of relationships based on chieftaincy and involved in managing land as a productive resource. Rather, the dance articulates "urban tribalism." In the multiethnic urban contexts, Mitchell claims, tribe is a category for social interaction and for classifying strangers. Here, Bisa men provide each other with hospitality and social support. They sustain joking relations—characterized by relations of permitted disrespect—with certain other tribes to ease hostility. Mitchell sees such tribalism as a situational identity: pertinent to social interaction among African workers but irrelevant when they collectively confront European management.

Bill Epstein's fieldwork in the town of Luanshya substantiates many of Mitchell's assertions. Focusing on the development of politics, he shows how a system of elected "tribal elders" replaced the unpopular African mine police. The elders represented the workers to management, and vice versa; settled minor offenses; and participated in urban courts. But the tribal elders played no role during the 1935 miners' strike, in which trade unions coordinated the industrial action. Moreover, workers supported the African National Congress, led by educated Africans, in opposing racial discrimination and the formation of the unpopular Central African Federation. Epstein too sees identities and alliances as dependent on the situations in which African workers found themselves. Mitchell and Kapferer subsequently focused analytical attention on social networks as chains of relations radiating outward from particular individuals.

After Zambia's independence, the institute no longer served as a locus for metropolitan anthropological research but attained a nationally defined social research agenda. Yet its actor-focused ethnographic perspective was to have a lasting impact on international scholarship.

Richards, Audrey

Audrey Richards (1899–1984), a social anthropologist and a social reformer, was a talented administrator and a committed advocate for the discipline. She

championed the study of colonial social change and anthropology's role as an applied social science.

Biography and Career

Audrey Richards was born in London in 1899 into a well-connected family of barristers, academics, and British colonial civil servants. Her uncles on her father's side included two colonial governors. The second-born of four girls, she had a privileged early childhood in India, before boarding school and reading natural sciences at Cambridge. Influenced by the idealism of her older sister Gwynedd, who became a social worker, she then spent several years in London working as secretary to the labor department of the League of Nations union.

She decided to pursue her postgraduate studies with Bronisław Malinowski at the London School of Economics and found herself attracted to his intellectual charisma and pedagogic flair. Joining a brilliant group of students in his research seminar, she was exposed to his functionalist idea that rites, beliefs, and customs play a necessary role in filling biological or social needs. While some of Malinowski's students later rebelled against his domineering personality, Richards remained loyal and, after the death of his wife Elsie in 1935, became his closest confidante, acting as a surrogate mother to his three daughters. They were even briefly engaged. Like all of her extensive correspondence, now in the London School of Economics archive along with her field notes, their letters to each other are full of intimacies and amusing academic gossip. Throughout her research career, she stayed true to his commitment to systematic data collection and careful empirical research.

As diet became an increasingly important topic among social reformers, Richards began to do a library-based PhD dissertation on nutrition. On the opening page of her doctoral thesis, later published as *Hunger and Work in a Savage Tribe* (1932), she gently questioned Malinowski's focus on explaining social systems in relation to sexual "needs." Instead, she argued that nutrition was more influential than any other physiological function on the nature of social organization. Encouraged by her supervisor to focus on the role women played in the economic and social life of an African tribe, she traveled to Northern Rhodesia in 1930 to carry out two periods of fieldwork on a previously unstudied group, the Bemba. This led to her most influential monograph, *Land, Labour and Diet in Northern Rhodesia* (1939), a holistic account of the Bemba in the Malinowskian mold.

Throughout this period, she was also teaching anthropology, first at Bedford College and then at the London School of Economics. Her ambitions, social connections, and talent at combining research, teaching, and administration guaranteed an influential career. Her next move was to become head of the department at the University of the Witwatersrand, during which time she both did further fieldwork and became very involved in helping an influential colonial reformer, Sir William Malcolm Hailey (Lord Hailey), with his multivolume *African Survey* (1938), a Carnegie-sponsored report on economic and social conditions across Britain's African colonies. This report called for the wholesale reorganization and prioritization of colonial research to inform postwar development planning. It was highly influential within Whitehall. With the outbreak of World War II, she returned to England and was employed by the Colonial Office to chair its nutrition committee. It was the ideal position from which to put Lord Hailey's recommendations into practice, and she became a key advocate for a new Colonial Office committee tasked with the social research required for a more rational approach to colonial development.

Her own appointment to this Colonial Social Science Research Council lasted almost 20 years (1944–1962), interspersed with a 6-year period as the founding director of the East African Institute of Social Research at Makerere in Uganda from 1950 to 1956. Aware of the quality of the social research conducted at the Rhodes-Livingstone Institute under the influential direction of Max Gluckman, Richards successfully convinced the committee to support a series of applied interdisciplinary social research institutes in the colonies: These were eventually set up in Uganda, Nigeria, and the Caribbean. While at Makerere, she directed a whole suite of empirical social surveys on aspects of agricultural and social change, as well as doing the hard work of pulling together a series of edited collections that resulted from them, including *Economic Development and Tribal Change* (1954), *East African Chiefs* (1960), and her sole-authored *The Changing Structure of a Ganda Village* (1966). As well as securing the reputation of the Makerere

Institute and its model of engaged and "relevant" social research, she also returned to her field notes from the 1930s and wrote *Chisungu: A Girl's Initiation Ceremony Among The Bemba of Zambia* (1956). Later, she sought to protect the independence of the research institutes as the first winds of independence blew across Africa.

Returning to Britain in 1956 and with a fellowship at Newnham College, Cambridge, she again demonstrated her skills at institution building, becoming the first director of Cambridge's African Studies Centre. She advocated the importance of training anthropology students in fieldwork methods, and with her Cambridge colleague Sir Edmund Leach, she persuaded a whole generation of Cambridge anthropologists to carry out their first research interviews in a collaborative ethnographic study of Elmdon, the village in which she lived. Greatly respected and admired by her students, many honors now accrued, including a Commander of the British Empire. She became the first female anthropologist to be elected to the British Academy and the Presidency of the Royal Anthropological Institute.

Despite her hard work, connections, and charm, her commitment to "applied" anthropology rather than to "pure" theory building meant that her academic contribution was never fully acknowledged by the award of a full professorship. Academic misogyny was a factor, and she was not helped either by her defensive attitude toward colonial policy in the period that followed African independence. Her success in securing the institutional future of the British discipline through colonial office funding and patronage in the 1940s and 1950s had to be its own reward.

Contributions to Anthropology

Richards's contributions to social anthropology were diverse and wide-ranging, and the most influential was her empirical work on nutrition and agricultural economics, her work on ritual and matrilineal kinship, and her quiet attention to gender. She championed applied anthropology and the study of social change at a time when both were unfashionable. They have since become key aspects of disciplinary practice. She also repeatedly drew attention to the importance of training in fieldwork methods.

Nutrition and Agricultural Economics

Richards's work among the Bemba sought to demonstrate that the material and productive economy of a people could not be separated from their political systems and symbolism. Championing a Malinowskian functionalist approach, her contribution through her 1939 work *Land, Labour and Diet* was to offer a detailed empirical study of how, as she put it, the "biological facts of appetite and diet are themselves shaped by the particular systems of human relationships" (p. ix). The quality of her research records on the Bemba *citimene* ("slash-and-burn") agricultural complex made it the basis of "*Cutting Down Trees*," a more regionally and historically contextualized restudy by Henrietta Moore and Megan Vaughan in 1994. However, their work shows how the original study ignored the changes wrought by the colonial administration on Bemba political authority, a surprising weakness given Richards's interests. This perhaps demonstrates the limits of a functionalist study of a single society, the difficulty of placing such studies in a comparative context, and the challenge of explaining social change within a functionalist paradigm.

Theorizing Matrilineality

Richards wrote several chapter-length accounts of matrilineality, the most important being her contribution to Radcliffe-Brown and Forde's *African Systems of Kinship and Marriage* (1950), in which she explored what she called the matrilineal problem: the tension between the recognition of descent through the female line and the social requirement for women to marry outside their kin groups. If a woman leaves her home when she marries, her brothers have to find some way of keeping authority over her children. Alternatively, if it is the men rather than the women who move, then they are separated from their home, where they have inheritance rights. Richards shows the various ways in which societies manage this problem, often by managing marriage and residency as a social process rather than as a one-off act. By comparing two broad groups of Bantu-speaking peoples across what is called the "matrilineal belt" of Central Africa, she is able to show the range of ways in which marriage and residence arrangements are developed to manage the tensions created by matrilineality, and how these are influenced by agricultural practices (e.g., shifting

cultivation), the value of land and other possessions, and local political structures. Her attention to the fine-grained details of rights and obligations, placed in a broad comparative context, made this piece a significant contribution to more structural approaches to kinship, while still staying grounded in the contingencies of the local political economy.

Writing on Ritual and Socialization

Richards's account of the elaborate puberty rites of two young Bemba girls and the role they played in a matrilineal society, told from the woman's point of view, was influential among female anthropologists, even if overshadowed by Victor Turner's rather more theorized interpretations of Ndembu ritual symbolism in his *Forest of Symbols* (1967). Richards underscored the socialization role of such rituals and criticized the lack of attention paid by anthropologists to questions of education and child rearing.

Documenting Colonial Change

Much of the research carried out by Richards at the East African Institute for Social Research was partly funded by the colonial authorities to address the direct effects of the colonial agricultural and development policy in Uganda—wage labor, migration, changing land use, experiments in local governance, and the introduction of councils—and even the effects of beer-brewing policies in Kampala. While not written for an anthropological audience, this work promoted the value of collaborative interdisciplinary work, as well as quietly documenting the huge social changes wrought by colonial rule. Although never a political critic of colonial power, and instead fond of describing herself as a "do-gooder," her intellectual interest in the effects of colonialism led her to write an innovative article in *Man* in 1942—about the "revival" of tribalism in South Africa as the result of struggles over land—and also a short Rhodes-Livingstone book titled *Bemba Marriage and Present Economic Conditions* (1942), which directly showed the effects labor migration was having on Bemba family structures. Challenging the dominant view that functional perspectives could not account for social change, this innovative work was nonetheless neglected by the discipline.

Richards's Legacy

Richards's pioneering career as a female anthropologist was acknowledged in the two collections of essays written in her honor—Jean La Fontaine's *The Interpretation of Ritual* (1972) and Shirley Ardener's *Persons and Powers of Women in Diverse Cultures* (1992)—and in the creation of the annual Audrey Richards Lecture at the University of Oxford. While never calling herself a feminist, she was all too aware of the challenges facing women academics of her generation, an issue she discusses in an interview titled "On Fieldwork" (available online).

As well as acting as an invaluable role model for her many female students, her commitment to linking theory and practice was pathbreaking, if never fully acknowledged. She showed how practical, policy-relevant research could carefully record the huge changes being wrought under colonial rule and how these in turn could generate theoretical questions and insights. Her administrative expertise and energy ensured funding for a generation of researchers, securing the reputation of social anthropology as an academic discipline within British universities.

Rites de Passage

Rites de passage is a type of ritual that goes through a three-phase transition at both physical and

psychological levels. The three phases at the physical level refer to the (1) *rites of separation*, (2) *rites of margin*, and (3) *rites of aggregation* (or incorporation). At the psychological level, the stages are the (1) *preliminal rites*, (2) *liminal rites*, and (3) *postliminal rites*. The classic study of this type of ritual was conducted by the French folklorist Arnold van Gennep, who published his work *Les Rites de Passage* in 1909. These rites are generally understood to include life cycle rites, calendaric or seasonal rites, festivals, and rites of "firsts." *Rites de passage* has become a fundamental concept and a theoretical model in many disciplinary studies, like anthropology and folklore, particularly following the translation of *Les Rites de Passage* into English in 1960.

van Gennep's Model

The formulation of van Gennep's model was the result of extensive ethnographic studies that stood in opposition to the trends in studying magic and religion at the end of the 19th century. Being critical of James G. Frazer and Émile Durkheim's separate classification of magic, ritual, and religion, van Gennep coined the phrase *magic-religious*, in which magic was the technique and religion was the theory, although the two aspects remained inseparable.

He also discerned a patterned sequence to rites of passage. In examining the processes of rites of passage, van Gennep paid attention to the interrelations between the temporal and spatial as well as physical and psychological aspects of rituals. According to his original discussion, the first stage of a rite of passage, the *rites de séparation*, marks a physical separation as well as a psychological *preliminal* state; the second stage of *rites de marge* keeps the subject physically marginalized from the social group while psychologically in a *liminal* stage; and the third stage of *rites d'agrégation* incorporates the subject both physically and psychologically back to the group with a new status through some *postliminal* rites. Van Gennep believed that both individuals and groups experience such a transition from one situation to another and that this transition is marked by time, place, social status, and spiritual worlds. These transitions reflect the different cultures that human beings have developed to satisfy their curiosity toward nature and themselves as well as to assuage their worries and fears.

The central idea in van Gennep's model is about the physical "margin" and the psychological "liminal." Discerning this threshold is helpful to understanding how ritual actions embody beliefs, how meanings are created and communicated, and how different cultures have developed different rites to serve similar purposes. Thus, this stage has much to do with our human cultural creativity, a realization essential to studying liminality. According to van Gennep, this is a stage of uncertainty: Whoever passes from one world to the other (between the sacred and the secular) finds himself or herself physically and magic-religiously in a special situation for a certain period of time—he or she wavers between both worlds. Such a situation is referred to by the term *margin*. It is from this sense that Victor Turner later developed the idea of *liminality*, for students and scholars of ritual studies. In developing this idea, however, one needs to keep a dynamic view of the process of marginality and liminality, as it is not static in either a ritual or a social sense, and to avoid stereotyping any group. For example, this model can be applied to studies of ethnic identity and migration, in which changing social contexts greatly influence the ritual symbols and processes, as well as the ways in which both insiders and outsiders perceive the individual and group identities. One problem in comprehending the model has to do with the English translation of *rites de marge* into "rites of transition" or "transition rites," since *transition* loses the meanings of "margin" and "liminal" at both physical and psychological levels.

In understanding and applying this model, van Gennep warns that one needs to be aware of three aspects. First, rites of passage are only one type of ritual, while some others may not contain the same transitional pattern. There are also various kinds of rites of passage. The commonly used terms like *life cycle rites* and *life crisis rites*, which concern the process of birth-marriage-death, refer to only one kind of *rites de passage*, while calendaric or seasonal rites, for instance, are another kind of rites of passage. Furthermore, not all rites of birth or initiation, wedding, or funeral are rites of passage, because they may include other rites of fertility, protection, divination, defense, or propitiation. Because not all peoples develop the same characteristics of rites of passage, there is no absolute uniformity in understanding the particular rites within the model. One may have noticed that the phrase *rite of passage* can be so idiosyncratic in everyday speech, or even misused as an academic term, that it is used to denote patterned actions that, unlike rituals, may

not have symbolic meanings. As seen in *Les Rites de Passage*, van Gennep discusses the model specifically from these aspects: the classification of rites, the territorial passage, individuals and groups, pregnancy and childbirth, birth and childhood, initiation rites, betrothal and marriage, funerals, and other types of rites of passage.

Second, the model of rites of passage can be applied at more than one structural level to analyze a ritual process. As van Gennep states, any rite may be interpreted in several ways, depending on whether it occurs within a complete system or in isolation, or whether it is performed for a certain occasion. While one's life, from birth to marriage to death, can be examined with this model, it is also possible to look at any stage itself as a process of rites of passage. For example, at the first level, birth is at the stage of rites of incorporation (as the end of one cycle) as well as at the stage of rites of separation (as the beginning of a new cycle), engagement-wedding-childbirth is in the stage of rites of margin, and death is at the stage of rites of incorporation (into the spiritual world) as well as at the stage of separation (from the living). But each stage can be further seen as a process of rites of passage at the second level. For example, the transition from engagement to wedding to birth giving forms a sequence of the rites of separation, rites of margin, and rites of incorporation. Furthermore, at the third level, the wedding ceremony alone can be analyzed with the model, in which the departure of the bride from her maiden house to her groom's house forms a series of rites of separation, the veil or carpet keeps the bride in the state of physical margin and psychological (liminal) uncertainty, and finally the bride is incorporated into her husband's family (in a patriarchal society) through rites of incorporation, namely, postceremonial feasts or games.

Third, the rites of margin are in the liminal stage, in which the subject is in an abnormal stage between the previous world and the unknown new world and thus is treated by his or her group or society in an abnormal way. This relates to the development of ritual liminality to social liminality or from studying marginality in a ritual sense to studying it in a social sense. Anthropologists such as Mary Douglas and Victor Turner, along with some sociologists, have expanded the studies of marginalized people undergoing a ritual process to the socially and politically marginalized people in greater societies. Douglas writes that the initiates behave like dangerous criminal characters during the marginal period in their socializing process, and to behave antisocially is the proper expression of their marginal condition. It is therefore consistent with the ideas about form and formlessness to treat initiates coming out of seclusion as if they were themselves charged with power—hot, dangerous, and requiring insulation and time to cool down.

Later Interpretations

Since many anthropologists and folklorists who refer to van Gennep's rites of passage are in fact more familiar with Victor Turner's interpretation of van Gennep's ideas, it should be noted that Turner's interpretation of the liminal stage differs from van Gennep's. Turner stresses aspects of the liminal as being outside the ordered universe, a period within the categories of ordinary social life, while van Gennep intends *rites de marge*, or liminal rites, to denote a passage from one state to another and focuses more on the patterned relationship *between* the stages than on the lack of order *during* the liminal period. Of course, Turner's development moves from considering ritual structure to social structure, and his focus is mainly on where transition in space-time is ritualized, *how* it is ritualized, the nature and properties of the ritual symbols and of their interrelations, and how these give us clues not only to the cherished values of the society that performs the rituals but also to the nature of human sociality itself that creates and transcends particular cultural forms.

In applying and further developing the ideas embedded in the model of the rites of passage, one should also consider the social changes, that is, the dimensions of racial, gender, ethnicity, occupation, and global or local contexts, in understanding issues like migration and the construction of cultural and ethnic as well as individual and collective identities. In simple societies, it is common that initiates return to their former group or society with a new status, forming a physical circular process. However, in modern societies, the ritual subjects at the conclusion of the rites of passage are often incorporated into a new group or society, with a new status, following a somewhat linear process. This physical or geographical change can be relative to the changing notion of border in a society or a nation (with the influence of globalization), while the psychological transition remains the same in nature.

The impact of the model of *rites de passage* has continued for a century after the first publication of van Gennep's book, and there are still ideas and subject matter worth exploring in new contexts. The distinction of physical puberty and social puberty, for example, was van Gennep's discovery in analyzing the rites of initiation, which contributed particularly to sociological and physiological studies. Understanding the legal, religious, cultural, psychological, and physiological definitions of puberty or adulthood may help us cope with the confusion and tension in life crises in our social and cultural interactions and help interpret the rites of passage in different cultures. The recent decades have witnessed the translations of *Les Rites de Passage* in languages such as Japanese, Korean, Russian, and Chinese, which will further attest to the universality of *rites de passage* in human practices. In anthropology and folklore, this model is seen by the folklorist Alan Dundes as one of the theories fundamental to folkloristics and the one with the greatest impact on folkloristic analysis. As a method of examining human behaviors in both rituals and everyday practices, the model illustrates the conformity of human life to cosmic rhythms, and it further emphasizes that there is much more to rites than models and sequences. Reflecting on the use of the model in the past century, one may find it to be still useful in gaining a deeper understanding of what is done in rituals and even in everyday practices in the increasingly complex and globalizing world.

Rivers, W. H. R.

William Halse Rivers Rivers (1864–1922) was a medical doctor, experimental psychologist, and pioneer of fieldwork methods, who became a key figure in the formative years of British social anthropology. Today, Rivers is most famous for his comparative work on sensory perception and for a series of experiments in neurophysiology with his colleague Henry Head; for his pioneering psychological treatment of traumatized officers during the First World War; for his contributions to kinship studies in the form of the "genealogical method" developed during fieldwork in India and the Pacific Islands; and for his role in establishing anthropology and psychology as professional fields.

Early Career

Born to a respectable middle-class family in Kent, England, Rivers was educated at the well-known Tonbridge School. His exposure to anthropology began early by way of his maternal uncle James Hunt, an eminent racial theorist, a speech therapist, and the founding president of the Anthropological Society. A lifelong stammerer with frail health, Rivers was prevented by sickness in his final year from taking the Cambridge University entrance examinations. Instead, he trained as a doctor at the prestigious research hospital St. Bartholomew's and at the University of London, where he gradually developed an interest in neurology and psychiatry. After a stint as a ship's surgeon in the Pacific and in Japan, in 1892, Rivers gave up his post at the National Hospital for the Paralysed and Epileptic and traveled to Jena, where he studied philosophy with Rudolf Eucken and attended lectures by the psychiatrist Otto Binswanger and the experimental psychologist Theodor Ziechen. He then worked at Bethlem Royal Hospital and lectured in psychology at Guy's Hospital and University College London,

during which time he also spent a summer working with the Heidelberg psychologist Emil Kraepelin, developing methods to scientifically study fatigue.

In 1893, Rivers moved to Cambridge University to teach and to undertake experiments in the physiology of the senses. There, he began a lifelong affiliation with St. John's College (eventually being made a fellow in 1902). In 1897, he took over the running of the new psychology laboratory in University College London.

In 1898, Rivers joined the Cambridge zoologist Alfred Cort Haddon, who was organizing the second Cambridge University expedition to the Torres Straits. The first, in 1888, had been a zoological survey of the islands' flora and fauna. The second was explicitly anthropological, aiming to document, and salvage, the social practices and customs of the Torres Straits, which Haddon perceived to be radically transforming due to colonial impact. The expedition team comprised six researchers, each of whom had responsibility for recording a different aspect of the society and culture of the Torres Straits. This collaborative endeavor also set the stage for the development of anthropology as a field-based science. Haddon recorded the local customs, studied decorative art, oversaw the collection of artifacts, and took anthropomorphic measurements. Rivers was responsible for experimental psychology, with a particular emphasis on vision. William McDougall studied tactile sensation. Charles Myers was a skilled musician and focused on hearing and music (recording music on the expedition's phonograph). Both were students of Rivers. Sidney Ray was the expedition's linguist. Charles Seligman researched traditional medicine and pathology. Anthony Wilkin was the official photographer and also investigated house construction and land tenure. The expedition became a landmark for the new discipline, producing several volumes of reports and refining methods of research and documentation. During this time, Rivers became intrigued by larger questions of cultural change and social organization and committed to further exploring the immense cultural variation and intermingling in the Pacific Islands.

The Genealogical Method

One of Rivers's greatest contributions to anthropology was methodological. Rivers was deeply invested in the formalization of anthropological theory and method and was an important contributor to the fourth edition of *Notes and Queries on Anthropology*, a methodological guide and reference manual for those working in the field.

During the 1898 Torres Straits Expedition, Rivers developed his famous contribution to ethnographic techniques: the genealogical method. At first, Rivers was drawn to document kinship relations between the islanders in order to research the heritability of certain psychological and physiological capacities. He soon realized that these kinship charts were also invaluable maps of social organization, presenting not only the local vision of relatedness but also models of political authority. The genealogical method not only allowed access into local lifeworlds and language, it demonstrated the social foundations of kinship. In addition, tracing genealogies was in itself a form of "culture history," moving backward in time to different points of cultural development and potentially highlighting the emergence of key cultural concepts and categories. Furthermore, tracing the heritability of certain physical and mental capacities demonstrated that there were more differences (on average) between the islanders than there were between the islanders and Europeans—an important contribution to contemporary debates about the nature of the difference between "primitive" and "modern" civilizations.

The genealogical method was the first step toward total linguistic immersion—a key strategy of the developing method of participant observation. It also underpinned the observation of how kinship (and marriage) formed the basis of more systematic social and political organization. The genealogical method became the mainstay of anthropological fieldwork—a young Bronisław Malinowski wrote to his friend John Layard in 1914, during their first ever stint of fieldwork, that he was collecting genealogies and was finding them indispensable, albeit difficult to manage.

The Todas

In 1901–1902, Rivers spent some months among the Todas of the Nilgiri Plateau in southwestern India. The ethnographic monograph that emerged from this fieldwork, *The Todas* (1906), was a holistic account of Toda social organization. Rivers made heavy use of his own genealogical method as a strategy to connect language and kinship terms to

broader principles of social organization. *The Todas* marks Rivers's first monographic attempt to systematically develop a theoretical matrix with which to interpret ethnographic facts, and it emphasizes his commitment to connecting fieldwork methodology and interpretive theory—the first marker of a professionalizing anthropology. Influenced by Lewis Henry Morgan's work on kinship, Rivers was increasingly interested in classificatory kinship terminology and the structuring and regulating capabilities of marital relationships (even those that no longer prevailed), in particular exploring the details of cross-cousin marriage.

Nerve Regeneration

Alongside his developing interest in South Asian and Melanesian cultures, Rivers continued to actively conduct research as an experimental psychologist, famously developing double-blind protocols for research on human subjects. His most well-known experiment was in collaboration with Henry Head. On April 25, 1903, Head had two cutaneous nerves of his left forearm surgically severed. He and Rivers charted the loss and reemergence of sensory perception in his arm until December 1907, when Head reexperienced normal sensitivity. The use of the self as subject in studies of peripheral nerve disorder and the intensive and longitudinal nature of this research made the experiment a milestone in experimental psychology methods. While Head and Rivers's hypothetical conclusion that there are three distinct sets of nerve fibers (deep sensation, protopathic, and epicritic) has since been disproven, the experiment remains influential in neurology and as a model of self-experiment.

The History of Melanesian Society and Theories of Cultural Diffusion

By 1904, anthropology was well established at Cambridge as a postgraduate diploma. A. R. Brown (later Radcliffe-Brown) became one of Haddon and Rivers's first students, undertaking fieldwork in the Andaman Islands from 1906 to 1908. In 1907–1908, Rivers traveled throughout the Solomon Islands and also to the New Hebrides (now Vanuatu), Hawaii, and Fiji. In the *History of Melanesian Society* (1914), Rivers was interested in mapping the ways in which social organization, kinship forms, and language migrated and transformed over time and distance. He was fascinated with what he termed "culture history": the evolution and subsequent diffusion of cultural traits, such as kinship and language, systematically over time. His comparative fieldwork across the island of Melanesia afforded him an empirical base to chart the diffusion of languages, concepts, rituals, and social structures.

In 1914, Rivers and a distinguished cohort traveled to Australia to attend the British Association for the Advancement of Science meetings, after which Rivers returned to the New Hebrides with John Layard to undertake further research into the megalithic ritual cultures of the Solomon Islands and New Hebrides. Rivers and Layard traveled together to the Small Islands of Atchin, off the coast of Malakula. They stayed on the island a few days, after which Rivers left to work with an old colleague, the Reverend Fred Bowie of the Melanesian Mission. Layard remained in the Small Islands for almost a year, an intensive period of research coterminous with Malinowski's first stint in the Trobriand Islands and now generally recognized as one of the earliest models for single-sited anthropological research. He later dedicated his volume *Stone Men of Malekula* (published in 1942) to Rivers: "To the memory of Dr. W. H. R. Rivers who once told me that he would like to have inscribed on his tomb-stone the words 'He made ethnology a science.'"

In addition to his methodological contributions, Rivers published on kinship, kava drinking, astronomy, and language, among many other things. He was an active member of the British Association for the Advancement of Science, becoming president of the anthropological section in 1911, and was also active in leadership of the English Folk-Lore Society and the Royal Anthropological Institute, while maintaining his professional commitments to psychology (in 1904, he founded the *British Journal of Psychology*).

Rivers was a close friend and colleague of Grafton Elliot Smith (chair of anatomy at University College London from 1919 to 1937). After conducting research in Egypt, Smith became convinced that ancient Egypt was the source of a subsequent diffusion of megalithic culture across the globe. Rivers, who had himself worked on color vision in Egypt with Myers and Wilkin in 1900, came to accept this hypothesis, positing that this was the probable origin point of a megalithic complex in Melanesia that included the raising of large stone monuments and

the mummification of the dead. The theory of hyperdiffusionism, and its attendant conflation of culture and race, was ridiculed by the academic community and did much to discredit Smith and his associates.

World War I

During the Great War, Rivers worked as an army psychiatrist and was eventually commissioned as captain in the Royal Army Medical Corps. He worked at a variety of military hospitals, where he treated soldiers afflicted with what he termed "war neuroses," the more popular term being "shell shock." Influenced by Freud, Rivers considered these neuroses to be a form of self-preservation undermined by repression. He not only advocated strongly for the recognition of these mental states as a form of affliction comparable to physical wounding but also emphasized the unique qualities of psychological experiences. Bringing his interests in experimental psychology and psychoanalysis together, he advocated that these afflictions be treated in their own terms rather than as correlates of physical disorders. In 1916, he was stationed at Craiglockhart Hospital for Officers, near Edinburgh, where he famously treated the writers Wilfred Owen and Siegfried Sassoon. Rivers made a deep impression on Sassoon, who wrote about Rivers in his fictionalized memoirs and kept in regular contact with him until Rivers's death. The story of Rivers's time at Craiglockhart has been fictionalized in Pat Barker's prize-winning series of novels.

After the War

This period was one of great personal fulfillment and transformation for Rivers. Fieldwork experiences both in the Torres Straits and in the hospitals treating World War I soldiers effected a kind of personal transformation from a shy, retiring academic to a confident and engaged public figure. His move to Central Hospital, London, in 1917 precipitated a new period of research and a new orientation of his life, away from the inward-looking structures of university life. His psychiatric work focused more on the methods and theories of psychotherapy, and he became greatly interested in the interpretation of dreams and in accessing the repressed and the unconscious. He reconnected with his former Cambridge colleague Bertrand Russell and became increasingly politically minded. He attended socialist meetings in London and became active in the Labour Party. In 1921, he was invited by the party to stand in the University of London constituency.

In 1922, Rivers was in Cambridge busy preparing his candidacy for political office, working with students, and writing a book on instinct and the unconscious. On the night of June 3, he was unexpectedly struck with a strangulated hernia and was only found the following morning. He died on Sunday, June 4, 1922. His last publications were the presidential address to the Royal Anthropological Institute, titled "The Unity of Anthropology," in which he presented a manifesto for a four-field anthropology comprising ethnology, archaeology, linguistics, and physical anthropology, and an edited volume from a conference that convened colonial administrators, ethnologists, and missionaries to discuss the implications of colonialism and contact—*Essays on the Depopulation of Melanesia*, one of the earliest books to address the impact of European influence and government on traditional culture and society.

Rivers left a lasting legacy. Several important works, including *Conflict and Dreams*, were published posthumously by Grafton Elliot Smith, his literary executor. His contributions to anthropological methods and to the professionalization of anthropology were felt deeply by subsequent generations of students, such as Malinowski and Radcliffe Brown, who were responsible for developing the first academic anthropology departments, even though their commitment to functionalism often obscured Rivers's interests in cultural, historical, and psychological issues. In recent years, Rivers has been recognized as one of the early founders of anthropology and has been restored as a father figure within the genealogy of professional anthropology.

Rivet, Paul

Paul Rivet (1876–1958), army doctor and French ethnologist, a key figure in international Americanism, a militant antifascist and antiracist, a socialist politician, and founder and director of the Paris Musée de l'Homme (Museum of Mankind) in 1937, was also among the founding fathers of French anthropology in the 1920s and 1930s.

Rivet was born in May, 1876, in the little village of Wasigny in northern France, as the second of six children in a modest Catholic family. He became an army doctor in 1897. Contrary to the General Staff and many of his comrades, he took up the cause of Captain Dreyfus as he did not share in their anti-Semitism. He also broke away from the family's Catholicism, not concealing his atheism and, even at times, anti-clericalism.

As a physician and a naturalist, he took part in the second French geodesic mission to Ecuador (1901–1906), where he carried out many archaeological excavations, took hundreds of anthropometric measurements, collected the vocabularies of indigenous languages as well as many objects, did some ethnographic fieldwork in the strict sense of the term, and above all did extensive ethnography at and around the various geodesic mission stations. As a doctor, he treated his Indian patients free of charge, thus winning their trust. This long period spent in the Andean Cordillera, investigating the past and present of the Indian peoples, was to drastically change the course of his life, since he became passionately interested in indigenous ways and changed his profession entirely to become an anthropologist.

Once back in Paris in April 1906, Rivet joined the Department of Anthropology of the National Museum of Natural History as a volunteer worker, where he studied and promoted the outstanding collections he had brought back from South America. He was able to enter the Parisian anthropology scene on the merits of his long experience in fieldwork. It is proof of the predominance of physical anthropology at the time that it was chiefly his contributions to this discipline that argued in favor of his scientific legitimacy. However, he turned away from this rapidly, as he felt that it led only to a dead end and that renewal of the discipline would come far more from ethnography and linguistics. When he was appointed assistant chairman of anthropology at the museum in 1909, he was able to give up his career as an army doctor and dedicate himself entirely to anthropology, to which he contributed greatly by redefining and dynamizing it. As a partisan of diffusionism, he wrote many articles on the classificatory linguistics of northwestern South America, bringing order into a field that heretofore had been poorly structured. His chapter on the synthesis of Amerindian languages published in 1924 in the famous work *Les langues du monde* (*The Languages of the World*) established him as a highly reputed international authority, as proven by Franz Boas's invitation to him to join the editorial committee of the *International Journal of American Linguistics*.

In 1912, Rivet published the results of his archaeological excavations (*Ancient Ethnography of Ecuador*) and continued to take an interest in techniques, studies of material culture, and most

especially pre-Columbian metallurgy, in which he became a specialist. He thus found a way to effectively highlight the empirical knowledge and know-how of Amerindians by demonstrating their inventive genius and technical skills.

At the end of World War I, he fought for scientific internationalism, finding in Franz Boas a powerful ally. He made the *Journal de la Société des Américanistes de Paris* into a leading international journal for communicating knowledge on South American ethnography right into the 1950s.

It was on the basis of linguistic evidence, supported by ethnographic data and physical anthropology, that he returned to a question that passionately interested him: the mystery of the origins of Native Americans. Rivet proposed a controversial theory on how the Americas were peopled, which became the subject of heated debate by his colleagues in the United States (Alex Hrdlicka, among others). Rivet rejected the idea that North America had been populated only by an Asian migration across the Bering Strait. He believed that the process had been far longer and more complex, possibly including Australian and Melanesian emigrations, which could have reached South America before the Asian immigrants came to North America. In 1943, he published his views in the *Origins of American Man*, a work republished many times in South America.

In the 1920s and 1930s, Rivet played a decisive role in helping ethnology gain university and institutional status in France. Along with his friend Marcel Mauss, he was responsible for codirecting the new Ethnology Institute (1925) and was elected professor of anthropology at the National Museum of Natural History in 1928, which gave him de facto direction over the Trocadéro Ethnography Museum, which became the Museum of Mankind in 1937.

For Rivet, the 1930s were years of intense commitment to militant antiracism and antifascism. He was head of the Vigilance Committee of Anti-Fascist Intellectuals (1934) and led the initiative in creating a journal, *Races et Racisme*, that fought against the Nazi racist ideology. In 1935, he was elected the town councilor of Paris from a list of leftist parties.

As soon as the collaborationist regime of Vichy was set up in 1940, Rivet resisted Marshall Pétain and was relieved of his duties. He took part in the Resistance network at the Museum of Mankind and barely escaped capture by the Gestapo in February 1941. Rivet left for Bogotá (Colombia), where he created the Ethnology Institute. In 1942, he visited Columbia University with Claude Lévi-Strauss.

After 1945, Rivet was elected a Socialist member of parliament twice and was among the French delegation to UNESCO. He supported independence for Indochina and opposed the repression in Madagascar in 1948, and although he at first defended the French presence in Algeria, he then condemned the use of violence and recommended that negotiations be entered into.

Paul Rivet died on March 21, 1958, at the age of 81.

Rockefeller Foundation

Rockefeller Foundation funding, particularly through the Laura Spelman Rockefeller Memorial, was critical to the support of fieldwork and the growth of anthropology as a discipline during the years between the two world wars. On both sides of the Atlantic, in the Pacific and in Africa, Rockefeller initiatives built infrastructure at major institutions, primarily universities, supported the work of academic superstars, and encouraged interdisciplinary work for the betterment of society. Although tensions between the biological and cultural approaches were never entirely resolved and funding declined precipitously as a result of the Depression, Rockefeller philanthropy supported anthropology at a crucial time

during its movement from museum to university and encouraged anthropologists to extend their fieldwork sites internationally. After World War II, as a result, anthropology was well poised to respond to government-funded research directed toward public education and internationalization.

The Place of Anthropology in Rockefeller Philanthropy

Rockefeller Foundation subsidiaries held varying relationships to anthropology and its subdisciplines. The Rockefeller Foundation per se began with an emphasis on medicine and public health, later channeled bureaucratically into the Rockefeller Institute for Medical Research and the General Education Board. The Laura Spelman Rockefeller Memorial, established in 1918 by John D. Rockefeller Sr. to honor his late wife's commitment to social justice issues, despite its small size within the Rockefeller enterprises, was the primary funding source for cultural anthropology. During the 1920s, the Rockefeller Foundation professionalized its staff and solidified a commitment to research as the preferred route to "the well-being of mankind," focusing on selected elite universities and increasingly on international ventures undertaken in collaboration with local institutions and scholars.

The Spelman Memorial was headed by Beardsley Ruml, Edwin Embree, and Edmund Day. Embree developed research in human biology that was heavily "psychobiological," evolutionary, and racialist in its assumptions. Day headed the Division of Social Sciences, which was consolidated in the foundation's 1928 reorganization, absorbing the Spelman Memorial. This division aided in refocusing much of the anthropological work of the foundation in the direction of the cultural and environmental research that increasingly dominated the social sciences. Clark Wissler, an Americanist anthropologist trained by Franz Boas, mediated between the racialism and behaviorism of Yale University's Institute of Human Relations (established by Ruml in 1921) and a more ethnographic cultural relativism, although the institute also supported primate field research by Robert Yerkes. The Rockefeller-subsidized National Research Council supported ethnographic work by Margaret Mead, Melville Herkskovits, and Otto Klineberg, among others. Eugenics-motivated initiatives in Sydney, Australia, floundered over personnel issues and moved in sociocultural directions with the appointment of A. R. Radcliffe-Brown in 1925. Yale, the National Research Council, and New York's American Museum of Natural History collaborated in extensive Pacific research with the Bernice P. Bishop Museum in Honolulu.

Ruml's Spelman Memorial supported interdisciplinary social sciences centers at the University of Chicago (subsidizing the appointment of Edward Sapir in 1925), Columbia University, and Yale. Block grants and liberal local interpretation of relevance allowed a wide range of research to be encompassed under the Rockefeller mandate. At Chicago, Fay Cooper Cole's archaeological work led to the establishment of a cultural and linguistic field school in Santa Fe. The Laboratory of Anthropology provided ethnographic training for a generation of anthropology students from Chicago and other major universities. The annual Hanover Conferences at Dartmouth established a think tank that brought together the superstar scholars of the interdisciplinary amalgam. Sociology and psychology were paramount, but Sapir's charisma and wide-ranging vision ensured that anthropology would mediate perspectives toward the relationship of group and individual.

Support of British anthropology leaned toward the functionalism of Bronisław Malinowski, with its potential for application to colonial administration rather than to historical or diffusionist approaches. Conceding the Pacific to Radcliffe-Brown, Malinowski turned to Africa and to functionalist studies of acculturation, channeling fieldwork funding through the International African Institute.

A proposed Division of Behavior and Personality headed by Leonard Outhwraite intended both American Indian and international research but foundered on the Rockefeller Foundation's decision to curtail support for anthropology by 1933. The height of the Depression favored more urgent social problems than the "vanishing cultures" studied by anthropologists. The anthropologists, having grown accustomed to relatively munificent Rockefeller support, were puzzled and largely retreated from interdisciplinary social science research until the postwar government-sponsored area studies gained momentum.

The Rockefeller Legacy in Anthropology

The legacy of the Rockefeller Foundation was critical to the very survival of anthropology during the

interwar years. At the turn of the 20th century, support for anthropological fieldwork was centered in museums and their collections of artifacts. Ethnological and linguistic studies were secondary in the priorities of museums and the individual philanthropists who supported them, such as Phoebe Apperson Hearst in California, Sara Stevenson in Philadelphia, and Mary Wheelwright in the Southwest. Archaeology and physical anthropology were easier for potential donors to understand because their products were visible; the Carnegie Foundation provided extensive support for these subdisciplines. Only the Rockefeller Foundation offered a systematic vision that included cultural anthropology.

In his 1992 volume of essays on the history of anthropology, George W. Stocking emphasized that anthropology has always been a small discipline with little political or social capital to appeal to philanthropy. Anthropologists found few sources for research funding, because ethnography in distant places did not seem directly relevant to the larger issues of social engineering in the behaviorist mode that dominated the political economy of the social sciences during the interwar years. The tactics of the relatively powerless, however, fit well in the interstices of Rockefeller plans for strategic research. During the brief period of Rockefeller engagement with anthropology, and despite the relatively small amount of money directed toward the discipline in these plans, only $26 million out of the $228 million distributed by 1934, anthropology claimed a central role in the social sciences through Rockefeller funding of Hanover Conferences and Chicago and Yale interdisciplinary initiatives and through support for the emergence of culture and personality as an alternative to sociobiology.

Róheim, Géza

Géza Róheim (1891–1953) was a Hungarian American anthropologist, psychoanalyst, and folklorist, who pioneered psychoanalytic anthropology.

Biography and Major Works

As the only child, Róheim grew up in the privileged milieu of a Budapest merchant family. He was profoundly influenced by the patriotism of his grandfather, who also instilled in him a love of worldwide folklore. Róheim began to acquire an almost encyclopedic knowledge of myths, legends, ethnology, and prehistory; and the insights later gained from anthropological fieldwork and clinical experience, culminating in the development of his ontogenetic theory of culture, cannot be divorced from these early foundations. It was during the years of childhood and adolescence that Róheim anchored his thinking in cross-cultural comparison and the unity of humankind.

At the age of 20, Róheim published *Dragon and Dragon Killers* (1911), a mythological study that draws on Edward Burnett Tylor, James G. Frazer, Ernest Crawley, Leo Frobenius, Arnold van Gennep, and Franz Boas. He subsequently studied philosophy, law, and linguistics at the University of Budapest and geography in Leipzig under Karl Weule and under Felix von Luschan in Berlin, where he gained his PhD in 1914. Freud's *Totem and Taboo* first appeared in 1912–1913, and it was during those years of study in Germany that Róheim became familiar with the psychoanalytic works of the Viennese-Hungarian circle, also including C. G. Jung, Karl Abraham, and Sándor Ferenczi. Their emergent theories provided the original impetus for the anthropological approach to sexual development that Róheim was to fully develop.

Back in Budapest, Róheim entered into a training analysis with Ferenczi in 1915. His marriage to Ilonka in 1918 was to be an extremely close and lifelong union, without which he appeared unable to work. In 1921, he received the annual award for applied psychoanalysis for his impromptu

presentation, "Australian Totemism," at the Hague Congress in 1920 (published in 1925) and for his study *Das Selbst* (The Self) a year later. By now an active member of the Hungarian Psychoanalytic Society, Róheim also briefly held the first chair of anthropology at the University of Budapest. He published significant articles throughout the 1920s (including "*Nach dem Tode des Urvaters*" [After the Death of the Primal Father], 1923), in which he began to cautiously revise Freud's "primal horde" theory—the phylogenetic hypothesis of the origins of the incest taboo, totemism, and exogamy presented in *Totem and Taboo*—by exploring in detail the links between ontogenesis and social evolution. His turn toward the individual as the source of cultural productions reflects his disinclination to accept the notion of a group mind necessary in Freud's reconstruction of the killing of the father by one generation of sons and the guilt-driven transformation of this act into totemism over countless later generations.

The publication in 1927 of Malinowski's *Sex and Repression in Savage Society*, which rebuts the universality of the Oedipus complex, instigated Róheim's fieldwork (1929–1931) in the island of Melanesia (Dobu) and in East Africa (Sipupu), Central Australia (Arrernte, Pitjantjatjara, Pintupi), and Arizona (Quechan Yuma). This was the first ethnographic research by a trained psychoanalyst.

After having taught again at Budapest University (1932–1938), Róheim and his wife left for the United States and settled in New York City in 1940. He lectured at the New York Psychoanalytical Institute and worked in private practice until his death in 1953.

Róheim authored 20 books and roughly 160 articles. He regarded his *Children of the Desert* (published in two volumes in 1974 and 1988) as his magnum opus. *The Riddle of the Sphinx or Human Origins* (1934), *The Origin and Function of Culture* (1943), *The Eternal Ones of the Dream. A Psychoanalytic Interpretation of Australian Myth and Ritual* (1945), and *Psychoanalysis and Anthropology: Culture, Personality and the Unconscious* (1950) are held to be his major works.

Critical Contributions to Anthropology

Róheim's contributions to anthropology comprise a major theory of the origin of culture; a range of ingenious insights into the psychosexual underpinnings of particular cultural institutions, which are relevant to contemporary gender theory and the anthropology of childhood; unique ethnographic material; and interdisciplinary fieldwork techniques.

On account of his comparative approach and the links between child socialization and character development, Róheim's greatest impact was on the culture and personality theory developed in the 1930s and 1940s by the American anthropologist Ruth Benedict. Yet with few exceptions, notably Margaret Mead, Edward Sapir, George Devereux, and Weston La Barre, the American anthropological community denied Róheim full recognition.

Legacy of Ethnographic Work in Central Australia

Pivotal to the development of his own theoretical position was his field research in Central Australia, conducted over 8 months in 1929. Working with Pitjantjatjara, Pintupi, Luritja, and Arrernte speakers at the Hermannsburg mission and Tempe Downs station, Róheim recorded 129 folk narratives and myths. He employed projective play techniques (dolls play), dream analysis, and in-depth interviews, in addition to participant observation of ritual, child socialization, and other aspects of everyday life. Errors of ethnographic and linguistic detail notwithstanding, much of what he had to say about the Central Australian Aboriginal lifeworld has stood the test of time and is acutely relevant: His view, expounded in *The Eternal Ones of the Dream* (1945), that myth and ritual are attempts to imbue the environment with libido offers one explanation for the widely described attachment of the Aboriginal people to their land; his explication of the indigenous, land-based mythopeia—the Dreaming—as arising from the experience of nocturnal dreaming, where a withdrawal from the environment and toward one's own body allows for the creation of a whole new world, prefigures the now acclaimed analysis of Australian Aboriginal psychoontology by Nancy Munn, *The Transformation of Subjects Into Objects in Warlpiri and Pitjantjara Myth* (1970); his psychoanalytic interpretation of initiation rites, together with his observations on adult-child relationships, presents important conceptual stimuli for current research on relational ontology; and his interpretation of Aboriginal children's sexual freedom as basic to the structuring of

social and cultural capacity is significant in light of the increased focus by the Australian government on child well-being and the renewed pressures of cultural assimilation.

Ontogenesis and Culture

Róheim articulated his ontogenetic theory of culture most concisely in *The Origin and Function of Culture*. Drawing heavily on the notion of neoteny developed by the Dutch anatomist Louis Bolk, he saw that, for the individual as much as for humanity at large, prolonged infancy and sexual retardation are the cause of early emotional conflicts in the narrow field of the family milieu. These are retained and symbolically sublimated in adulthood as cultural adaptation. This unitary principle of evolution—rather than natural or sexual selection—has led to human existence, whose cultural variation could now be explained as the outcome of specific childhood traumata.

Róheim developed a second strand of his ontogenetic theory of culture, one that pivots on the concept of "dual unity" between mother and child as the basis for social integration. Influenced by primatological observations, Róheim recognized the importance of play, where instrumental action and clinging to the mother (or her breast as part object) become transformed into imaginary games of symbolic value: Here, in what the British psychoanalyst Donald Winnicott came to call *transitional space*, lie the origins of culture—the human capacity for concept formation, the constancy of self-consciousness, and the reality principle (delayed gratification).

Rosaldo, Michelle Zimbalist

Michelle (Shelly) Zimbalist Rosaldo (1944–1981), an American anthropologist, was one of the central figures responsible for revitalizing feminist anthropology in the 1970s and early 1980s. She also made signal contributions to symbolic, linguistic, and psychological anthropology and laid the groundwork for unifying the study of gender, kinship, and politics.

Biography and Major Works

Rosaldo was born in New York City and attended Radcliffe College, earning her bachelor's degree from Harvard in history and literature. While an undergraduate, she spent a summer in Chiapas, Mexico, under the supervision of George A. Collier and Evon Z. Vogt. She conducted graduate studies in social anthropology in the Program in Social Relations at Harvard, where she and her husband, Renato, completed their PhDs. With Renato, she conducted fieldwork between 1967 and 1969 among the Ilongot of northern Luzon, in the Philippines. Her dissertation, *Context and Metaphor in Ilongot Oral Tradition*, concerned the figures of speech through which the Ilongot expressed notions of self and emotion. It exemplified her distinctive approach to emotion, one that placed the emphasis on the symbolic and discursive production of self in a social order rather than on interior states. This would later lead her to question the idea of different logics or systems of meaning separate from the relationships of rank and order that make up a particular social world.

After receiving their PhDs, the Rosaldos were appointed to the Department of Anthropology at Stanford University. It was still rare at that time for women to be hired at elite universities. Ben Paul, the then department chair, had been able to secure a

full-time position and split it between Jane F. Collier and Shelly. Jane and George Collier occupied 1½ slots and the Rosaldos, the other 1½. The Rosaldos continued to sit on a 75% position each for several years. At Stanford, Shelly began her inquiry into the apparently universal devaluation of women relative to men. With Jane F. Collier and others, she developed a theory of gender based on social constructions of prestige that could provide a cross-cultural account of women's inequality without recourse to biological determinism. They also rejected the concept of subordination since even where women were powerful and not subordinate to men, men's activities were still more highly valued.

At Stanford, Rosaldo organized and cochaired the university's first Committee on Feminist Studies in 1980–1981 and helped develop curricula and programming for the Center for Research on Women. She participated actively in two Faculty Seminars, one on interpretative approaches in social inquiry and the other on feminist studies. She received a residential fellowship at the Institute for Advanced Study at Princeton University in 1975–1976 and at Stanford's Center for Advanced Studies in the Behavioral Sciences in 1979–1980.

Rosaldo was active in campus politics, working to draft a University Statement on Academic Freedom in the aftermath of the firing of the tenured English professor H. Bruce Franklin, a Melville scholar who led a group of students to occupy the Stanford computer center to protest the U.S. invasion of Laos in 1972. Rosaldo became a strong voice for ethical investment policies, academic freedom, and affirmative action. She was elected by her peers to serve on Stanford's Academic Senate. She was also known as an excellent teacher, and in 1979, she received the Dinkelspiel Award in recognition of her service to undergraduates.

She returned to the Philippines in 1974 and again in 1981 on a Fulbright with the University of the Philippines at Baguio, where she was beginning a project with Renato among the Ifugao. While walking along a path with two Ifugao, she slipped and fell to her death 65 feet down a ravine and into a river. In addition to Renato, she was survived by her two sons, Samuel Mario and Manuel Zimbalist Rosaldo. Members of her immediate cohort of colleagues, and many anthropologists of her generation, experienced the loss acutely. She was widely regarded across the field of anthropology as one of its leading lights. Anthropologists from subdisciplines that would profoundly diverge in the 1980s attributed to her some of their best insights and dedicated their work to her.

Critical Contributions to Anthropology

Rosaldo's contributions span feminist and gender studies, symbolic anthropology, the anthropology of emotions, and cognitive and linguistic theories of language use.

Women in Culture and Society

Rosaldo's landmark collection, *Woman, Culture and Society*, was coedited with Louise Lamphere and gathered together essays by 16 women social scientists (mainly anthropologists) to examine the devaluation of women to men cross-culturally. In assuming universal sexual asymmetry, Rosaldo explicitly challenged evolutionary and certain more vulgar Marxist approaches that searched for the origins of gender inequality rather than trying to understand it in light of ongoing social relations. She called attention to what she termed the public and domestic spheres, the former encompassing and limiting the latter. The public/domestic dichotomy was a heuristic device to understand how child-rearing and "home" tasks limited women's participation in other affairs and how they subsequently came to be symbolically and socially devalued. Rosaldo speculated on the broader social and political consequences were men to assume a larger role in child rearing. Other contributions in the book focused on the variability among women's positions within and across societies, opening up the ethnography of women. Later, Rosaldo would recognize that the public/domestic dichotomy was a product of class-based, capitalist societies and not a neutral analytical tool. With Collier, Rosaldo expanded her work by comparing models of gender and kinship in various "simple" societies—those characterized by other anthropologists in terms of bride wealth and bride service. The focus was on socially created systems of inequality and prestige. Collier continued this work in her volume *Marriage and Inequality in Classless Societies* (1988); and Collier and Sylvia J. Yanagisako, also at Stanford, carried on the analysis in *Gender and Kinship: Essays Toward a Unified Analysis* (1989). Second-wave feminist scholars in the 1970s discovered the field of anthropology, hoping to find there evidence of women in other cultures

who were valued as men's equals or betters. Rosaldo was critical of this quest. For Rosaldo, the ethnographic record could not sustain such an assertion, and the demand for anthropology to contribute to feminism in that way was born more of a quest for origins than a response to actually existing, and varied, social arrangements in which women and men find and make themselves.

Emotions and Social Life

Rosaldo's book *Knowledge and Passion: Ilongot Notions of Self and Social Life* (1981) is a rich ethnographic account of the way the Ilongot talk about emotions. Headhunting was practiced by men during her first visit in 1967. It continued even after the state's attempt through martial law to abolish it in 1972. It remained a significant part of the men's narration of self. Rosaldo redescribed headhunting not as the acquisition of the vanquished's soul substance or energy but rather as the lifting of a weight from the headhunter's heart. Delving into Ilongot metaphors and categories associated with headhunting, hearts and passion, and knowledge and health, Rosaldo argued that the Ilongots did not make a utilitarian calculation that taking a head would convey to the hunter the energy of the dead, and that the Ilongots did not take home the severed heads. Rather, headhunting helped organize and explain a social world where people felt weighted down with envy at others' accomplishments and needed a way for energy to be released and renewed so that they could achieve more productive ends. Her account was thoroughly social. She argued that earlier accounts of headhunting suffered from the anthropologist's desire to locate a motive—an interior state—which presumed a model of self foreign to the Ilongots' repertoire of personhood and society. Rosaldo invoked Wittgenstein on the need to seek out the "tone" of discourse and the "forms of life" rather than local logics. The book was exemplary of a new kind of interpretive ethnography and was influential in psychological and linguistic anthropology.

The Things We Do With Words

Rosaldo's work on language took Western theories of linguistic action as the ethnography of Western societies and social preoccupations, not descriptions of universal truths. Rosaldo set Ilongot notions of language alongside the speech act theory of J. L. Austin and J. Searle. Developed while she was at the Center for Advanced Study with Michael Silverstein, and after reading Derrida and Grice, this work linked language use to social rank and forcefully argued that relations, not intentions, should come first in the analysis of language. Rosaldo argued that promises and performatives, Austin and Searle's modal speech acts, presume an interior, autonomous self to the neglect of the social relations in which such selves are made. Notions of sincerity central to the felicity of such speech acts fall away when speakers like the Ilongots issue directives not about interior states or actor-based intentions but rather the affirmation and maintenance of ongoing social life.

Rosaldo's Legacy

Michelle Zimbalist Rosaldo's legacy remains her contributions to feminist anthropology and the effort to account for universal sexual asymmetry without biological reductionism. She posed a profound reformulation of anthropological relativism and reflexivity, which, despite their attempt at critical purchase, still reproduced contemporary Western assumptions about human personhood. Her emphasis on the relational and thoroughly social aspects of human existence and her insistence on humans as social persons first and individuals second—if at all—remain a profound challenge to anthropology.

Rosaldo, Renato

Trained as a symbolic and structuralist anthropologist in Asian and Latin American cultures, Renato I. Rosaldo Jr. moved beyond disciplinary boundaries to become one of the most notable anthropologists, and the most distinguished Chicano anthropologist, of the 20th century. His work helped decolonize and transform sociocultural anthropology, particularly the ways in which fieldwork, ethnography, culture, and social analysis are conceptualized in the contexts of the humanistic and social sciences as well as higher education more broadly.

Early Life and Fieldwork

Rosaldo was born in 1941 in Champaign, Illinois. His father, a university student from Mexico, immigrated to Chicago in 1932 and eventually went to the University of Illinois, Urbana-Champaign, where he met and married Rosaldo's mother, who was from Illinois. His father became a professor of Spanish at the University of Wisconsin at Madison in 1945, and Rosaldo lived there until he was 13 years old, when his father obtained a position at the University of Arizona. He started comprehending more about his own Mexican family and heritage, the nature of Mexican communities, and the presence of racial-ethnic and class differences when his family moved to Arizona and he started spending summers in Guadalajara, Mexico. Although he did not live in a Mexican barrio, his public high school served the entire city, and he made friends with other working-class Chicanos, including *pachucos*, or young Mexican men with distinctive cultural and linguistic practices, and he belonged to a *palomilla*, or ganglike group of mostly working-class boys.

Immediately after graduating from high school, in 1959, he enrolled in Harvard, where he remained until he earned a PhD in 1971. From about the mid-1950s to mid-1960s, Rosaldo was the only Mexican American student at Harvard. He, along with other public school students, mostly African Americans, had received grants to attend the elite university. Because this segregated group of students was required to clean the dorms in exchange for scholarships, Rosaldo and some of the other students developed a stronger consciousness regarding their position in society. Rosaldo has said that because Harvard offered very few courses in Latin American studies, he obtained an AB in Spanish history and literature (1963).

Following his mother's suggestion, Rosaldo took a course in anthropology and enjoyed it so much that he began conducting summer fieldwork in Ecuador and Peru (1961–1962) as an undergraduate. As a graduate student, Rosaldo studied with Evon Vogt, David Maybury-Lewis, Cora DuBois, and the teaching assistant Laura Nader, among others, and met many students who would become notable anthropologists, including his wife, Michelle Zimbalist Rosaldo (1944–1981, m. 1966). He and Michelle conducted research with the Harvard Chiapas Project in Mexico (1965–1966), and he produced his first article when he was still a graduate student—"Metaphors of Hierarchy in a Mayan Ritual," published in *American Anthropologist* (1968). Rosaldo and his wife carried out joint fieldwork in northern Luzon, Philippines, in 1967–1969, 1974, and 1981.

Ilongot Headhunting

Rosaldo was introduced to the works of Clifford Geertz shortly before he took his doctoral exams. Soon after Renato Rosaldo and his wife were hired by Stanford University's anthropology department (1970–2003), they, along with several other faculty, invited Geertz to their campus. Geertz in turn invited the Rosaldos to the Institute for Advanced Study in Princeton, New Jersey (1975–1976), where they became lifelong friends and colleagues. At the institute, Rosaldo developed an interest in critical social history, resulting in a groundbreaking and award-winning historical ethnography, *Ilongot Headhunting, 1883–1974: A Study in Society and History* (1980). Also influenced by postcolonial, racial-ethnic, and feminist movements, he chronicled the history of a tribal culture in terms of spatial analysis, situated local practices within global events, and challenged the presumed dichotomy

between social structures and human agency. In *Ilongot Headhunting*, Rosaldo did not seriously consider the Ilongots' assertions that one of the reasons they headhunted was to rid themselves of their grief and rage. However, in 1981, when Renato lost his beloved wife and partner from a tragic hiking accident in the Philippines, and was left to be a single father for his two young children, he became consumed by his own grief and rage. With this change in his subjectivity and positionality, he came to reconsider the Ilongot assertions and better understood how the power and force of emotions could lead them to kill others and throw away their heads as a way to rid themselves of their own rage. Rosaldo first published an essay on this topic in 1984, but he never posited that rage is the only reason Ilongots headhunt, or that it is a universal explanation for headhunting, which, he noted, can also be part of a coming-of-age ritual that deals with personal turmoil and helps create social order or a way to obtain power. Nevertheless, reconsidering emotions and how they affect subjectivity was a key shift that opened doors for others to reevaluate objectivity.

Postcolonialism, Postmodernism, and Ethnic/Chicano Studies at the Crossroads of Anthropology

By the 1980s, Rosaldo was increasingly embracing his interest in Chicana/Chicano and Latin American studies. He coedited *The Inca and Aztec States, 1400–1800: Anthropology and History* in 1982; and in 1985, he produced an article, "Chicano Studies, 1970–1984," for the *Annual Review of Anthropology*. He also served as director of the Center for Chicano Research at Stanford from 1985 to 1990 and began to write about racial-ethnic relations in Asia, Latin America, and the United States, including a reassessment of the concept of assimilation.

By the mid-1980s, Rosaldo had married the literary critic and fellow Stanford professor Mary Louise Pratt, and they both became involved in a movement, led by women and ethnic minority students and faculty, to incorporate non-Western and nonmale texts and perspectives into scholarly and literary canons, especially in Stanford's core course on Western civilization. As well-known leaders of the movement to transform the university and its curriculum, they became embroiled in both campus and national controversies, sometimes dubbed "the culture wars." The couple also became contributors to one of the most legendary and controversial books in anthropology, *Writing Culture: The Poetics and Politics of Ethnography* (1986). Associated with postmodernism, this group of scholars argued that postcolonial anthropology must critically analyze the relationships of field-workers to the people they studied, focusing in particular on writing as a form of representation and on the production of knowledge.

Continuing his activist scholarship and disciplinary border crossing, Rosaldo was always the person to couple critical analysis with solutions. His 1994 article "Whose Cultural Studies" recognized how powerful, mainstream academics were institutionalizing new venues for cultural studies scholarship and programs. Recognizing that these new programs were effectively displacing older, traditional anthropologists, as well as displacing and ignoring ethnic scholars and ethnic studies programs, Rosaldo suggested ways to incorporate all three groups. By this time, he was also publishing more work in Spanish as well as exploring the role of creativity and playfulness, both in society and as a form of ethnographic analysis, ultimately coediting a volume, *Creativity/Anthropology*, with Smadar Lavie and Kirin Nirayan (1993).

Culture and Truth

Rosaldo reconceptualized the major tenets of anthropology and other social sciences in his groundbreaking book *Culture and Truth: The Remaking of Social Analysis* (1989). As a postcolonial Chicano scholar, he eschewed a purely academic press and writing style, publishing instead with Beacon Press in an effort to reach a broader audience. Major concepts of the book include his critique of positivism, especially the idea that the best—or only—way to do social science was to be rational and detached. His satirical portrait of "the lone Ethnographer" instead posited that an individual's positionality (location within a social structure), subjectivity, emotions, and experiences provide equally valid, and sometimes more appropriate, ways of understanding social and cultural processes.

Culture and Truth also theorizes the concept of culture and how it is analyzed. Following Geertz, Rosaldo defines culture broadly as the forms through which people make sense of their lives, and

he further suggests that anthropologists examine not just the patterns and consistencies of culture but also its fluidity, ambiguities, conflicts, and changes. Drawing from Gloria Anzaldúa's revolutionary book *Borderlands/La Frontera: The New Mestiza* (1987), he suggests that cultural borderlands are constructed via historical and political processes and are characterized by differentiation at both internal and external levels. Alternatives to what he calls anthropology's period of classic norms (1921–1971) include blurring the boundaries between social science and the humanities, dialogic interaction with the people we study, attention to the force of emotion, and narrative forms of writing. Understanding culture as perpetually dynamic, he advocates using a case history method to conduct processual analysis, moving away from a focus on social norms and structures to include ambiguous, spontaneous, improvised, and disordered cultural processes. In addition to Anzaldúa, his model is influenced by the work of scholars such as Clifford Geertz, Victor Turner, Sherry Ortner, and Pierre Bourdieu, but he focuses less on mechanisms of control and more on the interplay between culture, structure, agency, and power, suggesting that scholars such as E. P. Thompson and Raymond Williams offer theoretical concepts to assist with processual analysis. Although this book did not receive any awards when it was first published, it was reissued with a new foreword in 1993, the same year when Rosaldo received a John Simon Guggenheim Fellowship, and was widely honored on its 20th anniversary.

Cultural Citizenship Theory and Praxis

Merging new understandings of subjectivity with the traditions of the Chicana/Chicano Movement, Rosaldo strove to develop collaborative dialogic relationships with both scholars and research participants, whom he conceptualized as thinking, strategizing subjects who had agency. Rosaldo was director of Stanford's Center for Chicano Research for almost 2 decades (1985–1990). During this time, he helped establish a multicentered Latino Cultural Studies Working Group that included Chicana/Chicano and Latina/Latino Studies Centers at several universities. The group developed a project on cultural citizenship, or the idea that legal citizenship in and of itself does not create subjects who are fully enfranchised and incorporated into civil society; instead, they evaluated a community's sense of membership and belonging within a society, as well as its ability to set its own agenda and have a different yet equally public presence and voice. Rosaldo contributed to a volume on *Latino Cultural Citizenship: Claiming Identity, Space, and Rights* (1997) and edited a volume titled *Cultural Citizenship in Island Southeast Asia* (2003), which were cited by scholars and activists in anthropology and many other fields.

In the vanguard of attempts to transform academic institutions and his own discipline, Rosaldo's praxis frequently led to confrontations, and Stanford's Department of Anthropology exemplified this discord. Often posited as a postmodern-versus-positivist battle, faculty at Stanford went through periods of great conflict during the mid-1980s and 1990s. Rosaldo assumed the position of department chair from 1994 until 1996, when he suffered a stroke in his office. Partially paralyzed on his right side after the stroke, he increasingly devoted attention to writing poetry and became an award-winning poet, winning, among others, the 2004 American Book Award for his bilingual book of poetry, *Prayer to Spider Woman/Rezo a la mujer araña* (2003). Merging his poetic and ethnographic voices, he refers to himself as an *anthropoeta*, or someone whose writing bridges the more sensual, evocative, emotional, and experiential world of poetry with the ethnographic and academic world of anthropology. In 2003, Rosaldo and Pratt left Stanford and took positions at New York University, where they continue to mentor students and collaborate in both their personal and academic lives. He became the inaugural director of Latino Studies, as well as the Lucie Stern Professor in the Social Sciences and professor of anthropology in the Department of Social and Cultural Analysis.

Rouch, Jean

The work of Jean Rouch (1917–2004), a French anthropologist, Africanist, and filmmaker, had a monumental impact on 20th-century anthropology and documentary filmmaking. At the time of his death, Rouch, whose work has earned him great international distinction, had produced more than 120 films.

On special occasions, such as the death of a notable person, the elders of the Songhay people of Niger and Mali like to recite the following proverb: "The blind mongoose never strays far from its home." Like the blind mongoose, Jean Rouch never strayed far from his homes: France and Niger. When he was well into his 80s, Rouch still traveled to Niger at least once a year. During his annual trip in 2004, Jean Rouch died in a tragic car accident. Although he had become a cultural icon in his native France, his wife decided that he should be buried in Niger, the site of most of his works in ethnography and film. His grave site is in the Catholic cemetery of Niamey, Niger's capital city.

When I traveled to Niamey in 2009, I went to the Catholic cemetery to find Jean Rouch's grave. The cemetery is a dry and dusty expanse of sand, concrete, and marble, just off the road to Kollo near Niamey's Terminus neighborhood. Most of the graves are desolate mounds of earth marked with wooden crosses in various states of decay. Rouch's grave, which had been dug in an isolated section of the cemetery, is covered with white marble squares and features a marble tombstone that reads, "Jean Rouch May 31, 1917–February 18, 2004"—a modest space that marks the passing of a great scholar and filmmaker.

My visit was on the fifth anniversary of Rouch's death. In the years since his passing, Jean Rouch's persona has reached mythic proportions in Niger. Niamey's French cultural center is named after him. In the cultural center's library, there is a collection of books by and about Rouch. A media center is being developed. In addition, *Le Caravan Jean Rouch*, sponsored by the cultural center, has taken Rouch's films to the isolated corners of the Nigerian countryside, where they were shot, in some cases, more than 60 years ago. Some of the villagers are the grandchildren of the people who appeared in those films.

During my trip to Niger, everyone talked about Jean Rouch in reverential tones, as if he, as a respected ancestor, was listening to all the talk about his life and work, as if he were making judgments about us down here on earth.

"Did you know him?" people would ask me in a whisper.

Life and Work

In 1917, Jean Rouch was born into a family of scientists and artists, a combination of perspectives that would give his work in ethnographic film its unique texture. During the 1930s, Rouch's maternal relatives—the artists—introduced him to the vibrant works and lives of the surrealists. Meanwhile, his father, a climatologist who sailed on exploratory voyages to Antarctica, encouraged his son to pursue the sciences. Rouch created a profound marriage of the scientific and artistic perspectives when he learned to build bridges as works of art at the famous French engineering school École Nationale des Ontes et Chaussees. In 1941, he was sent to the Colony of Niger to build roads and bridges. During one road project, lightning struck and killed a worker, and all work stopped. The workers were afraid of Dongo's (the Songhay spirit of thunder) retribution. Before work could start up again, the workers would have to make an offering to Dongo. In this way, Rouch saw his first spirit possession ceremony. The ceremony transformed him, thrusting the young engineer into the creative chaos of spirit possession, Songhay religion, and a life between Niger and France, between science and art, and between ethnography and film.

In 1944, Rouch, who had joined the Corps of Engineers of the Free French Army, returned to France. After the war, he began his formal anthropological study under the sponsorship of the famed French ethnographer Marcel Griuale. In 1946–1947, Rouch and two friends decided to journey, in catamarans and dugouts, the entire length of the Niger River. During this journey, Rouch brought a camera

to film the daily and ritual lives of the diverse peoples who lived along the banks of the majestic Niger. During one of the shoots, Rouch broke his tripod and had to shoot sequences with a hand-held camera—the birth of Rouch's documentary technique.

In 1947, Rouch became a researcher at France's National Research Center and began to conduct his doctoral research in anthropology among the Songhay people of west Niger and northeastern Mali. This period of research resulted in Rouch's doctoral dissertation, later published as two volumes, *Les Songhay* (The Songhay, 1954) and *Contribution a l'Histoire des Songhay* (Contribution to a History of the Songhay, 1953). Meanwhile, he began to produce some of his first documentary films: *Au pays des mages noirs* (In the Country of Wise Black Men, 1947), *Initiation a la danse de possedes* (Initiation to Possession Dance, 1949), *Les magiciens de Wanzerbe* (The Magicians of Wanzerbe, 1949), *Circoncision* (Cirumcision, 1949), and *Bataille sur le grande flueve* (Battle on the Great River, 1951). Each of these films documented the ritual life of the Songhay people (spirit possession ceremonies, magic rites, circumcision ceremonies, and the practice of hippopotamus hunting on the Niger River).

These early films are examples of the documentary realism of early ethnographic filmmaking. They attempt to document in a filmic language akin to scientific style the ritual and religious life of the Songhay of Niger and Mali. They exhibit none of the poetic flair of Rouch's later films, which, when they were first produced in the middle to late 1950s, established his international reputation in the worlds of both anthropology and film.

In 1954, Rouch began his long-term research on the migrations of the Sahelian peoples (the Songhay and Hausa from Niger, Bamana and Sonninke from Mali, and Mossi and Gurmantche from Burkina Faso) to the West African coast. His studies there resulted in one important book, *Migrations au Ghana* (Migrations to Ghana), and some of his most important films—the uniquely disturbing *Les maîtres fous* (The Crazy Masters, 1955), the incomparable *Moi, un noir* (Me, a Black Man, 1958), and the disquieting *La pyramide humaine* (The Human Pyramid, 1959).

These films were about the greatest issues of Rouch's time—war, colonialism, and racism. Rouch's confrontations with these issues in West Africa inspired him to seek new ways to understand and represent the complex forms of his social world. No matter what challenge he faced, Rouch was unafraid to take risks, to try something new, or to bear the consequences of his choices. When he found himself, as was often the case, at intellectual, artistic, or cultural crossroads, Rouch would often choose the less traveled path and say, "*Pourquoi pas?*" Why not try something different? This playfully deep creativity met the challenges of the complex social forms he attempted to describe and understand.

Rouch referred to these films produced in the 1950s as examples of "ethnofiction." Using data based on years of careful and rigorous ethnographic fieldwork, Rouch used film to tell stories that stretched the imagination, stories that compelled the viewer to think deeply about the existential issues—colonialism, war, and racism—that shaped an era of European-African political and social relations. The documentary texture of Rouch's ethnofiction films helped shape the documentary contours of the famous films of the French New Wave (François Truffaut's *The 400 Blows* and Jean-Luc Godard's *Breathless*, among others).

In 1960, Jean Rouch published his magisterial anthropological work *La religion et la magie Songhay* (Songhay Religion and Magic), a masterwork of ethnographic documentation, featuring a limited amount of authorial interpretation. Such a tack was the hallmark of Marcel Griaule's approach to ethnographic description. Following the publication of *La religion*, Rouch focused almost all his attention on creative approaches to filming social life. He did publish a few influential essays in the 1970s, however, notably "The Camera and the Man" (1974) and "On the Vicissitudes of the Self: The Possessed Dancer, the Magicians, the Sorcerer, the Filmmaker and the Ethnographer" (1971).

Following the production of his ethnofiction films, Rouch's work developed profound artistic and imaginative texture. Working always with his Nigerian partners, Damoure Zika, Lam Ibrahim Dia, and Tallou Mouzourane, Rouch found new and creative cinematic ways to represent an increasingly complex social reality. In 1960, using sound-synchronous filming, Rouch shot and produced *Chronique d'un été* (Chronicle of a Summer, 1960), a documentary film about the state of social life in France around 1960. *Chronique* was the first example of what Rouch called *cinéma vérité*.

Meanwhile, Rouch continued active collaboration with his Nigerian counterparts. This collaboration, which involved all aspects of shooting and production, resulted in the production of noteworthy films, *The Lion Hunters* (1965), *Jaguar* (1967), *Petit à Petit* (Little by Little, 1970), and *Les tambours d'avant: Tourou et bitti* (The Drums of the Past: Tourou and Bitti, 1971). Working with the same team as well as with his senior colleague Germaine Dieterlen, a specialist on the Dogon people of Mali, Rouch filmed the entire 7-year sequence of the *Sigui* ceremonies. With deep symbolism and pageantry, these seven works (1967–1974) document with great lyricism the origin story of the Dogon people, who developed one of the most complex and poetic cosmologies known in the anthropological record.

Jean Rouch used the camera to participate fully in the lives of the people he filmed, as well as to provoke them and, eventually, his audiences into imagining new dimensions of sociocultural experience. Many of his films of the 1960s cut to the flesh and blood of European colonialism, compelling us to reflect on our latent racism, our repressed sexuality, and the taken-for-granted assumptions of our intellectual heritage. They also highlight the significance of substantive collaboration, a research tactic that Rouch called "*anthropologie partagée*," in the construction of scholarly knowledge. Through these provocative films, Jean Rouch unveiled how relations of power shape our dreams, thoughts, and actions.

Rouch's example suggests that anthropologists and other scholars might need to adopt the medium of film/video to represent complex social forms faithfully. Rouch, after all, used film to evoke critically the painful presence of colonialism and racism. Yet the new media were insufficient means to reach this end. They certainly provided a wealth of representational possibilities, but for Rouch, they were no quick fix to the problem of representing complex social forms. If the new media were not the solution to the problem of representing complex social forms, what was one to do?

During a televised interview in 1980, Robert Gardner, the highly regarded and highly provocative documentary filmmaker, posed this question to Jean Rouch: "Jean Rouch, are you an anthropologist, or are you a filmmaker?" To which Rouch replied, "Well, anthropologists think I'm a filmmaker, and filmmakers think I am an anthropologist." He smiled at Gardner and said nothing further.

For Rouch, that boundary-defining question was beside the point. Just as the Songhay sorcerer lives in a space between the village and the bush, between the world of social life and the world of the spirits, so did Rouch live between France and West Africa, between ethnography and fiction, and between anthropology and film—a liminal figure par excellence. Rouch understood the creative power of the "between."

In his later years, Jean Rouch extended himself to a new generation of filmmakers and anthropologists. He tired quickly of aimless theorization. He always urged young filmmakers and anthropologists to tell good stories that evoke the issues of the day. The reason why Jean Rouch's work lives on is that in his major films, a master storyteller spins an unforgettable tale that reminds us viscerally what it means to live your life in ever-changing social worlds. As such, Rouch's body of more than 120 films is a monumental contribution of our comprehension of the human condition.

Rouch's complete bibliography and filmography can be accessed at the Comité de Film Ethnographique website: http://comitedufilmethnographique.com.

Rousseau, Jean-Jacques

Jean-Jacques Rousseau (1712–1778), whom Claude Lévi-Strauss considered the most anthropological of the philosophes, was one of the most important thinkers of the French Enlightenment. Born in Geneva, he left the city at the age of 16, maintaining

an ambivalent relationship with his birthplace throughout his life. Initially settling in Savoy in the French Alps, he eventually pursued his career in Paris as a musician and critic, writing articles on music for the *Encyclopédie* edited by Denis Diderot as well as composing an opera, *Le Devin de Village* (The Village Diviner), which was well received by King Louis XV. Turning from music to philosophy, he wrote passionately and prolifically for the rest of his life, condemning the political and economic injustices of a society that promoted inequality and, in the emotional, artistic, and spiritual realms, shamelessly promulgated artificiality rather than nature. Rousseau's polemics eventually led him to quarrel with virtually all the other leading philosophes of his generation, most notably Voltaire, Diderot, and David Hume. Nonetheless, he maintained a loyal following. After his death, many of his ideas found an echo in the French Revolution. His legacy remains controversial. Admirers see him as an early champion of freedom and equality, while his detractors accuse him of naively romanticizing the "noble savage" while justifying the excesses of revolutionary ideology.

The Discourses and the Origin of Languages

Rousseau's philosophical career was launched when he responded to a call by the Academy of Dijon in 1750 to write an essay about whether the reestablishment of the sciences and arts had contributed to the amelioration of morals. His prize-winning essay, published the following year, provocatively argued to the contrary that progress in the sciences and arts was accompanied by moral decay. He did not object to learning and culture per se but rather to the uses to which they were normally put. Most often, the sciences and arts served to implement, justify, or embellish the domination of the majority by the undeserving few. Responding to critics who alleged that savages might be vicious, Rousseau concurred but stipulated that ignorance was compatible with both good and evil but no society had yet combined learning and morality. Savagery was not necessarily noble, but civilization was intrinsically corrupt.

Four years later, in response to another challenge by the Academy of Dijon, he developed these ideas in far more detail in his *Discourse on Inequality*, one of his most important works. Rousseau begins by constructing an avowedly conjectural model of natural—which is to say radically asocial—humanity. Such humans live an entirely solitary existence, children leaving their mothers as soon as they are able to fend for themselves. Motivated solely by appetites for food and occasionally sex and by a fear of pain and hunger, they are not aggressive but on the contrary avoid contact with others, though, like animals, they feel a natural empathy for others in pain. Lacking language, they cannot transmit anything they might learn to the next generation. They are neither good nor evil, but lack any moral concepts whatsoever.

Rousseau's model was clearly intended as a rebuttal of the social contract theories of Hobbes and Locke. The rampant acquisitive desires that, for Hobbes, led to a state of nature characterized by the war of every man against every man are, Rousseau suggested, intrinsically social rather than natural. Of Locke's "natural" rights to life, liberty and property, Rousseau only acknowledged natural liberty. Rousseau's natural savages lacked the very concept of death, and consequently of life. As for property, Rousseau argued that its development in society was antithetical to natural liberty. It is unclear whether Rousseau believed that humans had ever existed in such a state of nature. His model has sometimes been construed as a sort of thought experiment, an attempt to imagine what humans would be like in the total absence of society or culture. But positing such a vision as the original state of humanity would have run afoul of religious authorities, either in France or Geneva, who insisted on the biblical account.

One way or the other, Rousseau argued that the idea of property was at the root of human inequality. Rousseau singled out the invention of metallurgy and agriculture as banes to human happiness, to the extent that they enabled the accumulation of property and the domination of the majority. He was convinced that savages were happier, and certainly more free, than his civilized contemporaries, though only at the price of ignorance if not stupidity. Yet he was also certain that there was no turning back and that the desires and habits inculcated by civilized society could not simply be shrugged off.

The *Discourse* includes a long footnote deploring the quality of descriptions generally found in the travel literature of his day. He complained that descriptions of non-Europeans were generally penned by sailors, soldiers, merchants, or missionaries—for

the most part, unqualified observers. He imagined descriptions written by philosophes, the likes of Diderot and the Comte de Montesquieu, combining careful observation with relative freedom from prejudice, and addressing critical philosophical concerns. Arguably, such a program foreshadowed the development of academic anthropology.

Rousseau had originally intended to include his ideas on the origin of language in the *Discourse on Inequality*, but the digression was so long that he decided to omit it, and it was only published posthumously as the *Essay on the Origin of Languages*. The scenario he imagined here was substantially different, with humans living in prelinguistic endogamous hordes, not unlike the 19th-century speculations of Johann Bachofen, John Ferguson McLennan, and Lewis Morgan about primal incest. Language arose when shepherds from one horde, smitten at the well with foreign shepherdesses, broke out in pure melody, the original and most expressive form of language. However, Rousseau made a further distinction between the southern lands of abundance and the harsher northern climates, where language arose in the inferior form of speech, as a plea for assistance rather than for love. More generally, the shift from melody to speech, from the expressive to the instrumental, was in Rousseau's eyes a sign of moral decline.

Later Writings

However much he deplored the moral consequences of material and intellectual progress, Rousseau was acutely aware of the impossibility of returning to any "natural" human condition. In his later work, he grappled with the question of how best to reconcile nature and society. *The Social Contract* (1762) begins with the famous outcry "Man is born free, but is everywhere in chains." Liberty and equality are the natural conditions of humanity, servitude and inequality their social predicaments. The book attempts to theorize the kind of society where humans can live freely and equally. Rousseau distinguishes between the particular wills of individuals, concerned with their specific interests, and the general will of society, focused on the common good. The general will emerges as a sort of sum total of the particular wills of an informed citizenry, with antithetical interests canceling each other out. As for many of his contemporaries, an idealized vision of the early Roman republic served as a model for such a government.

In the same year, he also published *Émile*, a long treatise on education. The book spells out a program for the moral and intellectual education of a boy from infancy to early adulthood, one that attempts to follow "natural" contours as much as possible while ultimately modeling a citizen. Both *The Social Contract* and *Émile* were rapidly condemned as subversive, not only in Paris but also in Geneva. Increasingly isolated, Rousseau grew to consider himself as the victim of a conspiracy. In his last years, he wrote *The Confessions*, which was published posthumously. The book was a remarkably novel kind of autobiography, a self-presentation in the form of a self-examination that sought to bring to light all the author's faults as well as his virtues rather than to portray him in the best possible light.

Influence

Along with Montesquieu, Rousseau was unquestionably the French Enlightenment thinker with the greatest impact on the social sciences in general and anthropology in particular.

Rousseau's work on the origin and development of social inequality set the agenda for subsequent attempts to grapple with the problem. He was certainly not the first to see the link between property and inequality, but his understanding of its technological roots, particularly through the development of agriculture and metallurgy, was echoed by Adam Smith and Adam Ferguson in Scotland. In the 19th century, Lewis Henry Morgan, Karl Marx, and Friedrich Engels were to develop this argument in far greater detail. Unlike the Scottish thinkers, Rousseau's prose was fervent if not incendiary. The central ideals of the French Revolution—liberty, equality, and fraternity—were explicitly meant to reflect Rousseau's thought. He profoundly influenced the 19th-century revolutionary thinkers, notably Marx and Engels, and through their writing various neo-Marxist currents in anthropology and other social sciences.

In a very different vein, Rousseau's attempts to theorize the essential nature of the social domain by attempting to distinguish "natural" from "social" aspects of humanity was an important influence on the thought of Émile Durkheim, who devoted a short book to *Émile*, Rousseau's treatise on education. Claude Lévi-Strauss, who was preoccupied in much of his writings with the relationship of nature to culture, was a great admirer of Rousseau. Rousseau's scenario in his *Essay on the Origin of Languages*

for the simultaneous emergence of language, music, and exogamy must certainly have appealed to, if not inspired, Lévi-Strauss. Jacques Derrida's seminal *Of Grammatology* also includes a long discussion of the same work.

Finally, Rousseau's *Confessions*, as a painfully honest attempt at a self-appraisal of his life and work, provided a blueprint for reflexive autobiography, a stark contrast to the self-promoting memoirs more typical of his era. Anthropologists who have used autobiography as a vehicle for critical reflection on their own and the discipline's practices of fieldwork and writing are following his example, even if they are not necessarily aware of their debt to Rousseau. However, his exploration of new modes of subjectivity as well as his passionate advocacy of liberty and equality and his philosophical speculations on nature, society, and culture have all in very different ways left their mark on contemporary anthropology.

Royal Anthropological Institute

The Royal Anthropological Institute (RAI) is one of the world's leading anthropological foundations. It has its roots in the early 19th century but took its characteristic modern shape in 1871, when the Anthropological Institute was formed out of the Anthropological and the Ethnological Societies of London. It was granted a Royal Charter in 1907. Though it has changed buildings repeatedly throughout its history, only obtaining a freehold as late as the 1980s, the institute's intellectual orientation and organizing principles have remained remarkably consistent. Albeit with a strong underlying emphasis on ethnography, the RAI is devoted to the study of anthropology in its broadest sense, embracing social anthropology, archaeology, biological anthropology, and any other subthemes that may become relevant, such as linguistic anthropology or material culture. This approach stands in marked contrast to the fractionization of anthropology in British universities after World War I, when social anthropology separated off markedly from both archaeology and biological anthropology.

The explanation of this readiness to retain a holistic interpretation is partly a reflection of the era when the institute was founded. The conception of anthropology at that time was both comparative and historical. The study of humankind's diversity and the study of archaeology therefore coincided in that both were traceable through a series of developing stages. The emergence of evolutionary theory provided a perfect way of unifying this diversity, as was clearly stated by Robert Marett, for example, in his characteristically robust *Anthropology*, published for the first time in 1912. This intellectual sense of unity received its expression in the institute's publications, of which the *Journal of the Royal Anthropological Institute* (*JRAI*) is the most long-lived. Just about every British anthropologist of significance published at least some of their work in the *JRAI*, because of which it has become the journal of record for the discipline in the United Kingdom, a role that it partly retains even in today's much more diverse publications environment.

The RAI for much of its existence has also awarded the prestigious Huxley Medal, regarded as one of the most important accolades in an anthropologist's career. The Huxley Memorial Lecture has featured not just the most well-known names in Britain but also international thinkers of diverse background: James G. Frazer, Alfred C. Haddon, W. H. R. Rivers, Pierre Bourdieu, Marcel Mauss, Claude Lévi-Strauss, V. Gordon Childe, Ian Hodder, Clifford Geertz, Lewis Binford, Colin Renfrew, and Marshal Sahlins, among many others. It awards additionally the Rivers, Wellcome, and Lucy Mair

medals for fieldwork, medical anthropology, and applied anthropology, respectively.

Though it took shape in earlier times, further explanation of the RAI's longevity may lie in the way the institute is organized. It was and is independent. This means that it has never been caught up directly in the intellectual politics of any other institution or those of government. Additionally, there is no intellectual barrier or required qualification to join as a fellow, which means that no groups of people have become gatekeepers, and hence protective of a disciplinary line that excludes others. The council of the institute is elected—with some form of rotation enforced by statute, meaning that it changes every year—and is responsible to the fellows at the annual general meeting.

This does not mean that there have never been interest groups within the RAI. It was a sense of frustration with the dominance of the evolutionary model that led to fellows separating and forming the Association of Social Anthropologists in the period after World War II. The rise of social anthropology over the next 4 decades had an impact on those who published in the *JRAI* and who became most active as fellows. This, though, has never been enshrined in the organizational characteristics of the institution. By virtue of the changing and fluid membership of both the fellowship and the council, it is possible to regain or rejuvenate without structural upheaval a broad-based conception of the discipline, should it be perceived that one or another disciplinary line is becoming dominant. Furthermore, the loose yet long-term commitment that many fellows have to the institute over decades means that interests have a habit of coming round again, even if they have gone quiet for a while.

This wide reach and flexible organization has meant that the RAI has been able to devote working parties or committees to a number of distinct problems as they emerge; and here, its intellectual influence has often been very marked. For instance, one of the most read of all publications has been *Notes and Queries in Anthropology*, which appeared in the 19th century and ran in various editions until 1951. It outlines the way in which fieldwork should be conducted—in the form of a series of extended questions—and was printed in large numbers. Though conceived in its earlier forms through Section H of the British Association for the Advancement of Science, it gradually began to become shaped by the leading fellows of the RAI, many of whom were active in both organizations. This kind of codification has declined markedly in popularity as the more free-searching interpretation of anthropology has come to the fore, but it played a distinct part in the dense ethnographic triumphs that were part of the modern school that finally crystallized under Malinowski. Curiously, there is nothing today that is quite its equivalent, though archaeology has independently developed a codification of its methods through the Institute of Field Archaeologists.

This same urge to place anthropology on a sound methodological basis was partly the inspiration for a long initiative led by Sir John Linton Myres in the years leading up to the First World War. Myres was a classicist and historian of great energy and interested in anthropology; he was successively honorary secretary, president, and founding editor of *Man*—a popular version of the *JRAI*. In the course of his long career at the institute, Myres wished to attempt an internationally approved scientific clarification of the way in which anthropological research should be conducted. His meticulous preparations to hold an international congress that would draw in the European nations, Russia, and the United States to discuss these issues was hampered by the outbreak of war. But the initiative that he began was finally successful when it resulted in a large international congress held in London in 1934. The congress then subsequently transformed itself to become the International Union for Ethnographic and Anthropological Sciences. The International Union for Ethnographic and Anthropological Sciences remains prominent, meeting in China in 2009 and in Manchester in 2013. The story of Myres's role is still not fully told. It is worth noting, however, that he was assiduous in enquiring as to whether the proposed congress should be purely ethnographic or should also include physical anthropology, and the institute took an express decision to retain its broad base.

Before the Second World War, a further initiative was started at a time when the RAI was particularly short of funds. This was an attempt to apply the principles of fieldwork to industrial anthropology, with a view to solving problems in the workplace, sponsored in part by Israel Sieff (of the British department store chain Marks & Spencer). Though this was not as successful as the institute had initially hoped, the Lucy Mair Medal continues to recall the

importance of applied anthropology, and the institute in 2012 held a large conference at the British Museum titled "Anthropology in the World" to reinvestigate its dialogue with applied anthropology and related fields.

After the war, the institute went through a difficult period. The ending of the lease of its building in Bedford Square and the perennial financial difficulties all played a part in this. However, after a careful review, it obtained a freehold (its present premises) in Fitzroy Street, donated its library to the British Museum, and self-consciously sought to think where it might most actively make a contribution. From this introspection emerged one of its most successful projects, ethnographic film. The institute now holds a regular, biannual international film festival, and its film committee contains a host of well-known figures who are active filmmakers.

Just before this initiative was another that met with equal success at its outset: The institute formed a committee for ethnomusicology, which drew together international experts in the field in an attempt to create a critical mass that could suggest a codification for ethnomusicological research and seek its appropriate recognition more widely. The University Grants Committee of that time was persuaded, and accordingly posts were set up, notably at Belfast under the leadership of John Blacking. Ethnomusicology in the United Kingdom has subsequently rather lessened in importance in anthropology departments, though it has flourished in other spheres. The untimely demise of this guiding committee (which the RAI council in 2012 decided to reconstitute) is perhaps one of the reasons why.

The formation of a committee devoted to the place of anthropology in preuniversity education is another striking example of how devoting specific resources to a problem through the organization of expert groups can be effective. First thought of by the RAI in the 1970s, the idea was revisited in the new millennium to good effect, and after a long sequence of meetings, an Examination Board agreed to take on the subject for A level (the main U.K. school-leaving qualification). Again, as in so many RAI projects, the A-level curriculum is devoted to a broad conception of anthropology as a discipline that draws in material culture, biological anthropology, as well as social anthropology.

In sum, today the immense growth of universities, the multiplicity of departments, and the more recent emergence of alternative forums for intellectual discussion mean that the RAI has to be flexible as to which aspect of anthropology it pursues and must accept that it can only be one part of an overall matrix of anthropological thought. Any dominant role that the RAI once held, when anthropological ideas were discussed most intensively at its premises, perhaps more than anywhere else in the country, has waned. This fact means that occasionally questions have been asked as to whether the time has passed for such institutions. These doubts, if they were ever seriously held, have quickly been shown to be erroneous.

The RAI has moved from being a 19th-century to a 21st-century learned society almost unscathed. The fellowship is buoyant, and its lectures and special events are well attended. Its publications are bought by just about every large university library in the world, and to be voted to serve on the RAI's council is regarded an honor by many. Yet, more than this, it would appear that there is a desire, a need on the part of those interested in anthropology, whether possessed of a university post or not, to have a place where they can meet to talk, discuss, and present events without constraint. The institute can accordingly act swiftly and decisively. Unencumbered by bureaucracy, the RAI retains a sense of being a group of like-minded intellectuals coming together by free association. It is to this that it owes much of its effectiveness and continued popularity.

S

Sacrifice

Since the late 19th century, anthropological theories of sacrifice have shaped interdisciplinary scholarship on this ambiguous and powerfully fraught word. Symptomatic of this ambiguity, the original 1987 entry for sacrifice in the *Encyclopedia of Religion* begins with etymologies of the Latin term (*sacer*, "holy"; *facere*, "to make"), moving back and forth between its Latinate and Germanic (formal and vernacular) connotations as either a personal religious "offering" or, more generally, an action "to perform, [to] accomplish" something sacred. After explaining how the word tends to, but should not have to, imply destruction, the metaphorical identification of sacrifice with ritual slaying is elaborated in 26 headings and subheadings that catalog its world-historical traditions. The second edition (2004) contained a postscript by the historian of Aztec religion David Carrasco, noting that recent work on sacrifice deals increasingly with the "ubiquity, tenacity, and mystery of ritual violence and its creative and destructive powers"—a particularly important task for 21st-century scholarship confronting nationalist forms of discrimination and open calls for a "War on Terror."

Sacrifice has been studied in the humanities and social sciences from its origin(s) in collective religious beliefs and ritual processes to the modern governmental practice of marshaling civil society toward the goals of the state. Unquestionably, sacrifice matters. Its very language is part and parcel of modern philosophical systems—but it is also a vitally popular keyword, the way countless people talk about their ideals and collective fantasies, their personal troubles and ideological attachments.

Anthropological theory opens a distinctive mode of critical thinking about actual sacrificial practices—practices that typically enshroud the meaning of political and religious events, with often shocking indifference to persecution, suffering, and victimhood. Across this literature, sacrifice can be defined as follows: (a) the domain in which the supernatural materializes, lying at the intersection between the religious and political worlds; (b) how scholars make sense of propositional claims about systems of belief and, by extension, the projection of an imperial order; and (c) a set of practices that scholars use to reimagine today's most pressing geopolitical issues, using theological concepts reformulated by secular intellectuals in disciplines as wide-ranging as anthropology, sociology, and religious studies.

Most notably, scholars from James G. Frazer to Sigmund Freud, or from Bruce Lincoln to Claudio Lomnitz—dating from the origins of social theory forward—have viewed sacrifice as critically integral to state law and to the forms of violence underwriting it. Ritual and ethical sacrifice both demand materially separating and destroying something's presence (i.e., making something "exceptional") and then remaking one's world in the spirit of such an offering. Frazer, in *The Golden Bough* (1911–1915), famously asserted that sacrifice plays a key role in the Western logic of kingship and the powerful myth of exercising complete, worldly dominion over matters of life and death. From a Frazerian perspective, however, the power of divine kingship cuts both ways; if a ruler does not prove worthy of

his rule, he can be ritually murdered—made into an exception—from one season to the next. Taking the agencies of ruler *and* ruled into account, many 20th-century anthropologists, such as Valerio Valeri in his historical ethnography of Hawaiian sacrifice, ask how indigenous systems of sacred kingship operated at the moment of first contact with European colonists. In recent decades, heated anthropological debates, such as that between Marshall Sahlins and Gananath Obeyesekere, have turned on whether indigenous belief in divine kingship could help reconstruct historical events, such as the ritual sacrifice/murder of Captain James Cook (at the hands of native Hawaiians, who arguably had venerated him as their mythical God-king, *Lono*), or whether such ascriptions of ritual sacrifice are merely projections of Western fantasies about indigenous psychology and the exoticizing logic of colonial rule.

The study of sacrifice has been pushed in still other directions in constitutional democracies, where "the people" nominally exercise sovereign rule. As John Borneman noted in a 2002 essay, democratic elections that arrogate to citizens the cyclical power to remove their heads of state from office reflect, albeit in a peaceable way, Frazer's mytho-historical understanding of king sacrifice. In such contexts, citizens are told that whomever or whatever one happens to sacrifice, it ought to be a critically important personal *choice*, with different constituencies coming together in alliance around the core values of one's society. This sacrificial logic can be seen at work across lofty rhetoric, such as the nation's sacrifice and veneration of unknown fallen soldiers (see Benedict Anderson's *Imagined Communities*), or even in the way President George W. Bush urged citizens to go shopping to stimulate the national economy, as a response to the 9/11 terror attacks—patriotic neoliberalism in the service of strengthening his military-industrial command. Although these examples may seem incongruous, they both relate to the expectation that sacrifice is an individual ethical activity, fostering a productive sense of collective sovereignty. In other contexts, Parvis Ghassem-Fachandi shows this perverse logic to be operative in the Indian case of Hindu nationalist pogroms against Muslims, and Lomnitz likewise reveals how the Mexican state rhetoric about the financial "crisis" allows certain political constituencies to make the less powerful carry a heavier burden of economic austerity or to systematically undermine their political interests.

The promise of a choice to participate in sacrificial phenomena can be said to be democratic, but optional participation is also held out to domesticate and naturalize ritual violence—as René Girard argues in various books—as if such voluntarism were the product of the democratic will and not broader structural forces. Anthropologists such as Maurice Bloch explore what actually happens, in places such as Orokaiva, Papua New Guinea, when you are obligatorily recruited into the vital world of a community's ritual forms of reproduction, particularly when necessary change in society, such as a younger generation reaching political maturity, is rendered impossible without some kind of ritualized disturbance—that is, when one's identity shifts, in Bloch's own words, "from prey to hunter." While Frazerian theories may concern themselves with political leaders, another strain of theory of sacrifice deals more properly with the way consecration and victimhood operate structurally to inform social processes.

In their 1898 book *Sacrifice: Its Nature and Functions*, Henri Hubert and Marcel Mauss denominated the nature and function of sacrifice, a system of religious experience based on a symbolic yet destructive rite. Sacrifice, for them, was a religious act that, in the process of consecrating a victim, "modifies the condition of the moral person" who performs the act of consecration or modifies "certain objects with which he is concerned"—a broad-based definition of efficacious ritual communication, transformation, and solidarity. More than half a century later, E. E. Evans-Pritchard wrote a foreword to the first English translation of Hubert and Mauss's by then internationally classic text, introducing the prospect of sacrifice as a "fundamental rite" of social order. Most ethnographers and critics who delve into questions of sacrifice today interrogate these great anthropologists' works. Susan Mizruchi and other critics have claimed more recently that the concept of sacrifice emerged out of distinctly historical European American social scientific inquiry in the service of capitalist imperial expansion. However, doing so would isolate academic knowledge as a mere symptom of Orientalist fantasies and would ignore the democratization of claims about sacrifice and its influence on secular statehood and national belonging—problems that, as Ivan Strenski shows

in his 2002 book *Contesting Sacrifice*, are as central today as they were in the late 19th century.

Indeed, fin de siècle treatments of sacrifice such as Frazer's and Hubert and Mauss's remain surprisingly prescient today. They illuminate the ritual orders that make sense of imperial rule, the impact of scapegoating on the creation of pariah populations, or the dovetailing religious and political implications of sovereign rule. When the Italian philosopher Giorgio Agamben claims in his laudable *Homo Sacer* (The Sacred Man) monographs, for example, that any historical definition of the political lies with the power to determine who can be killed without being sacrificed, he builds directly on the way early anthropologists adapted concepts drawn from theology to understand secular problems of societal reproduction. Works of intellectual history such as Strenski's *Contesting Sacrifice: Religion, Nationalism, and Social Thought in France* (2002) demonstrate the centrality of laying claim to victimhood and collective revitalization in tumultuous periods of state history. In the past quarter-century, feminist theorists such as Nancy Jay have critiqued how sacred violence in the service of patriarchal authority was the central problem analyzed by early theoretical approaches to sacrifice, concerned as they were with paradigmatically masculine questions of kingship and victimhood, blood lineage and outsidership. Erica Weiss, Jill Robbins, Stephanie Jamison, Kathryn McClymond, and others similarly explore the hidden, nonreductivist dimensions of intellectual questions about sacrifice's phenomenology or its ritual ordering within the state—a key hermeneutical movement examining religious, ethnoracial, gendered, and generational difference. It is as if in critiquing sacred violence—including its intellectual history—contemporary theorists of sacrifice analyze the legacy of an unbroken tradition of secular inquiry going back to the late 19th century and the ever-fraught character of the modern state form.

Sahlins, Marshall

Marshall Sahlins (1930–) is one of the most important anthropologists of the second half of the 20th century, an expert in Polynesian ethnology, and an advocate of culture as a central concept, first in economic anthropology (in the early part of his career) and then in historical anthropology (in the later part of his career).

Biography and Major Works

Sahlins was raised on the west side of Chicago and came of age during World War II. A lifelong sports fan and athlete, he chose to attend the University of Michigan based on the quality of its football team. There, Sahlins became a protegé of Leslie White, a maverick thinker who opposed mainstream Boasian anthropology. For Boas, anthropology was the in-depth study of particular cultures, and he spurned theories of societal evolution and generalizing approaches to social science because of their inaccuracy and connection to racism and eugenics. White, in contrast, was influenced by Lewis Henry Morgan and Herbert Spencer and argued for a generalizing, scientific study of culture. White enjoyed denouncing the religious pieties of the American Midwest as unevolved, and he was also involved in radical socialist politics. Sahlins was to inherit White's contrarianism, his skepticism about America's self-confidence, and his interest in generalizing approaches.

After Sahlins earned his BA and MA under White, he moved to New York to earn a doctorate at Columbia. There, he was influenced by a generation of young faculty and graduate students who were themselves influenced by Julian Steward. This included Robert Murphy, Sidney Mintz, Eric Wolf, Marvin Harris, and Morton Fried, who supervised Sahlins's dissertation. These scholars combined Steward's cultural ecology with their own leftist sympathies to produce a Marxist anthropology. Sahlins was also influenced by the Hungarian emigré Karl Polanyi, one of the many scholars who fled Europe during World War II. Polanyi, an economist and historian, argued that capitalism was a culturally specific phenomenon that was ultimately pathological. In his dissertation, *Social Stratification in Polynesia*, Sahlins combined the ideas of Polanyi, White, and Steward to argue that Polynesian cultures took the form they did because of their adaption to their different island homes. The dissertation was a triumph both for its theoretical sophistication and for its astonishing ethnographic synthesis.

As he came of age intellectually, Sahlins's school of thought moved from the margins of anthropology to its center. Sahlins returned to teach at the University of Michigan, where a leftist, evolutionary economic anthropology flourished under a new cadre of professors, including Elman Service, Thomas Harding, Eric Wolf, Raymond Kelly, and Roy Rappaport. Sahlins produced an ethnography of Fiji based on fieldwork, *Moala*, as well as a volume on evolution, *Evolution and Culture*, which he edited with Service and Harding. He also became active in the antiwar movement, writing against Vietnam and organizing the first teach-ins.

In the mid-1960s, Sahlins embarked on a series of trips that decisively shaped the course of his career. He spent 2 years as a visiting professor in France and was exposed to Claude Lévi-Strauss's structuralism as well as student activism in May 1968. He also traveled to Australia, where he encountered the first generation of Pacific historians, such as Greg Denning and Henry Maude. In 1973, he published *Stone Age Economics*, a series of essays in the Polanyi-White tradition. The most important essay in the book was "The Original Affluent Society," in which he argued that hunter-gatherers live simple lives because they are not driven by the West's culturally specific need to amass endless wealth. It became his most well-known piece.

In 1972, Sahlins took a position at the University of Chicago, where he taught until his retirement in the late 1990s. At Chicago, Sahlins shifted direction. White had argued that culture was a unique causal force in history and that it was determined by the environment. Both could not be true. Moreover, evolutionary anthropology focused narrowly on the environment and never explained how societies adapted to one another. In 1976, Sahlins wrote *Culture and Practical Reason*, which emphasized that culture was an independent force that interacted with, but was not determined by, the environment.

In 1985, Sahlins published *Islands of History*. Here, he presented his famous theory of the "structure of the conjuncture" (described later in the entry). His exemplary case was the death of the British naval officer Captain James Cook in Hawaii in the 18th century. Sahlins's theoretical sophistication made him one of the foremost thinkers of the decade because he demonstrated how a structural approach could be reconciled with a focus on the reality of "practice," or action on the ground. *Islands of History* also drew criticism. Most notably, Gananath Obeyesekere criticized Sahlins for drawing on Western stereotypes to depict the Hawaiians. The result was the "Sahlins-Obeyesekere debate," which became famous because it epitomized the different ways anthropologists responded to postcolonial criticisms popular in the 1990s. Ultimately, the debate boiled down to how best to respect indigenous Hawaiians—by emphasizing their similarity with other humans or by respecting their cultural difference. Unusually, it was Sahlins, the "old White man," who emphasized difference and alterity, while Obeyesekere argued in favor of a more Western-style universalism. Over time, the debate fizzled out, and Sahlins is generally considered to have won on points.

As the 1980s turned into the 1990s, Sahlins focused on defending anthropology from postmodern and postcolonial criticisms. In texts like *Waiting for Foucault*, Sahlins mocked these trends and emphasized that social life could be explained clearly even if it was complex. In addition, he published a series of papers arguing against the idea that indigenous culture was dying out. Rather, he claimed, indigenous cultures are resilient and vibrant and co-opt Western culture for their own ends. In the 1970s, he argued that capitalism was a culturally

specific project. Now, he argued that capitalism's impact was mediated by the cultures exposed to it.

The events of 9/11 galvanized Sahlins to return to a more politicized anthropology. He became more politically active, writing articles critical of the American regime in Iraq. He argued that disorder and civil war in the Middle East were not the result of ancient primordial ethnic and religious tensions, nor were they the result of some raw, aggressive human nature unleashed by the end of governmental rule. Rather, American imperialism had induced a crisis in the region, which led to the troubles common in that region. He also revisited his theories of the role of individual agency—no doubt with an eye on George W. Bush—in making history. The result was the book *Apologies to Thucydides*, which traces the roots of America's foreign policy to the realpolitik of Thucydides. The book is an extended comparison of the Peloponnesian war with a conflict in 19th-century Fiji. The best part of this book, however, is the sparkling middle section, in which Sahlins examines the role of structure and agency in the Elian Gonzales affair. Gonzales was a Cuban orphan who was rescued at sea, where his mother drowned in an attempt to emigrate to the United States. He was brought to live with his relatives in Florida against the wishes of his father in Cuba but was eventually repatriated. Sahlins demonstrated how the story of Elian's family became national news because of the way it engaged numerous larger cultural structures, such as U.S.-Cuba antagonism, Catholic interest in miraculous rescues, and the importance of Florida's Cuban demographic in the upcoming national election.

In the first decade of the 21st century, Sahlins continued to elaborate a "political anthropology of the marvelous," which emphasized the role of culture in politics. In particular, he argued that the worldwide distribution of stranger kingship (political systems where the ruler is not from one's ethnic group) indicated a universal human propensity to search for sources of power and fertility outside one's own group. He further argued that exogamy was the paradigmatic form of this search. In his most recent book, *What Kinship Is . . . And Is Not*, Sahlins revisits some of the oldest themes in his work and makes daring and wide-ranging claims about human nature—a fitting move in the career of a long-lived scholar who continues to publish actively to this day.

Critical Contributions

Sahlins's work ranges across several continents and a few centuries. However, beneath this variety of topics, there are a few common themes that are at work in his writings.

Culture as a Sui Generis Force

Sahlins has consistently put the culture concept at the center of anthropology. For him, culture is a sui generis force or "unique order of determination." This means that although culture shapes and is shaped by other factors, such as biology and geography, it is ultimately a unique and real phenomenon that cannot be reduced to any other, more primary force. Just as life is an emergent force that is greater than the sum of its parts, so too is culture. Indeed, for Sahlins, anthropology is a distinct discipline not because of its unique viewpoint or methods but because it has a unique subject matter: culture. For Sahlins, *culture* refers to arbitrary and conventional systems of meaning. In practice, these systems are applied in a variety of ways. Although the results may appear contradictory and disorderly, this does not mean that the basic structure beneath them is disorderly. Rather, the differences of meaning, viewpoint, or classification are themselves systematic and can be viewed as transformations of underlying, more orderly structures.

Many anthropologists prior to Sahlins inherited a distinction between materialism and idealism that dated back to Georg W. F. Hegel (or, perhaps, Plato). Sahlins explicitly formulated the culture concept to avoid this dualism. For him, culture can be both physical and meaningful, existing as much in cultivated landscapes or made objects as it does in the realm of cognitive meaning or intersubjective understanding. Human action is, for Sahlins, always cultural, even if it is also physical or serves utilitarian goals. Thus, for instance, he writes that cannibalism is always "symbolic" even when it is "real"—something that carried symbolic importance as well as nutritional value.

Structure of the Conjuncture

Sahlins claims that culture both shapes and is shaped by other factors, such as biology and geography. To clarify how these different forces interact with one another, Sahlins developed the concept of

the "structure of the conjuncture." He argues that societies were shaped by the complex conjuncture (intersection) of a variety of forces (structures). Sahlins intended this model to replace earlier, evolutionary ones that claimed that culture was always shaped by the need to adapt to the natural environment. Rather, he claims, multiple causal forces react with each other. An important part of this claim is that individuals have the agency to make history based on their position in a cultural structure. Sahlins distinguishes between "systemic agency" and "conjunctural agency." Sometimes structures amplify the agency of certain people because of their position in a system of power and authority—Fijian chiefs, for instance, can make decisions that can change the course of history. At other times, it is the structure of the conjuncture, a fortuitous arrangement of circumstances, that allows people to make history. Sahlins uses Bobby Thomson's game-winning home run in 1951 as an example of this latter sort of agency. Any player of a baseball team may be the one to hit (or miss) the pitch that could win them the game, despite the fact that he is no more special than any of the other players on the team. A benefit of Sahlins's model, then, is that it recognizes human agency even as it acknowledges the way agency is shaped by other forces.

Sahlins argues that conjunctures are so complex and driven by circumstance and chance that one cannot develop a generalized science of them in which distinct causal forces are enumerated and their interaction tested. Understanding why a society has the shape and form it currently has requires a historical explanation of the contingent history that produced it. Only through a corpus of such histories can we begin to make some generalizations about how human cultures function as a whole. In this respect, Sahlins's work ultimately resembles that of Max Weber.

Cultural Determination of Behavior

Throughout his career, Sahlins has argued that culture shapes human social life in a fundamental way. In the famous "formalist" versus "substantivist" debate in economic anthropology in the 1970s, Sahlins was the chief proponent of substantivism. Like all substantivists, he insisted that economic life—the provisioning of food, shelter, and other needs—was made on the basis of cultural rules regarding the production and distribution of goods. Thus, it was wrong to assume, as economists sometimes do, that society is best viewed as a collection of utility-maximizing individuals. Understanding economic life, therefore, requires understanding the institutions that shape it, rather than seeing it as a by-product of multiple individual choices.

Sahlins has also made the same argument in the realm of politics. The doctrine of "realism" in political science sees conflict as driven by competitive self-interest. In contrast, Sahlins argues that politics involves the achievement of culturally specific ends using culturally specific means. The orchestration of lethal force, such as firing squads, requires a process of socialization in which soldiers are taught that it is culturally normal to fire when ready. Even cases that appear to most closely approximate Hobbes's state of nature—Iraq after the American invasion, for instance—are the result of massive, organized, and culturally driven interventions in local states of affairs. As Sahlins remarked, it takes a lot of culture to make a state of nature.

The same is true with regard to basic biological processes too. Authors such as Steven Pinker, David Buss, and Robert Wright have argued that there is an innate, relatively substantial, human nature and that culture is merely the window dressing, which does little to shape human lives. Sahlins argues the opposite. In the case of sexual desire, for instance, kinship systems organize sexuality and human reproduction, rather than the other way around. Racial categories are not an impingement of natural biological difference on our consciousness. Rather, to the extent that race has any sort of biological reality at all, it is because race is the organization of biology by culture, since cultural norms shape marriage choices and thus ultimately the biological constitution of individuals.

Criticism of Western Theories of Human Nature

Throughout his career, Sahlins has argued that the findings of anthropology are opposed to much of Western common sense, and in particular to Western social theory. In particular, Sahlins has consistently argued against the influence of Thomas Hobbes in Western thought. Hobbes argued that society was composed of appetitive, desiring individuals. In contrast, Sahlins argues that biologically given desires are very general and only take the specific

form they do because of the way in which culture shapes biology. We are not desiring individuals, he argues, but members of a community with culturally distinct forms of reciprocity. For Sahlins, in other words, it is not altruism that needs to be explained but the West's culturally distinctive belief that greed is natural. Sahlins has criticized the Hobbesian strain of social thought wherever he has found it. In his 1976 book *The Use and Abuse of Sociobiology,* Sahlins argues that sociobiology uses a theory of nature similar to Hobbes's. He has made a similar move in his criticism of "formalist" approaches to the economy and his criticisms of the field of economics as a whole. The idea that individuals pursue their own biologically given ends, he argues, underlies American individualism and consumer culture. In the realm of politics, Sahlins has traced Hobbes's viewpoint back to Thucydides (who influenced Hobbes) and argued that it is Herodotus, the proto-ethnographer, rather than Thucydides, the proto-political scientist, whom we ought to revere. At its broadest level, Sahlins's polemic has encompassed the entire tradition of Western philosophy, which he has criticized in works such as his 2008 pamphlet *The Western Illusion of Human Nature.*

Legacy

Sahlins has had a deep and enduring legacy in anthropology, becoming (with Clifford Geertz) the most well-known anthropologist of the post–World War II period. In the 1960s, he was one of the key figures who produced the neo-evolutionary approach in anthropology. In the 1970s, he was key in the development of economic anthropology. In the 1980s, his work on the structure of the conjuncture became one of the key paradigms for understanding the interaction of culture and agency. At the same time, he also became one of the first people to develop historical anthropology, a subdiscipline that flourished during that same decade.

Beyond this broad, discipline-wide influence, Sahlins has also been key to the development of a variety of other groups of scholars. Pacificists, whether they study Polynesia, Micronesia, or Melanesia, have looked to Sahlins's work for well over half a century. In addition, Sahlins has influenced Pacific Island scholars. For instance, the Tongan anthropologist and novelist Epeli Hau'ofa credits Sahlins with influencing his seminal essay "Our Sea of Islands." In Hawaii, Sahlins worked with the Hawaiian scholar Lilikala Kame'eleihiwa (who is now critical of his Hawaiian ethnography). Sahlins has also been a central part of the network connecting Anglophone and Francophone scholars. Sahlins is a recipient of the Chevalier des Arts et des Lettres from the French Ministry of Culture (a sort of French knighthood), and his books continue to be read and discussed in that country and in Europe more broadly.

Sahlins will also be remembered for his political activism. During the Vietnam War, he was one of the developers of the teach-in and opposed government projects that would use social science knowledge in the service of imperialism. After 9/11, Sahlins was active in politics again, arguing against American involvement in the Middle East. In particular, he opposed anthropologists who collaborated with the U.S. government. Sahlins's activism has also extended to the area of copyright reform and open access: As the editor-in-chief of Prickly Paradigm Press, he has issued pamphlets under a creative commons license, and he has encouraged open-access journals such as *Hau.*

Although Sahlins's influence is wide, it is also diffuse. Sahlins has never encouraged devotees, and there is no "Sahlinsian" school of thought. As a result, his students have stood out for the way they have transformed, not reproduced, his thought. As he continues to write and publish in a career that has stretched more than 5 decades, Sahlins produces new works that will leave a legacy whose scope and power are still waiting to be determined.

Said, Edward

Edward Said (1935–2003) was a Palestinian American professor of English and comparative literature at Columbia University. Said's work is a very prominent example of how literature advances anthropology by fostering the development of its theories, critiquing anthropological insights and practices, and calling on anthropologists to reflect on the effect of their work on the people they investigate. Said's book *Orientalism* was the initial impulse for postcolonial studies. This entry gives short biographical notes, retraces the main issues of Said's work, and discusses its influences on prominent theoretical scholars of difference (construction) and otherness.

Biographical Notes

Said was born as Edward Wadie Saïd on November 1, 1935, in Jerusalem in the British Mandate of Palestine. His parents were Christian Palestinians practicing the Greek Orthodox rite. In World War I, his father served in the U.S. Army, and both he and his family became U.S. citizens. The household language was English. The family moved several times between Jerusalem, Cairo, and Beirut. Said received his elementary education in Jerusalem and his higher education in the Egyptian branch of Victoria College in Cairo, an institution known for recruiting local students and preparing them for (post)colonial duty in the government and administration of the newly independent Arab nation-states. In 1951, after Said was expelled from Victoria College for bad behavior, his family sent him to the United States, where he studied English literature and history and received his Bachelor of Arts degree at Princeton University in 1957. He received his Master of Arts degree and his PhD at Harvard University in 1960 and 1964, respectively. In 1963, he accepted a position at Columbia University, where he taught English and comparative literature until his death in 2003.

Alongside his academic career, Said was engaged in the political process in the Levant and was an inveterate foe of Israel for a long time. He compared the Levantine situation with South Africa's apartheid regime. After a long period of being totally nonpolitical, agnostic, and not defining himself as Arab or Palestinian, his political consciousness awoke after the victory of Israeli forces in the Six-Day War in 1967 and the following occupation of Palestinian territory. These events also spurred him to write *Orientalism*. Since the publication in 1968 of his first political article, "The Arab Portrayed," he was considered the voice of Palestine in the United States and Arafat's man in New York. In 1977, he was elected to a permanent position as a member of the Palestinian National Council, and he established the first contacts between the Palestine Liberation Organization and the U.S. government. In 1991, he broke with the Palestine Liberation Organization, left the Palestinian National Council, and became one of the harshest critics of Palestine Liberation Organization politics and of Arafat, accusing both of corruption. As a consequence of the 1993 Oslo I Peace Accord, Said began to change his opinion about Israel and its actions. In 1999, with the Jewish conductor Daniel Barenboim, he established the West-Eastern Divan Orchestra, a youth orchestra based in Seville, Spain, to boost the reconciliation process between Jews and Arabs. Edward Said died of leukemia on September 25, 2003, in New York.

Work

Orientalism

Said's most influential book, *Orientalism*, resulted from his personal experiences as a member of a Christian minority in the Jewish- and Muslim-dominated Middle East and as a refugee in the Western world after the occupation of Palestinian territory by Israel. The first experience enabled him to develop a sensibility for difference constructions in general (e.g., ethnic groups, religious beliefs). The latter experience turned his attention to the fact that any construction of difference is interwoven with claims of power. During the period of colonialism, the claims of power and the social hierarchy of oppressor and oppressed were obvious, and colonizers could be called to account for their actions. The postcolonial situation was less transparent. Said argued that the oppression of colonial subjects continued through the mechanism of the Western construction of them as the opposite of the Western

world. In that sense, Said interpreted the distinction between Occident and Orient as an ongoing colonial construction and sign of political power that guaranteed distance between the imperial center and the (post)colonial periphery. For Said, any representation of the Orient is necessarily spatial; he calls this an imaginative geography that reflects the power relations of the inventor (colonial center) and the subjects of its imaginings.

Said developed the thesis of Orientalism out of his own experience: In reading texts and looking at paintings or pictures from the 18th and 19th centuries, he realized that the people portrayed had—almost—nothing to do with the real people of the Orient. They were mostly constructed either as Rousseau-like noble savages or as uncivilized counterparts to the developed and civilized Occident (Europe). In *Orientalism*, he took an approach to discourse analysis inspired by that of the theorist Michel Foucault. He analyzed writing, paintings, and reports by "Orientalists," including academics—philologists, anthropologists, and archaeologists—and nonacademics, such as writers and missionaries. He extended this with an analysis of the situation in the 20th century, postulating that the colonial stereotypes that constituted the Orient/Occident dichotomy were reinforced by the media, especially television and film. He argued that these intensified the imaginative demonology of the mysterious Orient.

What does Said mean by Orientalism? According to Said, Orientalism is the outcome of a historic process of defining Europe via the construction of the Orient as "other." This means that the *presence* of the Occident is a result of *representing* the Orient as the opposite via discourse and practice. In that sense, Orientalism can mean three different things:

1. It is an academic tradition of investigating the people, language, and culture of the East, from the Middle East to India, called Oriental studies. Oriental studies includes scholars from anthropology, sociology, history, philology, and other subjects. Orientalists produce the Orient through academic discourse.
2. A more general meaning of Orientalism is a style of thought based on ontological and epistemological distinctions made between the Orient and the Occident. This thinking is part of the cultural heritage of Europe and is widely reproduced, especially by poets, novelists, philosophers, political theorists, economists, and imperial administrators. Despite the diversity of countries and peoples considered "Oriental," such discourse tends to produce a homogeneous, stable image of an Orient without history. This image is a fiction and a projection of Western fantasies, but it produces a reality of ongoing colonialism.
3. It refers to the historical and real suppression of Eastern cultures and societies practiced in imperial and colonial intercourse. This reality is the imposition, through both physical force and discourse, of Western-style rule and Western cultural forms on non-Western cultures both past and present.

All three forms of Orientalism culminate in silencing the Orient in Western thought by constructing it as a passive object defined by the West.

But, in fact, the reality of colonial intercourse tended to blur the clear-cut dichotomy of the Orient and the Occident, as Said argues in *Culture and Imperialism* (1993). As cultures met, both in discourse and in physical locations, the result was hybridization rather than the creation of simple opposition. For Said, all cultures are hybrid constructions that interweave diverse elements. This hybridity only deepened as decolonization gave members of diverse cultures greater ability to define themselves.

At the end of *Orientalism*, Said raises a question that should concern all anthropologists: How does one *represent* other cultures? Said's work challenges the idea that cultures can be adequately described, at least by outside observers. Clifford Geertz noted that Said's argument implied that all descriptions of other cultures are necessarily products of specific researchers. As such, they reflect the culture, interests, and life history of their authors and are not the objective descriptions of cultures they purport to be. Thus, anthropological insights must be considered the constructions of anthropologists and not objective truth. Anthropology does not simply observe but rather creates its subject matter.

Other Works

After the broad recognition and reception of *Orientalism*, Said published two further books on the Levantine situation and Islam: *The Question of Palestine* (1979) and *Covering Islam* (1981).

But neither book achieved the success of *Orientalism*. In the 1990s, Said published two major works on postcolonial studies, *Culture and Imperialism* and *Representations of the Intellectual* (1994). *Culture and Imperialism* is an expansion and generalization of the ideas he developed in *Orientalism*.

Influence

Orientalism had a deep influence on all Orientalists, including anthropologists, and from there, Said's ideas infiltrated cultural and social theory as well as literature. *Orientalism* is considered a founding work of postcolonial studies, a milestone in the debate about representation within anthropology, and a fundamental contribution to the debate on difference (construction). *Orientalism* is still relevant to anthropologists and scholars, and it has become virtually impossible to do anthropological research without referencing Said's multiple insights. Said's ideas have also become important to the political engagement of Third World intellectuals. As these have become internationally prominent, they have demonstrated how previously suppressed voices have challenged and changed the relationship between periphery and center and increased cultural hybridity.

Homi K. Bhabha and Gayatri Chakravorty Spivak are among the prominent scholars influenced by Said's ideas. Bhabha emphasizes the aspect of cultural hybridity introduced by Said. Bhabha pleads for a "third space" of hybridity rather than the strict separation between Occident and Orient that Said uses in *Orientalism*. This "space between" gives members of interacting cultures the possibility of translating their own cultural contents into the language and practice of the other. Bhabha argues that transit through the "third space" inevitably alters the meanings of cultural contents. Culture is built through a process of translation, inscription, and articulation that leads inevitably to hybridity and makes "pure" cultures impossible. Because the "third space" allows the colonized to take part in the colonizer's ability to define the self and other, entering it gives people the ability to avoid the politics of polarity and exclusion.

Gayatri Chakravorty Spivak contributes additional insights and brings Said's insights to the new discipline of subaltern studies. Taking on Said's thesis of silencing the Orient and inspired by Michel Foucault's *The Order of Things*, she develops the idea of "epistemic violence." Because the voices of subaltern individuals have been silenced in the violent process of knowledge construction, they have been effaced from the history of colonialism. It is the job of current-day scholars of postcolonialism to restore these voices and recognize the historical contributions of subaltern individuals. In addition, Spivak argues that to gain increased political power, oppressed groups need to develop "strategic essentialism." That is, they must be able to represent themselves and act as a single large group while at the same time understanding that such collective identities are inevitably composed of numerous different smaller groups with competing and conflicting interests.

The use and development of Said's multiple ideas by Bhabha, Spivak, and numerous others keeps his work alive. Said's insights continue to contribute to anthropological theory and practice.

Sanday, Peggy Reeves

Peggy Reeves Sanday (1937–) is a U.S.-based cultural anthropologist, feminist, and public intellectual. Inspired by the legacy of Margaret Mead and

Franz Boas, Sanday sees anthropological research as a form of public service, working for the public interest on behalf of social equality. At the dawn of the feminist movement, Sanday made the then novel argument that male sociocultural dominance is not universal but rather emerges out of particular social environments. This pioneering contribution had a powerful impact on feminist anthropology and feminist theory more broadly, while reframing the Western understanding of patriarchy and matriarchy. Throughout her career, Sanday pushed the field of anthropology to produce and appreciate publicly engaged scholarship. To this end, she worked to establish the field of public interest anthropology. Across her career as an anthropologist and public intellectual, three themes emerge: (1) the importance of empirically driven scholarship, (2) the focus on social equality, and (3) the creation of scholarship that both speaks to and influences a broad audience.

Sanday received her PhD from the University of Pittsburgh in 1966 and took her first academic position at Carnegie Mellon University in 1969. In 1972, she became a tenured associate professor of anthropology at the University of Pennsylvania and was promoted to full professor in 1986. She retired in 2011.

Sanday was influenced by the theoretical and empirical legacies of George Peter Murdock, Ward Goodenough, and Clifford Geertz. She began her career as a mathematical anthropologist studying subcultural variations in the U.S. urban poor population. Even in these early writings, Sanday showed her propensity to focus on important public conversations, when she argued that cultural differentiation and structural inequality were more important factors than class and race, in understanding the inadequate school performance of children in poor and working-class communities in urban United States.

In the early 1970s, Sanday intervened in discussions on the widely publicized differences in Black/White IQ scores. At the time, prominent intellectual figures like the educational psychologist Arthur Jensen and the Nobel Prize–winning physicist William Shockley argued that the difference in IQ scores was based on genetic differences between Black and White populations. Sanday contested these claims, employing an anthropological understanding of the cultural context of knowledge that challenged the noncontextual, nonenvironmental approach of Jensen and Shockley. At the same time, she labored to bring this cultural argument to a broader public through publishing in popular journals and debating with Shockley on national Canadian TV. In an edited book, *Anthropology and the Public Interest* (1976), she broached the issue of a public anthropology, publishing and commenting on a series of anthropological studies of public issues.

In her first single-author book, *Female Power and Male Dominance* (1981), Sanday analyzed a worldwide sample of 186 societies for correlates of female power and male dominance. This study demonstrated that male dominance is neither universal nor even prevalent when viewed from a large-sample perspective. Her analysis suggested that male dominance tends to evolve as resources diminish and as group survival comes to depend increasingly on the aggressive acts of men. She found that male oppression of women is sometimes a strategy for responding to stress, be it stress due to decreasing food resources, population displacement, or the social oppression of constant warfare. Stress, she argued, constrains the male nurturing capacity, which she found is evident in sexually equal societies.

To seek further insight into the cultural context of gender relations, Sanday's next project was an ethnographic study of the Minangkabau of West Sumatra, Indonesia, a project that she pursued off and on between 1981 and 2009. This was a critical site of study because the Minangkabau are the largest and most stable matrilineal society in the world. In this long-term, field-based research, Sanday provided a detailed ethnographic analysis of how the Minangkabau matrilineal system works, through descriptions of cultural practices, origin myths, life cycle rituals, magical thought, and healing practices. Her research led her to redefine matriarchy, critiquing the Western definition, which makes matriarchy the mirror image of patriarchy in its emphasis on female dominance. In *Women at the Center: Life in a Modern Matriarchy* (2002), Sanday suggests that matriarchy, Minangkabau style, represents an egalitarian social system in which the dominant social symbols focus on growth in nature and the central cultural and economic role of the matrilineal line, giving both sexes prominent but different roles in upholding the matrilineal system.

During these years, Sanday also undertook a study of fraternity gang rape, which was motivated

by the rape of one of her students. In *Fraternity Gang Rape: Sex, Brotherhood, and Privilege on Campus* (1990/2007), she examined the fraternity party rituals and initiation rites on campuses across the country to understand the socialization for nonconsensual acquaintance sex. The book was written for a college audience and offers a chilling depiction of the sexual debasement of women at some fraternities. This work was followed by further research focused on the outcome of acquaintance rape in the courts and its portrayal in U.S. and European legal history, which resulted in *A Woman Scorned: Acquaintance Rape on Trial* (1996/2011).

Between 1999 and 2004, Sanday undertook a more intimate ethnographic study focused on the Wolfe Creek Crater in the Western Desert of Australia. Working with the local Aboriginal community, Sanday collected stories and paintings that detailed the meaning of the crater while delicately expressing the cosmological outlook of the Aboriginal people. This work was a personal journey for Sanday, as her father, the American geologist Frank Reeves, was the first Westerner to document the crater in 1947.

Sanday's long and varied career includes original research on the urban poor, male dominance, matrilineal society, and Aboriginal cosmology. The consistent thread that ties this work together is Sanday's focus on empirically driven, theoretically informed scholarship focused on human emancipation. She expressed this vision, intervening in the central social and cultural issues of the day, while arguing for a brand of engaged scholarship that could help cultivate a more humane world.

Sapir, Edward

Edward Sapir (1884–1939), the undisputed doyen of the linguists among the classic first generation of Franz Boas's students in American anthropology, carried out fieldwork on more than 30 different American Indian languages, dramatically simplified the classification of Native American language families, produced process-based grammars that remain models of linguistic description, and defined a phonemic level of analysis relying on native speaker intuition rather than on form alone. He turned in midcareer to what later came to be called culture and personality, emphasizing individual creativity within the patterns set out by language and culture, and was anthropology's primary representative in the Rockefeller Foundation–funded interdisciplinary social science of the interwar years.

Biography and Major Works

Sapir was born in Lauenberg, Pomerania, on January 26, 1884, to a Lithuanian Jewish family. His father, Jacob David Sapir, was a cantor whose ambitions led him to emigrate first to England and then to the United States, settling his wife, Eva, née Segal, and two sons in Richmond, Virginia, in 1890. After the death of Edward's brother Max, his father's career disintegrated, and the family moved to New York City's Lower East Side, where his mother ran a small notions store to support the household. While still in high school, Sapir won a prestigious Pulitzer scholarship designed to encourage the brightest of New York's immigrant children to pursue higher education.

Sapir used the scholarship to finance his education at Columbia University, where he majored in Germanic philology (as linguistics was known then), receiving a BA in 1904 and an MA in 1905. Impressed by the urgency of recording American Indian languages from what was in many cases the last generation of fluent speakers, he switched his

major to anthropology under the tutelage of Boas. Sapir carried over his training in Indo-European historical linguistics into his American Indian work. He completed his PhD in 1907 based on a summer of fieldwork with Takelma in Oregon, but the degree was not awarded until 1909 because of Columbia's publication requirement.

In 1907, Sapir accepted a research fellowship at the University of California, Berkeley, where his fellow Boasian anthropologist Alfred Kroeber was developing a research program to map the linguistic and cultural diversity of the state under the funding aegis of Phoebe Apperson Hearst. Sapir, who was less interested in the mapping mandate than Kroeber, concentrated on fieldwork in Yana, with a part-time foray into Chasta Costa. He resigned after a single academic year to move to the University of Pennsylvania, where he held a Harrison Fellowship under the direction of another former Boas student, Frank Speck. For the next 2 years, Sapir worked on Southern Paiute with Tony Tillohash, a bilingual student at Carlisle Indian School in Pennsylvania, whose insights into his own language would later be crucial to Sapir's definition of the "psychological reality of the phoneme." His proposed long-term research program on Ute and Paiute in the Southwest was not funded by the University Museum.

In 1910, Sapir became the first director of the Anthropological Division of the Canadian Geological Survey in the Department of Mines, a position he held until 1925. In the early Ottawa years, Sapir began a personal research program on the Northwest Coast, focusing on the Nootka (now called Nuu chah nulth), and assembled a research staff trained specifically in anthropology, in contrast to the amateur staff of the U.S. Bureau of American Ethnology. His permanent colleagues, the Eskimo (now called Inuit in Canada) specialist Diamond Jenness and the Quebec folklorist and ethnologist Marius Barbeau, were trained at Oxford under the tutelage of R. R. Marett. Sapir was also able to hire various members of his Columbia cohort, including Harlan I. Smith, Wilson Wallis, Paul Radin, and Alexander Goldenweiser, for short-term Canadian fieldwork. For a time, therefore, Ottawa had the largest contingent of Boasian anthropologists outside New York, but government research funding was devastated by the First World War and never recovered from the cutbacks imposed after 1916.

Sapir became increasingly depressed by the lack of opportunity to continue either his personal field research or the Division project of mapping the language families of the Dominion of Canada. Professional setbacks were compounded by the physical and mental illness of his wife, Florence, née Delson, a distant cousin whom he had married in 1910. By 1916, the couple had three children, and Sapir's mother took over the management of the household. During this period, for both personal and professional reasons, Sapir became intensely interested in psychoanalysis. At the same time, he was active in Ottawa literary circles, frequently publishing poetry and critical essays. These dual preoccupations set the foundation for his rethinking of the relationship between culture and personality. When Florence died in 1924, Sapir was open to pursuing opportunities elsewhere.

Back in the United States, Rockefeller Foundation funding to a small number of American universities was enabling collaborative research across the social sciences, particularly sociology and psychology. Sapir was called to the University of Chicago in 1925 as the superstar who would integrate anthropology into an emerging synthesis around the study of personality and society. The Chicago school of sociology had already established an ethnographic tenor, using the city of Chicago as its laboratory for social analysis. Here, Sapir found the intellectual stimulation he had been lacking. In 1926, he married Jean Victoria McClenaghan, with whom he had two more children. With the interactional psychologist Harry Stack Sullivan and the political scientist Harold D. Lasswell, Sapir began to insert an anthropological concept of culture into the interdisciplinary amalgam of society and the individual.

At Chicago, Sapir also continued his American Indian work. He undertook fieldwork in Navajo loosely tied to the Laboratory of Social Anthropology in Santa Fe and attracted a talented group of linguistic students, most of whom followed him when he took up a Sterling professorship at Yale in 1931 to direct a Rockefeller Foundation–sponsored seminar on the impact of culture on personality at Yale's Institute of Human Relations.

Anti-Semitism made Yale a much less attractive venue than Sapir had hoped. His frustrations were compounded by political cross-purposes at the institute, where his meaning-centered approach to ethnography, personality studies, and linguistic

description alike increasingly isolated him from the more quantitative and behaviorist direction of the program. Sapir suffered a heart attack in 1937 while teaching at the Linguistic Society of America's Summer Institute of Linguistics in Ann Arbor, Michigan. Cancelling a planned research year in China, he spent his sabbatical the following year in New York City in an attempt to recoup his health. He returned to teaching in the fall of 1938 but succumbed to a second heart attack on February 4, 1939. He was at the time president of the American Anthropological Association; his presidential address was read by Boas only weeks before his death.

Critical Contributions to Anthropology and Linguistics

Mapping Linguistic Diversity

At the start of Sapir's career, the classification of American Indian languages languished because adequate materials for comprehensive comparative work were unavailable for many languages and those that had been recorded suffered from the self-taught linguistic skills of most of the previous investigators. John Wesley Powell of the Bureau of American Ethnology had produced a 55-unit classification in 1891 based on questionnaire data in manuscripts inherited from the Smithsonian Institution and on the fieldwork of his own staff after 1879. In contrast, Sapir applied his philological training and extraordinary intuition for sound patterning in language to consolidate the number of linguistic families, using his own fieldwork to fill in gaps in the documentary record and ferret out the abstract underlying patterns that crossed related languages. There was a close relationship between Sapir's fieldwork and his historical comparisons. His Southern Paiute work led to a formulation of sound correspondences in Uto-Aztecan; he collaborated with Kroeber, Roland Dixon, and others to define the Hokan and Penutian linguistic stocks in California; his particular passion was Na-Dene or Athabascan, the language family that included Navaho and Hupa, on which he did fieldwork. He also sent his student Fang-Kuei Li to study several northern Athabascan languages spoken in Canada's Northwest Territories. Sapir believed that Athabascan tone would ultimately link up to Sino-Tibetan tone languages in Asia and thereby clarify the origins and successive migrations of the American Indians to the New World.

In 1921, Sapir proposed a classification of only six language families for all of North America (revised in 1929 to include at least tentatively a few previously unassigned languages). Like Powell, he presented no systematic data for his classification; but Sapir's proposal was much more extensive, based on grammar as well as sound changes extrapolated from the often superficial lexical evidence available to Powell. Sapir's proposed broad language families were as follows: Eskimo-Aleut, Na-Dene (in which he included Haida and Tlingit on the Northwest Coast), Algonquian-Ritwan (Sapir added two California outliers to the long-known Algonquian family), Penutian (moving outward from his own work on Takelma and Chinook and linking these Northwest Coast languages to the Californian and Mexican branches of what he believed to be a widespread language family), Hokan-Siouan (the far-flung grab bag of California and the North American interior), and Aztec-Tanoan (further extending the Uto-Aztecan stock that included Paiute).

Since its appearance, the six-unit classification has polarized linguists between "lumpers," like Sapir (and those who took his larger groupings at face value without examining the detailed evidence), and "splitters," who required systematic proof, preferably through detailed sound correspondences, of particular connections before they could be considered proven. Linguistic opinion has shifted over recent decades toward retaining a larger number of stocks than Sapir envisioned, as exemplified in the work of Lyle Campbell, Marianne Mithun, and Ives Goddard. Nonetheless, Sapir's suggested larger groupings remain tantalizingly plausible and continue to invite comparisons for future demonstration of a historical relationship. Sapir's conviction that culture history could be extrapolated from the linguistic relationships of peoples continues to tie anthropological linguistics to anthropology as a whole and to maintain the possibility of convergent evidence across the four traditional subdisciplines.

Ethnographic Inference From Language

Sapir's language classification was in one sense internal to philology or historical linguistics, based on the assumption that sound change and other

linguistic processes operated the same way in unwritten languages as in Indo-European ones. In addition, however, Sapir aspired to draw the linguistic relationships among the various tribes into the theoretical toolkit of his fellow anthropologists. He believed that language was unique among the parts of culture because of its formal structure; the existence of systematic sound correspondences would demonstrate unambiguously that resemblances across languages reflected previous historical identity rather than borrowing as a result of culture contact.

By 1894, Boas, despite an early flirtation with extending linguistic classification on the Northwest Coast, had concluded that past historical relationship could not be distinguished from more recent borrowing among peoples living in proximity but initially speaking unrelated languages. Boas's own historical reconstructions relied on the borrowing and reworking of folklore elements rather than on linguistic form. The analysis of language, for him, became primarily a question of the psychological tenor of a language as reflected in its grammar and in texts recorded from native speakers, a point of access to "the native point of view" rather than a means of reconstructing culture history.

In 1916, Sapir produced his manifesto on why the anthropologist needs linguistics. "Time Perspective in Aboriginal American Languages: A Study in Method" presented concrete examples for the reconstruction of broad historical movements based on linguistic evidence and illustrated how cultural phenomena were encoded in language. For example, four cognates (related lexical items) demonstrated the northern origin of the Navajo: *Corn* was glossed as "enemy food," and the word for *snow* was adapted to a southwestern desert environment. Sapir's colleagues welcomed his methodological paper because they had few other data for historical inference. Archaeology only began to provide relative dating after 1927, when tree-ring dating provided the first reliable time sequences, although these applied only to the Southwest. There was little recognition of oral tradition as a source of reliable historical evidence.

Language and Linguistic Theory

Sapir was a major player in the emergence of an autonomous discipline of linguistics distinguishable from its North American origins in anthropology and in literature or folklore. Boas remained the senior figure, but Sapir was the "real linguist" in the anthropological camp, soon joined by Leonard Bloomfield, a Germanicist who did fieldwork on Cree and reconstructed proto-Algonquian (the reconstructed common ancestor of Algonquian) on the basis of four contemporary Algonquian languages. These three men collaborated to obtain funding from the American Council for Learned Societies for extensive American Indian linguistic fieldwork, primarily by their own students.

In linguistics, Sapir has long been esteemed as a general linguist. His paper defining the phonemic or meaningful level of sound patterning in language appeared prominently in the first volume of *Language* in 1925. Sapir's new "concept" was independent of European formulations by the Prague school at about the same time. In a 1933 elaboration of his position, Sapir used the linguistic intuitions of the native speakers he had worked with (Tony Tillohash for Southern Paiute, Alex Thomas for Nooktka, and Albert "Chic" Sanodoval for Nootka) to argue that the linguist should attend to the categories implicit in the understanding of their own language by fluent speakers. "Psychological reality" was the proper goal of grammatical as well as phonemic analysis. Sapir's own grammars, especially of Southern Paiute, still stand as models of how to incorporate meaning and process into the scientific study of language.

Sapir's only book, *Language: A Study of Speech*, appeared in 1921 and was directed toward a popular audience. Sapir alternated examples from English and familiar European languages with others taken from the American Indian languages he had studied. The equal subtlety and expressive power of these languages were taken for granted. This book remains an elegant statement of the beauty and complexity of the human capacity for language as Sapir understood it.

Linguistic Relativity

The so-called Sapir-Whorf hypothesis of linguistic relativity often has been misinterpreted as a claim for linguistic determinism. Neither Sapir nor his protégé Benjamin Lee Whorf intended such a reading. Indeed, both were much impressed by the capacity of grammatical categories to structure habitual thought. Nonetheless, conscious reflection and

what Whorf called "multilingual awareness" made it possible to think outside the boxes of "habitual thought" in one's native language. John Leavitt summarizes the history of this misinterpretation and contextualizes the return to Sapirian approaches toward the immense diversity of human languages in recent years, after decades of searching for linguistic universals whose pervasiveness seemingly trivialized the uniqueness of particular languages.

The Impact of Culture on Personality

At Yale, Sapir ran a seminar training foreign scholars to analyze their own cultural background and its correlates in personality. He also encouraged several anthropology graduate students to undergo training analysis in the same way that psychoanalysts did, so that they could study personality in a range of American Indian cultures. He was an active and charismatic participant in the Rockefeller Foundation Hanover (New Hampshire) Conferences of the late 1920s and early 1930s, drawing parallels of method between the anthropologist's life histories and the psychologist's clinical case histories. Sapir rejected a simplistic division of culture and individual personality, seeing these as sides of a single coin (what we might today see as a question of observer standpoint). He spoke of "the impact of culture on personality" and thereby preserved the capacity of the creative individual to modify culture and escape any hint of determinism in its influence. The Culture-and-Personality school of thought that developed within anthropology after Sapir's death under the intellectual leadership of Ruth Benedict and Margaret Mead was oriented toward the comparative study of whole cultures. Thus, Sapir's emphasis on individual agency and creativity as expressed in language was marginalized. These concerns reemerged not in relation to psychology and psychoanalysis as Sapir had envisioned but rather out of a post-Chomskian cognitive linguistics.

Sapir's Legacy

The centenary of Sapir's birth in 1994 produced a spate of scholarship in both anthropology and linguistics. Papers from an Ottawa conference were edited by William Cowan, Konrad Koerner, and Michael Foster in 1986. An editorial board chaired initially by Sapir's son Phillip undertook a *Collected Works of Edward Sapir* project, planned in 15 volumes, including newly annotated unpublished linguistic field notes and manuscripts, about half of which have now appeared through Mouton de Gruyter, Berlin. Judith T. Irvine edited several extant sets of class notes for Sapir's never written book on "the psychology of culture." Regna Darnell produced a biography covering the full interdisciplinary range of Sapir's work.

Sapir is the only Boasian to whom the epithet of genius is regularly applied, by both his peers and his successors. His students (e.g., Harry Hoijer, Morris Swadesh, Mary Haas, Stanley Newman, George Trager, Benjamin Whorf, and Carl Voegelin) and their students maintained his legacy by establishing the study of Native American languages in departments of both anthropology and linguistics. Linguistic anthropology continues to be closely associated with the ongoing study of American Indian languages.

Sapir's capacity to draw connections between languages and across academic disciplines has continued to inspire and to pose questions for contemporary scholars. In the positivism of post–World War II America, Sapirian perspectives receded for a time, but the study of meaning in both culture and language has returned to the attention of anthropologists since the 1960s.

Sapir-Whorf Hypothesis and Neo-Whorfianism

The so-called Sapir-Whorf hypothesis holds that language plays a powerful role in shaping thought, perception, and action, especially in relation to the worldview of an associated culture.

Historical Perspective

The idea that language guides perception is often associated with the writings of Edward Sapir and his student Benjamin Lee Whorf. While both had much to say about the role of language in the coordinating perspective during social interaction, many writers throughout history have commented on connections between language, thought, and perception.

Aristotle (384–322 BCE) observed that political rhetoric, when phrased in gripping poetic terms, has the potential to stir an audience to action, even in the name of some absurd slogan, a phenomenon that reaches its height when reason is overpowered by emotion. Subsequently, many philosophers granted language a prime place in human social cognition. The Italian philosopher Giambattista Vico (1668–1744) was one of the first to advance a theory of conceptual relativity, holding that humans universally build imperfect models of the world, which take on the status of a kind of virtual reality, as revealed by the changing face of science or religion throughout the ages—and as reflected in figures of speech. In Germany, this assessment was echoed by Wilhelm von Humboldt (1767–1835), who proposed that language functions as an organ of thought, with diverse languages leading speakers to different observations about the world, a phenomenon that Whorf later called the linguistic relativity principle. At the same time, von Humboldt proposed a theory of universal grammar, seeing traces of a common architecture behind the linguistic structures of the world—the differences arising as the historical products of creativity. Franz Boas, one of the founders of American anthropology, was aware of this tradition, which in turn came to influence his primary student in linguistics, Edward Sapir.

The Role of Vocabulary

Both Sapir and Whorf strongly asserted that vocabulary provides a key to one's worldview, in so far as a speaker's choice of words not only reflects a given perspective but also encourages its adoption. This principle was earlier articulated by Boas, who noted that vocabulary is often developed in areas of cultural interest, such as specialized religious knowledge. Boas commented that while sensory experience is infinitely subtle, languages classify these perceptions into a small set of categories, even if the classification is imperfect. Citing as an example the Baffin Island Eskimos, for whom there are separate words for snow in different situations (e.g., on the ground, in the sky, or in a drift), he argued that languages develop words for habitual conceptual distinctions; thus, what English speakers differentiate into lakes, rivers, streams, creeks, brooks, rain, dew, foam, waves, and ice might receive less attention in another language, occurring as variations on a single root for "water." Most anthropologists now take it for granted that these differences in vocabulary give rise to a relativity of local cultural habit, not of human potential. Consider the jargon of the professions.

Sapir himself went on to consider the relationship between language and thought in actual social circumstances, especially in relation to expressive culture. Seeing language in aesthetic terms, he often dwelled on the difficulty of translating poetry, since there is inevitably a mismatch in sound or meaning or rhythm when passing between traditions. He parted with Boas in insisting that language not only reflects reality but also resonates with the social imagination, as when interpreting poetry against the backdrop of religion. To illustrate this principle, consider the following line from George Herbert's (1593–1633) "Matins," wherein larger meaning hinges on the specific use of the word *sunbeam*. In the implicit context of addressing God, it refers specifically to Jesus and the cross.

Teach me thy love to know;
That this new light, which now I see

May both the work and workman show
Then by a sunbeam I will climb to thee.

Sapir also noted that language is more than a conceptual system, since words evoke emotions; many words convey a feeling tone and cast an evaluation. Viewing language as social and creative, he compared it with a work of art produced over many generations, imbuing each word with symbolic overtones. Passing from one language to the next meant shifting one's aesthetic and emotional sensibilities, while invoking a parallel shift in the content of the social or literary imagination.

Returning to the Boasian sense of language as a conceptual system, Whorf came to view language as an instrument of thought—capable of conveying whole cosmological systems or even leading speakers astray with misconceptions. In his work as a fire insurance inspector, he found that when speakers spoke about an accident, their descriptions provided a key to the misunderstanding that led to the disaster. In one example, vapor-filled gas drums were mistakenly described as "empty," a conception that went unquestioned until there was an explosion. Similarly, what workers described as inert "scrap lead" actually contained wax, leading to a similar lack of caution around this equally flammable substance. Whorf suggested that our habit of referring to time in "long" or "short" durations in English leads to the imaginary conception that time flows in a linear fashion rather than merely "getting later," without any real spatial path.

The Place of Grammar

In a departure from the linguistics of his times, which was dominated by historical studies, Boas took great pains to depict the relativity of linguistic structures, carefully documenting the phonology, vocabulary, and grammar of each language he encountered. While grammars everywhere serve a similar functional role, allowing speakers to communicate abstract concepts in near-shorthand form, he observed that there were parallel ways of solving similar practical problems, such as singling out a given person in speech with pronouns or referring to a given point in time with tense markers. Since these grammatical categories vary in both meaning and structural configuration, he noted that a well-formed construction might create different mental imagery from one language to the next. Classifier languages like Navajo, for instance, place great focus on the shapes that objects take when in motion or at rest—a matter that rarely comes up at all in languages like English, where this is not a grammatical requirement. Yet he was careful to note that languages rarely completely flesh out thoughts, since any given construction may say more or less than the speaker meant.

In carrying out his own research on indigenous languages, Sapir observed that grammatical categories often held psychological and cultural overtones when seen in full social context. While heeding the Boasian caution that language rarely lends full expression to thought, he continued to explore the notion that it might channel the flow of ideas, even without the speaker's conscious awareness. Inspired by Gestalt psychology, he suggested that speakers often unconsciously intuit the meaning of complex constructions, while projecting related cultural expectations onto experience in an associative fashion. Echoing Boas, he observed that speakers are inclined to impose categories from their own language onto sound perception, noticing patterns that fit their expectations while ignoring others; in other words, people tend to hear what they expect, often based on their cultural or linguistic conditioning, tuning out what does not fit their preexisting understanding. Similarly, few speakers pause to consider the semantics of grammar—such as the past or future in English—instead arriving at the meanings without a second thought, taking these grammatical categories as "natural" or "given" rather than as psychological projections. Some languages, by contrast, divide the past or future into far more categories than English requires—including an "immediate future" or "ancient past." Taking a historical perspective, Sapir observed that grammars change over time, often in response to social or cultural practices, such as the need for a special "ancient past" when delivering stories set in mythological times.

Inspired by Sapir's psychological insights, Whorf went on to suggest that our entire sense of the universe may be at the mercy of language, arguing that we arrive at a socially constructed sense of reality by projecting meanings onto experiences in accordance with the models laid out in our native tongue. He began by questioning the notion that people everywhere conceptualize space or time according to the same models, even if they start with the same experiences in the physical world. Drawing

a two-way comparison between the "thought-worlds" of English and Hopi, a Native language of the Southwest, he contrasted the linear sense of time in English, as reflected in our practice of counting days as if they were like objects that accumulate, with the cyclical sense of time in Hopi, where the focus is on the recurrence of events, like the sun rising. In this way, Whorf suggested that humans inhabit different worlds of habitual thought by virtue of participating in the conceptual systems of specific languages.

Neo-Whorfianism

In the years following World War II, the metalinguistic writings of Sapir and Whorf attracted a great deal of attention. The linguist Harry Hoijer created an industry among anthropologists, linguists, and psychologists when he boiled these ideas down to what he called the Sapir-Whorf hypothesis. The expression is a misnomer since Sapir and Whorf did not collaborate and had different agendas. Furthermore, neither approached the linguistic relativity principle as a scientific hypothesis. Nevertheless, Hoijer proposed that if anthropologists hypothesized that language has an impact on thought, it would be important to "test" the hypothesis. Crude but testable versions began to circulate as linguistic determinism based on the formulation that language governs thought rather than influencing it. In a truly Whorfian fashion, this misleading label has sparked a great deal of activity in the names of Sapir and Whorf, who probably would not have recognized the resulting formulations.

Empirical Studies: Testing the "Whorfian Effect" in the Laboratory

While Sapir and Whorf worked through cross-cultural comparison, observing language use in social settings, the recent trend has been to test the effects of language on perception in nonlinguistic settings—leading to observations of what is now called the Whorfian effect. One of the first studies, conducted by Eric Lenneberg, showed that having a name for a something as simple as a color (codability) affects recognition and later recall. Returning to the Whorfian method of comparison, John Lucy demonstrated that grammatical categories such as plural markers affect the subject's ability to assess the number of objects in a scene. Stephen Levinson has demonstrated that language can have a profound impact on a range of activities, such as remembering the spatial layout of a scene. Speakers of languages like Guugu Yimidhirr of Australia pervasively use cardinal points like north, south, east, and west since these concepts are embedded in the grammar and their language offers no other directional options, like left or right. Not surprisingly, Guguu Yimidhirr speakers outperform English speakers when it comes to remembering cardinal points.

Humanistic Research: Poetics, Ideology, Multilingualism, and Metaphor

A parallel line of inquiry focuses on the role of language in facilitating the play of perspective in social interaction. Dell Hymes was a pioneer in this area, arguing that linguistic relativity as a cognitive phenomenon was secondary to the relativity of social practices. Following Sapir, he advocated for a return to aesthetics, uncovering the poetic strategies in oral narrative, illustrating the diversity of the literary imagination. Paul Friedrich has shown that ordinary language is often pervasively poetic, including grammatical features, giving rise to diversity on the basis of creativity. Michael Silverstein has shown that speakers differ in their awareness of linguistic features, while a community's assessment of a trait, such as the use of informal (now archaic) second-person pronouns, like "thee" and "thou," can have a profound impact on the historical development of grammar. Thus, language is an ideological field where worldviews collide and change over time. He showed that when 17th-century Quakers protested against social hierarchy by dropping the use of "you" with superiors, using the egalitarian forms "thee" and "thou" with everyone, they set off a chain of events, throwing the pronoun system into confusion and resulting in the loss of *thee* and *thou* in English today. In this vein, Sean O'Neill has shown that when languages come into contact, speakers sometimes insist on accentuating their (preexisting) differences; thus, multilingualism and an awareness of diversity can heighten the extent to which languages maintain separate grammars, vocabularies, and storytelling traditions, as he observed among the Hupa, Yurok, and Karuk languages of California. Following Aristotle, George Lakoff has shown that while many metaphors have a basis in universal experiences, such as transferring

traits from animals to humans (e.g., "He badgered me"), there is a creative element in language, giving rise to endless diversity even in the face of profound universals.

Saussure, Ferdinand de

Ferdinand de Saussure (1857–1913) was a Swiss linguist whose ideas about the scientific study of language provided the basis for what came to be known as structuralism. In the field of linguistics proper, he is widely recognized as the father of 20th-century linguistics. More broadly in the humanities and social sciences, his ideas are linked to those of the philosopher Charles Sanders Peirce, to make Saussure a cofounder of semiotics, the all-encompassing study of sign systems, of which language is but one.

Saussure's most radical departure from previous views of language lies in the distinction he made between *langue* and *parole*. The colloquial meaning of *langue* is "tongue; language," while *parole* means "speech; word," as in "take my word for it." Saussure meant something very different by these terms. Locating them in two distinct portions of the neuropsychological circuitry that underlies listening and speaking, he said that langue is the portion in which auditory images become associated with concepts, while parole is the portion in which speakers' communicative intentions become associated with producible output. Saussure went on to say that of these two components, the proper focus of the scientific study of language is langue, because it is shared by everyone in a given speech community. In fact, it is the shared ability to associate specific auditory input with the same concepts that defines a speech community. In contrast, Saussure said, parole is diverse and confusing because speakers use their language in idiosyncratic and unpredictable ways. Even though linguists are forced to infer the contents of langue from the messy evidence provided in parole, they must maintain a strict commitment to the description of langue, on which the structural stability of language depends.

Saussure himself frequently drifted away from his own langue-focused definition of linguistics to talk about the vagaries of parole, in which are found the ingredients of potential changes in langue when meaning-to-sound connections made by individual speakers come to be widely understood by the collective, and thus incorporated into langue. Despite such internal confusion and occasional inconsistencies, Saussure maintained a constant emphasis on structure: the interdigitated and oppositional nature of systems of sound, of systems of meaning, and of the sign systems they define. For this, Saussure is widely recognized as the founder of structural linguistics.

Intellectual Biography

Ferdinand Mongin de Saussure was born in Geneva, Switzerland, to a Calvinist family famous for having produced a long line of accomplished scientists and scholars. During his lifetime, Saussure published only one work of lasting note. Finished and printed when he was only 21, his *Memoire sur le système primitif des voyelles dans les langues indo-européennes* (Dissertation on the Primitive Vowel System in the Indo-European Languages) employed the rigorous comparative method developed by his

mentors at the University of Leipzig, where he had gone at the age of 19 after a year of studying Latin, Greek, and Sanskrit at the University of Geneva.

Saussure's Leipzig professors were the most prominent of a group of mostly German Indo-Europeanists known as *Junggrammatiker* (Young Grammarians), who were doing fierce battle with other linguists of the time regarding the regularity of sound changes in the Indo-European languages. The neo-grammarians (as the *Junggrammatiker* are known in English) held that changes in the pronunciation of words follow a strictly regular pattern: A change in a given sound simultaneously affects all of the words in which the conditions for that change are met. Apparent exceptions to this principle, the neo-grammarians insisted, could be resolved by a more careful and detailed examination of the conditions and timing of the changes observed. For example, a sound in initial position in a word may undergo a shift without affecting that same sound in the middle or at the end of a word. This principle eventually proved to be overstated: Some changes do take place in only one or a few words and spread gradually, if at all, to words that the neo-grammarian hypothesis would predict they should apply to immediately and without exception. But the neo-grammarians succeeded in resolving a number of otherwise irregular patterns of sound change. And the strict regularity of relations among the sounds in a language at a given point in time became a key component and arguably the guiding principle for many other aspects of the as yet unborn Saussurean structuralism.

On the basis of observed but previously inexplicable variations in the vowel systems of languages in the Indo-European family, Saussure's *Memoire* put forward a reconstruction of the sound system of the family's common ancestor that contained consonantal elements, which Saussure called *sonorant coefficients*, later called *laryngeals*, which were absent from all the then known members of the family. This revolutionary departure from previous work in the field provoked skeptical displeasure from his professors at Leipzig, who found it far too speculative. They nevertheless awarded Saussure a doctorate in 1880, but only after he submitted a dissertation on the genitive absolute in Sanskrit that he wrote during a year of study at the University of Berlin. Shortly afterward, Saussure took a position at the École Pratique des Hautes Études in Paris, but after a decade, he had not managed to rise above the rank of *maître de conférences* (assistant/associate professor or senior lecturer). In 1891, he accepted a professorship at the University of Geneva, where he spent the rest of his career.

Although the controversial reconstruction in the *Memoire* was largely vindicated in 1927 by means of newly discovered inscriptions in Hittite, and would therefore have sufficed to put Saussure's name on the all-time list of brilliant historical linguists, none of Saussure's writings during his lifetime explain the depth and breadth of Saussure's long-term intellectual impact. This derives overwhelmingly from lectures he gave late in his life. Until the end of his fifth decade, Saussure's teaching, like his few writings, had focused entirely on Indo-European historical linguistics. It was only with the unexpected death of a colleague that Saussure, in 1907, took up responsibility for a first-year course in linguistics, which he taught three times before his death from cancer at the age of 55. Not long after, his colleagues and students, impressed by the originality and scope of Saussure's lectures, pieced together and expanded on Saussure's and his students' surviving notes to create the *Cours de linguistique générale* (Course in General Linguistics, 1916; revised 1922).

The *Cours*

Edited by Charles Bally and Albert Sechehaye, who became in turn the successors to Saussure's Geneva professorship, the *Cours* gave rise to innumerable and often contradictory commentaries. The *Cours* not only smooths over problematic discrepancies among Saussure's three series of lectures—not always in favor of the later versions—but also contains material not found in anyone's notes, thus ensuring a continuing debate over Saussure's actual beliefs and original intent. Even so, the *Cours* came for many to define the field of linguistics and to contribute vitally to the intellectual movement known as structuralism, characterized by key ideas such as langue versus parole (mentioned above), diachrony versus synchrony, signifier and signified, the arbitrariness of the sign, meaning versus value, and syntagmatic versus paradigmatic. Although each of these ideas can be described in turn, they are interdependent in ways that exemplify the central tenet of Saussurean theory: that any system of

signs—linguistic theory included—consists of inextricably interrelated components.

Langue Versus Parole

To recapitulate briefly, Saussure defined langue as the largely homogeneous, socially shared knowledge of how to interpret the signs of a given language, while parole, which provides the observable evidence on which linguistic description depends, is the heterogeneous, idiosyncratic linguistic output of individual users of a language.

Saussure's langue/parole distinction has probably been more misunderstood than any other distinction in modern linguistics. Chief among the sources of misunderstanding is Saussure's observation in the *Cours* that langue is the social part of language, beyond the control of individuals, who depend on its shared nature to make their parole intelligible to others. This identification of langue as a social fact resonated with the work of Émile Durkheim and others who sought to identify values and social structures that transcend the individual and exercise control over the thoughts and the behavior of people in a given society. However, as shown by Saussure's clear localization of langue in the receptive portion of each individual's language-processing system, the notion that langue resides in a realm of reality outside of individual members of a speech community in no way corresponds to Saussure's clear intent. Furthermore, when Saussure goes on to observe that parole lies solely in the domain of the individual, with no two speakers employing exactly the same connections between meanings and sounds in their speaking, this does not mean that parole has no social effects. Parole is after all the sole source of changes in langue, as new meaning-to-sound connections come to be used by other speakers and, over time, take their place in the shared langue of the community. Thus, some individual facts become social facts in Saussure's theory.

Another common misconstrual of the langue/parole distinction consists of equating it to Noam Chomsky's famous competence/performance distinction. On this reading, langue loses its place in receptive language processing and becomes a set of abstract structure-defining rules (in Chomsky's view, a *generative grammar*), which somehow apply in both receptive and expressive processing, while parole becomes the victim of innumerable factors that impinge on the perfect realization of langue in listening and speaking. This bears no similarity to anything Saussure is known or thought to have said or believed. Clearly, despite the best efforts of Saussure and the many proponents of his ideas, the auditory image of the word langue has as yet failed to become associated with a shared concept in the langue of the speech community known as Academe, thus disconfirming Saussure's claim that linguistic signs are by definition shared.

Diachronic Versus Synchronic Study of Signs

To understand diachronic patterns of change in signs over time, we must first possess accurate synchronic descriptions of sign systems at particular points in time.

This distinction grew directly out of Saussure's training by the neo-grammarians. The regularity of sound change discerned by the neo-grammarians derives, Saussure believed, from the synchronic structure of a language at a particular point in time: A system of sounds constitutes not merely a helter-skelter collection but rather a well-tuned constellation of what is usually a very small set of distinctive sounds. The exclusive focus on the synchronic description of language by many linguists since Saussure, unheard of in prior generations, clearly shows the impact of this fundamental shift of attention.

Another effect of the diachronic/synchronic distinction relates to matters of prescriptive grammar and word usage. Would-be rule givers cannot legitimately appeal to the diachronic origins of particular constructions or words as the basis for condemning or condoning their deployment by present-day members of a speech community: The "proper" use of a language is strictly and entirely determined by langue, which prescribes how the members of that community understand it. If that understanding changes over time, then the language has changed.

Signifier and Signified

This pair defines every sign; in language, the pair consists of an auditory image and an associated concept.

Despite extensive discussion in the *Cours* of physiological-articulatory aspects of speech sounds, and occasional use of dual or bidirectional arrows (some of which were erroneously added by the editors of the *Cours*) to show the connections between

signifiers and signifieds, Saussure explicitly states that langue (the proper primary object of linguistic interest) is located in the receptive rather than the executive part of the human brain. Drawing directly on the work of the French surgeon Paul Broca and the German neuropathologist Carl Wernicke of the last decades of the 19th century, Saussure identifies the executive portion of language in what is now known as Broca's area in the left frontal lobe of the cortex and the receptive portion in Wernicke's area in the left temporal lobe. It is in the latter that auditory images (constructed in Heschl's gyrus immediately below Wernicke's area) become associated with concepts (which, we now know, triggers a host of additional semantic processing in the posterior lobes). Later linguists, most notably Edward Sapir, maintained the primacy of the receptive mode of language, but many, including Leonard Bloomfield, abandoned this principle, and by the last decades of the 20th century, with the rise of generative grammar in the work of Noam Chomsky and his followers, most descriptive linguistics took either a processing-neutral or an execution-oriented approach.

The Arbitrariness of the Linguistic Sign

Partial exceptions to this principle exist in the form of onomatopoetic words (buzz, oink, plink, etc.) and sounds (long vs. short; slip, slide, slurp, etc.), but even these differ across languages, thus confirming the lack of universal a priori connections between sounds and meanings. A warning must be borne in mind, however: Once a particular connection has been established, both the signifier and the signified are, to some extent, fixed; associating an existing signifier to a new signified creates ambiguity or confusion and creates a point of tension in the sign system. For example, once the signifier *south* has been associated with one of the four points of a compass, it becomes very unlikely that an attempt to associate it with a second of those points will stick, but the signifier *bank* is associated with both financial institutions and rivers. Such homonyms create little problems for understanding unless they occur in very similar contexts. If someone asks me if I saw a bat on the front lawn when I pulled into the driveway, I might well not know whether I am being asked about a flying rodent or a length of wood. When a particular ambiguity becomes frequent, speech communities can resolve it by adopting a new signifier for one or another of the signifieds to which it is attached, but existing tensions nevertheless often persist, and new ambiguities arise over time.

Because of the arbitrariness of signs, the association of signifiers to signifieds must be acquired anew in every generation through exposure to language input. At the same time, this sociocultural transmission makes possible the inevitable and constant shifts in connections between signifiers and signifieds that result from changes in sound systems and the *value* of signs (see below) brought about by the multifarious structures and functions of parole.

The Meaning Versus the Value of a Sign

A sign's *meaning*, with respect both to its reference to a particular object, event, or quality in the world and to what it conveys regarding that referent in a given instance of use in parole, is shaped by circumstance, while its *value* depends on how it contrasts in conceptual function with other signs in langue, the entire sign system. Meanings, as products of parole, are rich in contextual content while values, as elements of langue, are minimalist distinctive semantic features that serve to distinguish signs from each other. An example is the word *dog*, the value of which is simply the set of characteristics that distinguish members of the canine species from other species and from other physical objects, while its meaning in the sentence "Suddenly the dog jumped up and came running toward the open door" will depend on the hearer's or reader's general and specific knowledge of how dogs move and why this particular dog might be running to this particular door.

This feature of Saussurean theory, without acknowledgment, has become well-known to the 21st-century linguists in the design of neural networks for the modeling of language processing (see, e.g., Hudson, 2007). As they undergo what network modelers call "spreading activation," the nodes in these networks act very much like Saussure's "values" as they, along with input from other sources, trigger the activation of increasing numbers of semantic nodes to result in a full-blown "meaning" as a configuration of activated nodes. Notice, too, that the train of thoughts that might arise as the result of receiving a sign clearly goes well beyond the minimalist workings of langue: Saussure did not claim that langue could account

for the explosion of interpretive events but merely the first-phase mapping of signifiers onto the values of their respective signifieds. This same modesty applies to neurolinguists' claims about what happens in Wernicke's area: Words are recognized there as meaning-triggering units, but the full interpretation of a received utterance can involve vastly larger expanses of the cortex.

Syntagmatic Versus Paradigmatic Relations Among Signs

Every sign relates both syntagmatically to other signs that might occur before or after it in a syntactic or other linear construction and paradigmatically to signs that might replace it in a particular position in such a construction.

In other words, syntagmatic relations necessarily exist among the signs that occur in a particular sequence of signs, while paradigmatic relations exist among the signs that might be placed into each of the slots in that sequence. For example, the verb-object relation between *love* and *peace* in the sentence *I love peace* is syntagmatic, while the synonym-antonym relations between *love* and *hate* and between *peace* and *war* in the sentences *I love peace* and *I hate war* are paradigmatic. In the end, the syntagmatic and paradigmatic relations among signs—and also among the elements of a sound system—are what constitute the formal and functional oppositions that make them a structured system as opposed to a mere collection.

By the middle of the 20th century, these two analytic dimensions had gradually become the basis for description of what structural linguists recognized as separate "levels" of structure in language (see "Prague School of Linguistics"). It was already clear that the syntagmatic/paradigmatic distinction applied not only to sign systems as a whole but also to the perceptible constituents of signs, that is, signifiers: Syntagmatic relations exist among paradigmatically related elements in the sequential ordering of articulatory gestures and auditory cues ("distinctive phonetic features") and individual speech sounds ("phonemes"), as well as among meaningful strings of sounds ("morphemes" or "words"), or "signs" as linkages of signifiers to signifieds. By extension, these same syntagmatic/paradigmatic relations can be seen in a cascade of increasingly complex forms ("sentences" and "discourses") constructed from simpler signs and also in the semantic values of words, which can be broken down into "sememes," such as male versus female or fast versus slow. The most extensive elaboration of this approach can be found in the work of Sydney Lamb and his students. Parallels also exist in analysis of the structure of pragmatic interactions and narratives, which can be broken down into interdependent "speech acts," such as conversations containing pairs such as question versus request or acceptance versus denial, or stories with sections identifiable as exposition, development, climax, and dénouement. The last examples show why structural linguistics has had such a profound impact in the field of literary criticism.

Saussurean Theory Beyond the Study of Language

Applications of the principles described above have occurred in a wide variety of scholarly disciplines. Within anthropology, understanding of archaeological remains, nonverbal communication, myths and rituals, and a host of other cultural artifacts and practices have benefited from structural semiotic analysis. The structural approach gave rise not only to the structural anthropology of Claude Lévi-Strauss and the various branches of structuralist theory and reactions to it that arose over the past century, but also to rich developments such as cognitive and symbolic anthropology (see Colby, Fernandez, & Kronenfeld, 1981; D'Andrade, 1995) and biogenetic structuralism (see Laughlin & d'Aquili, 1974). In fact, for field after field across the arts and sciences, it is hard to imagine how they would look in the absence of the principles articulated by Ferdinand de Saussure.

Scapes

Scapes are a set of topographical metaphors that played a key role in the anthropology of globalization as it was developed in the 1990s. The concept is inextricably linked to the work of the anthropologist Arjun Appadurai. He first introduced the idea in his 1990 article "Disjuncture and Difference in the Global Cultural Economy" and subsequently refined it, and it became the cornerstone of his book *Modernity at Large*, published in 1996. Like many other anthropologists at the time, Appadurai was looking for a new descriptive language to capture how cultural globalization cuts across traditional political and social boundaries while cultural reproduction is occurring outside the nation-state and supposedly stable cultural entities. This entry describes the theoretical importance of scapes for disentangling the dynamics of global processes.

In his attempt to capture the shifting interconnections between the local and the global, Appadurai characterizes the global cultural economy as a complex, overlapping, and disconnected order that is highly unpredictable. Global cultural flows of capital, goods, information, and people occur in and through the disjunctures between five dimensions, which he terms "scapes"—ethnoscapes, technoscapes, financescapes, mediascapes, and ideoscapes. As a scape refers to both a "scene" and a "view," the notion lends itself expediently to analyzing the way people experience and understand their world(s), thereby superseding standard geographical thinking in social cultural analysis. Importantly, Appadurai does not see scapes as parts of a united global system. They interrelate but are not causally ordered; no single organizing principle rules. Together, scapes provide a framework for making sense of transnational cultural flows and a way of connecting the deterritorializing forces of globalization with the situated production of specific localities.

Ethnoscapes refer to all people making up the globalized world in which we live (although Appadurai privileges mobile groups such as tourists, immigrants, refugees, exiles, and guest workers). The prefix "ethno" refers to people rather than strictly to ethnicity. Ethnoscapes are the landscapes of group identity, no longer bound to certain territorial locations. *Technoscapes* consist of highly mobile (and mobilizing) technologies, particularly new information and communication technologies, facilitating the movement of information, images, and sounds at high speeds across unlikely parts of the world. *Financescapes* refer to the transnational culture associated with global financial markets and mobile forms of capital. *Mediascapes* consist of the movement of information throughout the world and to the images of the world created by the global media and culture industries. Finally, *ideoscapes* are the global flows of ideologies, both of states and of political-social movements explicitly oriented to capturing state power, or a piece of it.

Scapes, by analogy to landscapes, are given material shape and meaning by human action. They are the results of global processes at any given time but are not the processes themselves. The processes are specifiable "flows" (e.g., mobilities and relations). The sheer speed, scale, and volume of these flows are so great that the disconnections they produce have become central to the politics of global culture. The visual metaphor of scape signifies how flows are understood from the perspectives of sociohistorically situated groups and individuals. It points to the fluid, irregular relationship between the local and the translocal. Far from providing a rigid taxonomy, the various scapes indicate that these are not objectively given relations that look the same from

every angle of vision but, rather, deeply perspectival constructs, inflected by the historical, linguistic, and political situatedness of different sorts of actors: nation-states, multinationals, diasporic communities, interest groups, villages, neighborhoods, families, and individuals.

As Henrietta Moore has noted, the notion of scape as a metaphor explicitly moves away from part-whole relationships. One of its great strengths is its commitment to the idea of flow, processes, interconnections, experiences, and imagination at the expense of units, entities, systems, and subsystems. Far from being mutually exclusive, scapes and flows continually intersect, with the former providing a partial structure—a global order—within which fluidity can emerge and thrive. Whereas Appadurai's original theory assumes that static units are the opposite of flows, Heyman and Campbell propose a processual geography to understand how flows can create, reproduce, and transform geographic spaces. Rather than seeing flows as disconnected and thus implying causal equality among different scapes, Hayman and Campbell give greater weight to flows of capital, especially financial capital, and to a lesser extent to centralized political power, than to other flows and scapes. This elaboration of Appadurai's model moves beyond a list of globally settled scapes, paying more attention to global inequalities and the continuing importance of boundaries.

In sum, the notion of scapes offers a useful tool to analyze the complex play between fluidity and fixity in global cultural flows, in a context where physical borders no longer necessarily sustain locality. The contribution of scapes is that they provide an alternative spatial conceptualizing of the present. By using the notion of scapes, we can explore the dynamics of various place-making flows, from the personal to the institutional and from the local to the national, transnational, global, and diasporic. Appadurai is to be credited with introducing this concept in anthropology. His model not only offers multiple flows and scapes but also insists on their empirical and analytical separation. This is particularly helpful in opening up multiple approaches to the study of global mobilities. With the loss of place as a dominant metaphor for culture goes a methodological redirection from order to nonorder, which allows anthropologists to capture not only mobilities in the landscape but also the processes of deterritorialization and reterritorialization that these mobilities involve.

Schapera, Isaac

Isaac Schapera (1905–2003), the South Africa–born anthropologist, compiled the richest and most authoritative body of ethnographic work on the Tswana people of Botswana and played a key role in developing anthropological perspectives on social change.

Biography and Major Works

A child of immigrant Jewish parents, Schapera was born in a small town in the arid northern region of Cape Colony, South Africa, where there was a large population of indigenous Khoekhoe people. He enrolled at the University of Cape Town with an intent to study law, but an interest in early European travelers' accounts of southern Africa led him to pursue a master's degree in anthropology under A. R. Radcliffe-Brown. In 1926, he joined the London School of Economics (LSE) to pursue a doctorate under the supervision of C. G. Seligman and was one of a group of students at the LSE who went on to pursue outstanding careers (Raymond Firth, Audrey Richards, E. E. Evans-Pritchard, Gordon Brown, and Lucy Mair, among others). Returning to teach in South Africa in 1930,

Schapera played key roles at the University of the Witwatersrand and subsequently at the University of Cape Town in training numerous prominent scholars and promoting the study of Africa in South African universities.

Schapera returned to the LSE in 1950 as chair of the Department of Anthropology, where he played an important part in the institutional development of anthropology and African studies in the United Kingdom and the British Commonwealth. Schapera retired from the LSE in 1969, having been instrumental in transforming anthropology from a small-scale movement of intellectuals in the 1920s and 1930s into an established profession.

Schapera was an enormously prolific scholar. In 1930, he published *The Khoisan People of South Africa*, the first synthetic study of the Khoekhoe. From 1928 to 1943, he carried out a comprehensive set of ethnographic studies of the Tswana in the Bechuanaland Protectorate (now Botswana). This meticulously documented corpus of work, together with his unpublished field notes and carefully annotated genealogies, has served as a point of reference for all later scholarship on the Tswana. Schapera's *Handbook of Tswana Law and Custom* (1938) is a recording of "customary" legal practices commissioned by the government at the request of chiefs who were concerned that the next generation of chiefs would be unfamiliar with these practices. Judicial authorities in Botswana continue to make reference to the *Handbook* in their rulings. *Migrant Labour and Tribal Life* (1947) documents the impact on economic and kinship arrangements of the large-scale migration of young men to South African mines and farms. Schapera's ethnography *Married Life in an African Tribe* (1940) is a candid presentation of sexuality and gender relations in the village of Mochudi, where labor migration, economic hardship, and the modernizing efforts of chiefs and Christian clergy were bringing about rapid transformations. Schapera also carried out historical work, editing and publishing the papers of the 19th-century British missionaries Robert and Mary Moffat and David Livingstone.

Critical Contributions to Anthropology

Schapera routinely disclaimed interest in anthropological theory, preferring to consider his work as describing social situations as he encountered them. Nonetheless, his approach to ethnographic description was itself revolutionary in that it focused on social change. Bronisław Malinowski, one of Schapera's teachers in his early years at the LSE, had promoted analyses of "traditional" social life that tended to overlook the effects of missionary Christianity and global capitalism. Schapera turned away from this approach at an early point, arguing that missionaries, traders, administrators, chiefs, commoners, and diviners had to be considered parts of a single social system. This theoretical approach had political significance in the context of the segregationist and, later, apartheid policies in South Africa, whose anthropological promoters concentrated on describing African groups in isolation from political and economic contexts. Schapera's focus on what he termed the "whole structure" of social life helped indirectly to inspire later generations of anthropologists to focus on world systems of production and consumption. More immediately, Schapera's documentation of inadequate land bases for African farmers and the disruptive effects of labor migration provided important empirical data for discrediting the intellectual premises of apartheid, namely that "White" and "Bantu" were separate cultures that were to "develop along their own lines."

Schapera's book *Tribal Innovators: Tswana Chiefs and Social Change 1795–1940* (1970), a revision of work composed in the 1940s, exemplifies his focus on the contingent acts and processes that give rise to social changes. The book documents the decisions chiefs made to discontinue initiation rites, ban polygyny, and build schools. Schapera's historical awareness led him to trace current arrangements to contingent decisions made by particular persons. While this approach to historical change had largely fallen out of anthropological fashion at the time of publication, when Marxist approaches predominated, the book reflected the empirical grounding Schapera brought to his descriptions of change.

Schapera's Legacy

Schapera's name is renowned in Botswana, where he is widely recognized as a recorder of histories and practices that might have been largely forgotten but for his efforts. Schapera made outstanding contributions to the development of literature in the Setswana language. Two Setswana texts on laws

and tribal histories published by Schapera in 1938 and 1940 are used in the Botswana school system. Schapera's *Praise-Poems of Tswana Chiefs* (1965) records the recollections of elders in the 1930s of the oral poetry composed to praise and criticize chiefs as far back as the 17th century. This text also is widely read and admired in Botswana today. Finally, Schapera's legacy rests on the large number of prominent Africanist scholars whom he helped train and with whom he shared his voluminous research notes.

Scheper-Hughes, Nancy

Nancy Scheper-Hughes (1944–), professor of anthropology at the University of California, Berkeley, is a prominent and prolific scholar known for her work in critical medical anthropology, her courageous fieldwork and exploration of ethics, her public exposure of criminal activities taking place in human organs trafficking, and her evocative anthropological writing. In her anthropological career, she has examined schizophrenia among rural bachelors in Ireland, hunger, impoverishment, child mortality, the violence of everyday life in rural Brazil, and structural violence and health inequities evident in human organ trafficking in Moldova, Israel, South Africa, and the United States. Her writings and her mentorship have launched generations of inspired anthropologists, both in the United States and globally. Overseas, she has given dozens of keynote addresses on violence, human trafficking, organized crime, dangerous and endangered youth, heretical methods, and undercover research. Scheper-Hughes is one of the most influential anthropologists of the past 30 years.

Biography and Major Works

Scheper-Hughes was born in an ethnically diverse working-class neighborhood in Brooklyn, New York, where she attended a Catholic school and then Queens College before joining the Peace Corps. After serving in the Peace Corps in Brazil in the early 1960s, Scheper-Hughes returned to the United States and participated in the Catholic Worker Movement and in civil rights organizations working in the U.S. South. She completed her undergraduate and doctoral degrees at the University of California at Berkeley under the tutelage of the anthropologist Hortense Powdermaker. After teaching briefly at Southern Methodist University, she was invited to return to Berkeley and has remained there since. In the course of her career, Scheper-Hughes has authored or edited at least 10 books and more than 160 scholarly articles.

Scheper-Hughes is the recipient of many grants, awards, and book prizes, including a Guggenheim Fellowship, the Margaret Mead Award, the Staley Prize, the Wellcome Medal from the Royal Anthropological Institute, and the William Sloan Coffin Award for moral leadership. Scheper-Hughes has taught in Paris, Manchester, and Cape Town and is a frequent keynote speaker at institutions and conferences across the globe. At Berkeley, she has served as chair of the anthropology department, interim director of Latin American studies, director of the doctoral program in medical anthropology, and dean of the division of freshman and sophomore studies. She is currently Chancellor's Professor of Medical Anthropology and the cofounder and director of Organs Watch, an organization that grew out of the Bellagio Task Force; she monitors the social and economic organization of the organs trade and advocates for the human rights of populations made vulnerable by this activity. She also serves on the World Health Organization advisory panel on global transplant safety and ethics and is a member of the Asian Task Force on Combating Traffic in Humans for Organs.

Her first book, the 1979 *Saints, Scholars and Schizophrenics: Mental Illness in Rural Ireland*, won the Margaret Mead Award in 1980. Scheper-Hughes's book caused a stir; the residents of the small village

of An Clochán took offense at what they saw as a public airing of community secrets. Scheper-Hughes eventually reflected on her Ireland research experience in a number of articles, exploring the contours of how anthropology is—whether it wants to be or not—centrally engaged in a number of ethical pursuits. Scheper-Hughes has argued that anthropologists ought to be scribes, witnesses, cultural critics, friends, and collaborators in pursuit of diverse forms of social justice and that much of our activity will be—even should be—controversial. Scheper-Hughes's own work has evolved to advocate for different, and increasingly radical, approaches to methods and ethnographic writing—beginning with "good enough," progressing to "militant," and, more recently, speaking to "heretical" methods—referring to her undercover work with the police and prosecutors in Brazil, Turkey, South Africa, and the United States to prosecute illicit networks of human traffickers.

Her second major book, *Death Without Weeping: The Violence of Everyday Life in Brazil*, published in 1992, is an internationally recognized *tour de force*. A classic in anthropology and seminal in the fields of medical anthropology and the anthropology of Brazil, *Death Without Weeping* won the Staley Prize from the School for American Research and was a finalist for the National Book Critics Circle Award, a rare achievement for an academic publication. The book communicates the historical conditions—specifically, colonialism, the slave trade, and the sugar trade—that transformed vast parts of northeast Brazil into a land of hunger seemingly abandoned by modernity, a region where impoverished mothers are cared for neither by the state nor by the political-economic system that sustains brutal inequalities. Scheper-Hughes argued that in these circumstances some mothers are unable to care for their children and must ration their emotional and economic resources in favor of those who appear to have a knack (*jeito*) for life. *Death Without Weeping* politicized generations of anthropologists to use their expertise to bring social injustices to light, using ethnographic writing to examine and advocate for those who are less powerful.

Critical Contributions to Anthropology

Scheper-Hughes's contributions to anthropology build on and deepen themes first developed in her earlier ethnographic work. For example, following the themes first developed in *Death Without Weeping*, Scheper-Hughes (and coauthor Philippe Bourgois) redefined anthropology's understanding of human violence, broadening the definitions and the outlines of what contemporary anthropology can address; Scheper-Hughes has developed multiple foci for studying violence, including the everyday, medical-psychiatric, symbolic, and political aspects that have pushed anthropologists to comprehend violence in a much broader and philosophically relevant perspective.

In her more recent work, Scheper-Hughes has uncovered criminal aspects of the global traffic in humans for their transplantable organs and tissues. This work not only speaks to the ways in which the world's poor are once again treated as disposable but also points to how trafficking illuminates human approaches to death and dying. Scheper-Hughes intends to elaborate fully on this work in two projected books, the first on the global traffic in organs and the second on the Argentine "dirty war" of the 1970s and 1980s. Scheper-Hughes has written a number of seminal articles on themes that build on her earlier work. For example, in "The Mindful Body: A Prolegomenon to Future Work in Medical Anthropology," Scheper-Hughes and Margaret Lock examine how medical anthropology might better conceptualize the body as tripartite, as (1) phenomenally experienced, (2) socially constructed and symbolized, and (3) created as an artifact of social and political control. In Scheper-Hughes's research tracking the global traffic in human organs, she extends this tripartite extension to include the idea of a body in debt under conditions of late capitalism and the divisions among and between the global rich and poor. In particular, she explores the idea of neo-cannibalism, the possibility that because of economic inequalities, body parts are made available in ways that suggest that the poor are being exploited for their organs. This idea is also visible in her earlier work in *Death Without Weeping*, where the poor and disenfranchised of the community she studied believe that their body parts and organs are being snatched for medical research and profit, a rumor with historical grounding that Scheper-Hughes later came to document.

Scheper-Hughes's Legacy

Scheper-Hughes is a militant and critical medical anthropologist, known for her ability to debate

and write both persuasively and with great wit. She advocates for the transformative capabilities of anthropological writing and has a large following of admirers both within anthropology and far beyond. In a memorable debate that took place on the pages of *Current Anthropology*, titled "The Primacy of the Ethical: Propositions for a Militant Anthropology," Scheper-Hughes sets out the parameters of what an ethically grounded anthropology might look like, critiquing the idea that cultural relativism can be appropriately applied in contemporary anthropological settings that require new and much bolder forms of political and social commitments. A provocative interlocutor and courageous field-worker, Scheper-Hughes has produced an influential oeuvre that attempts to rattle anthropological complacency and to make anthropology intellectually vibrant and politically relevant, while producing new engagements for anthropology within a broader public.

Schneider, David M.

David Murray Schneider (1918–1995) was one of the most influential American anthropologists of the middle to late 20th century. He made important contributions to Micronesian ethnography and the understanding of marital alliance. With Clifford Geertz, he pioneered what came to be called "symbolic" or "interpretive" anthropology. From the 1960s through the mid-1970s, he was a powerful force in the University of Chicago's anthropology department. He was instrumental in founding the Association for Social Anthropology in Oceania. Beginning around 1970, he was responsible for deconstruction of kinship as a cultural category and, thereby, became arguably the most important precursor of postmodernism in American anthropology.

Early Life and Education

Schneider was born in Brooklyn, New York, in 1918. His parents were Eastern European immigrants and, during the Great Depression, members of the American Communist Party, who passed their leftist sympathies on to their son. David respected his father but had a difficult time with his mother and resented his younger brother. In an act of rebellion, he performed poorly in school, leading his parents to send him to a boarding school in Darien, Connecticut. After high school graduation, he entered Cornell University. He planned to study agricultural bacteriology but changed his major to anthropology after being introduced to the subject by R. Lauriston Sharp. At Cornell, he met his lifelong friend—and intellectual adversary—Ward Goodenough, as well as his future wife, Addy. David and Addy married on June 17, 1940, the day of their Cornell graduation.

After earning an MA at Cornell, Schneider joined Goodenough at Yale. There, he briefly studied psychoanalytic anthropology with Geoffrey Gorer, who introduced him to Margaret Mead. Before completing his degree, he was drafted into the army. His notes on the experience led to the publication of his first two articles, "The Culture of the Army Clerk" and "The Social Dynamics of Physical Disability in Army Basic Training."

Contributions to the Study of Kinship

On his discharge, Schneider entered Harvard's doctoral program in social relations, where he worked with Clyde Kluckhohn and the sociologists Talcott Parsons and George Homans. In collaboration with Kluckhohn and Henry Murray, he edited his first book, *Personality in Nature, Society, and Culture*, an important collection of essays in psychological anthropology. Fieldwork on the Micronesian island of Yap in 1947–1948 led him to consider kinship and conclude that his predecessors—W. H. R. Rivers, A. R. Radcliffe-Brown, George Peter Murdock, and others—had been fundamentally mistaken about kin terms.

Schneider's dissatisfaction with previous approaches to kinship led to a career-long preoccupation with the American kinship system. In his first publication on the topic, coauthored with Homans, he challenged the conventional distinction between vocative and referential kin terms (i.e., between terms like *dad*, which are used when directly addressing a relative, and terms like *father*, which are used when referring to a relative in the third person) and noted the variety of terms applied to relatives (e.g., *papa* and *old man*), many of them outside the realm of what anthropologists typically recognize as "kin terms." His critical approach ultimately led him to conclude that the definition of kinship was, itself, problematic.

Schneider's collaboration with Homans led to his first major public controversy. In *Marriage, Authority, and Final Causes*, Homans and Schneider disputed Claude Lévi-Strauss's explanation for the predominance of matrilateral over patrilateral cross-cousin marriage. Earlier, Radcliffe-Brown had noted a tendency for men in patrilineal societies to marry their mothers' brothers' daughters. He attributed this to a warm, emotionally close relationship in many patrilineal societies between a man and his sister's son, and suggested that a boy's sentimental attachment to his maternal uncle is transferred to the uncle's daughter. Since patrilineal societies are more common than matrilineal ones, matrilateral cross-cousin marriage is more common than the patrilateral variant.

In *The Elementary Structures of Kinship*, Lévi-Strauss argued (contra Radcliffe-Brown) that a cultural phenomenon such as unilateral cross-cousin marriage cannot be explained in terms of individual sentiments. Instead, he proposed that a rule directing men to marry their matrilateral cross-cousins is, for structural reasons, more productive of social solidarity than the reverse. His explanation works equally well with matrilineal or patrilineal descent and is, therefore, not tied to statistical vagaries.

Homans and Schneider objected that Lévi-Strauss had presented a final cause—that matrilateral cross-cousin marriage exists because it is "good for society." However, marriage is contracted by people, not societies, and Lévi-Strauss had said nothing about why a man would want to marry his matrilateral cross-cousin. The answer to that question, they contended, requires a search for an efficient cause, and for that, one must return to individual sentiments.

In 1962, Rodney Needham responded to Homans and Schneider with the publication of *Structure and Sentiment*. He argued that *The Elementary Structures* was about prescriptive rather than preferential marriage systems; and if a man had no choice but to marry his matrilateral cross-cousin, individual sentiments were irrelevant.

Schneider replied in 1965 by disavowing the central argument of his book with Homans but asserted that Needham was equally mistaken. From a structural viewpoint, he declared, it makes no difference how rigidly a rule is enforced; what matters is the rule's existence. Lévi-Strauss, he claimed, chose not to distinguish between prescriptive and preferential marriage systems because the difference is irrelevant to his argument. Four years later, Lévi-Strauss proclaimed in his preface to the English edition of *Elementary Structures*—whose translation had been overseen by Needham!—that Schneider was correct.

Culture as a Symbol System

Meanwhile, Schneider worked to refine the culture concept developed by Alfred Kroeber, Kluckhohn, and Parsons. Central to their view was culture's

separation from the biological organism, individual psyche, and social system. Notably, whereas the social system comprises patterns of behavior, culture is a system of meanings and symbols. Like language, it is an underlying code shared by a community's members. Just as knowledge of a language does not tell us what anyone will say, to understand a culture does not tell us what someone will do. People immersed in different cultures may act similarly for different reasons, and people sharing the same culture may behave quite differently if their situations differ.

Schneider defined culture as a system of symbols, and a symbol as anything that represents something else, where there is no necessary relationship between the representation and that which it represents. Since symbols are arbitrary social constructs, the existence of a symbol in one community does not ensure that it will be recognized in any other. Whether any construct exists cross-culturally is an empirical question; therefore, cultural documentation requires listening to one's informants and avoiding prior assumptions.

American Kinship

Perhaps Schneider's most widely cited book is *American Kinship: A Cultural Account*. It resulted from a survey of kin term use among Chicago residents. More important, it was intended to illustrate Schneider's idea of how to conduct and present a culturally sound ethnography. He attempted to eliminate prior assumptions, identify the meanings and symbols through which members of the community define their cultural units, and use his interpretive insight to discover the order underlying his informants' worldview. His analysis differed from the commonsense perspective held by most Americans, but it was intended to make their commonsense perspective intelligible to the critical observer.

Schneider argued that Americans use biological relatedness as a symbol in terms of which kinship is defined and differentiated from other cultural domains. The application of that symbol, however, is not dictated by biogenetic reality. People with no biogenetic relationship may be considered kin, while others who are biologically related may be denied kinship status.

American culture, Schneider proposed, encompasses two great orders, which he termed "nature" and "law." Kinship, he said, is unique in that it partakes of both. Its distinctive features are shared natural or biogenetic substance (order of nature) and a code for conduct involving diffuse and enduring solidarity (order of law). Americans speak of the first in terms of "blood" and the second by using expressions such as "relationship" and "love." The core symbol holding everything together is sexual intercourse, through which husband and wife express their love for one another, thereby creating a "relationship in law." In the process, they join their biological substance to create new relatives "by blood." Love between blood relatives such as parent and child is "cognatic love" and excludes sexual relations, which would be incest. Love between husband and wife is "conjugal love" and receives its highest expression in the act of "making love."

Where both biogenetic substance and diffuse, enduring solidarity are present, the relationship is clearly one of kinship. If only one component is present, one may or may not consider the person in question to be kin, and both positive and negative designations are correct according to the definitions and symbols that constitute American culture. "In-laws," for example, are expected to adhere to the appropriate code but not to share biogenetic substance. Therefore, Americans are divided as to whether or not in-laws are relatives. Similarly, adoptive relatives, characterized by solidarity but not shared substance, are sometimes differentiated from "real" relatives and sometimes considered to be "real relatives" of a special type. By contrast, a "natural" relative, such as a woman who gives up her child for adoption, shares biogenetic substance with the child but not diffuse, enduring solidarity. Americans may say that the woman is the child's mother because the natural relationship cannot be severed, or they may deny the mother-child relationship because the woman is not acting in a "motherly" way.

Schneider's argument that Americans define kinship in terms of an interplay between shared substance and diffuse, enduring solidarity led, a short time later, to his infamous contention that kinship as a cultural category does not exist at all.

Deconstruction of Kinship as a Cultural Category

Shortly after *American Kinship*'s publication, Schneider took his 1968 conclusions in unexpected

directions. In 1969, he announced that kinship, nationality, and religion in American culture are all defined in terms of shared substance (which he now termed "natural" rather than "biogenetic") and diffuse, enduring solidarity. However, if three cultural domains share the same defining features, then those features do not distinguish any one of them from the other two. And if the three domains are indistinguishable from one another, not one of them deserves the label "kinship." In 1972, he added that since kinship is an English word, if the category were to exist in any culture it should be in America's. Since kinship does not exist in American culture, Schneider argued, it does not exist in any culture anywhere. His last major work, *A Critique of the Study of Kinship*, explored the implications of kinship's nonexistence and how the illusion of its existence had distorted cultural analysis throughout the discipline's history.

Schneider's deconstruction of kinship as a cultural category discouraged others from pursuing the subject, and the past decades of the 20th century saw little research and publication in that area. However, by freeing kinship from its former biological constraints, he opened doors for feminist and gay anthropologists, and largely through their work, the subject has become reenergized in recent years.

In 1986, 2 years after the publication of his *Critique*, Schneider retired from the University of Chicago. He joined the anthropology department at the University of California, Santa Cruz, and remained there until his death a decade later.

Seligman, Charles Gabriel

Charles Gabriel Seligman (1873–1940) was a dedicated field-worker *par excellence* who laid the foundations of scientific ethnology in eastern New Guinea and Southern Sudan. By the early 1920s, he had conducted exploratory fieldwork in more locations than any other British anthropologist, and his detailed ethnographic documentation of hitherto undescribed peoples is an invaluable legacy. At the London School of Economics, he played a major role in the establishment of academic anthropology in Britain after World War I. As president of the Royal Anthropological Institute in 1923–1925, he increased its membership and enhanced its status as a repository of anthropological knowledge.

Born in London, the only child of a Jewish wine merchant, Seligman was a reclusive boy who found consolation in nature study and chemical experiments. Blessed by a keen aesthetic sensibility, his

early enthusiasm for butterfly collecting foreshadowed a lifelong passion for collection and classification, exemplified in later years by the delight he took in his private collection of early Chinese ceramics and bronze ware.

After qualifying in medicine in London, Seligman specialized in pathology, and his earliest publications were on tropical diseases. An interest in physical anthropology prompted him to persuade A. C. Haddon of Cambridge University to allow him to join the Torres Straits Expedition of 1898. Like most other members of this epoch-making expedition, Seligman approached anthropology as a biological scientist. While collecting data on medical conditions, he investigated curing practices and customs related to girls' puberty. He assisted W. H. R. Rivers's psychophysiological testing of the Islanders, and through firsthand experience of the methods Rivers used for sociological inquiry, he conceived an enthusiasm for ethnographic research.

Although he continued pathology research in London for several more years, the attraction of ethnographic fieldwork was irresistible. (As he once told his distinguished pupil Bronisław Malinowski, fieldwork is to anthropology what the blood of the martyrs is to the Church.) In 1904, Seligman led a three-man expedition to British New Guinea (later Papua New Guinea). From the Gulf of Papua in the west to the insular Massim in the east, he surveyed groups of coastal peoples, whom he classified in ethnological terms according to geographical, physical, linguistic, and cultural criteria. Although the main source of his data was native informants whom he interviewed through local interpreters or Pidgin English, his eclectic method was to assemble material from every available source, including government officers and missionaries. He devoted a monograph to each of the several groups he had studied, before integrating them into a single volume. *The Melanesians of British New Guinea* (1910) is an ethnographic compendium of vast comparative scope that established Seligman's reputation as a professional anthropologist.

In 1905, Seligman married Brenda Z. Salaman, who became his constant companion, a co–fieldworker and coauthor, as well as the mother of their two children. At Haddon's suggestion, the couple traveled to Ceylon (now Sri Lanka) to study remnant populations of Veddas, believed to be the island's aboriginal inhabitants. Reclusive hunters and honey gatherers, Vedda men jealously protected their womenfolk, so Seligman's only access to domestic life was through his wife. Under his tutelage, she became an accomplished ethnographer in her own right, acknowledged in their joint publication *The Veddas* (1911), a work of lasting historical value. Subsequently, Brenda Seligman published many theoretical articles on kinship and marriage, and although she never held an academic position, her anthropological career was crowned in 1959 by her election as president of the Association of Social Anthropologists.

Following his appointment in 1913 to the foundation chair in ethnology at the London School of Economics, Seligman taught and mentored a generation of cosmopolitan pupils, including Malinowski, Raymond Firth, E. E. Evans-Pritchard, Isaac Schapera, and Meyer Fortes, all of whom testified to his extraordinarily generous intellectual, moral, and financial support.

Like Haddon at Cambridge and R. R. Marett at Oxford, in addition to his regular teaching, Seligman offered professional training to British colonial officers bound for India or Africa. In 1915, he was commissioned in the Royal Army Medical Corps and joined Rivers in treating hospitalized shell-shocked soldiers. This harrowing work fostered a new understanding of human behavior under extreme stress and, along with his reading of Sigmund Freud and Carl Gustav Jung, fostered in Seligman an interest in psychopathology and the unconscious. Somewhat unfashionably, he maintained that psychoanalysis shed comparative light on folklore, mythology, and typical dream imagery—a topic he explored in his 1932 Huxley Memorial Lecture.

After their fieldwork among the Veddas, the Seligmans' partnership continued, with three government-sponsored expeditions to the Anglo-Egyptian Sudan between 1909 and 1922. These arduous pioneering field trips ventured into ethnographically uncharted regions. They systematically recorded the physical anthropology, prehistory, social organization, religion, and mortuary practices of many tribes, such as the Nuer, Dinka, Shilluk, Bari, Lotuko and Nuba, some of them incompletely "pacified." They investigated also several nomadic Arab tribes, notably the Kababish of Kordofan. Over a period of 2 decades, the Seligmans published their extensive research in articles and monographs, culminating in *Pagan Tribes of the Nilotic Sudan* (1932), a monumental conspectus that guided subsequent studies

of the region, notably by two of Seligman's own pupils, Evans-Pritchard and Siegfried Nadel. It was preceded by *Races of Africa* (1930), an ethnological synopsis of the continent that served as a standard reference text for 40 years.

In 1929, Seligman and his wife visited China and Japan, and his research during this and subsequent visits resulted in a number of publications on glass, porcelain, and bronze objects characteristic of Chinese and cognate civilizations. Troubled by poor health, Seligman resigned his London School of Economics professorship in 1934 but continued to publish and lecture on a variety of topics. In 1938, he accepted a 6-month visiting professorship at Yale University, and at the time of his death, he was assembling material for a book on the art of the Massim.

Seligman's wide-ranging interests extended to every branch of anthropology except linguistics. In addition to his seminal contributions to descriptive ethnography, he published on historical ethnology, physical anthropology, cross-cultural psychology, material culture, Egyptian archaeology, and Chinese antiquities. As an indefatigable collector of data, he insisted on empirical rigor and systematic documentation. His ethnological researches concerned with tracing prehistoric migrations and cultural diffusion in both New Guinea and Africa were conducted with scrupulous attention to factual evidence, and he rejected the fanciful conjectural reconstructions of Rivers and G. Elliot Smith. He was similarly skeptical of the evolutionists' search for origins. The functionalist doctrine promoted by Malinowski also failed to engage him (for his part, Malinowski disparaged Seligman's interests as "antiquarian"). Seligman's temperament and biological training inclined him to focus on facts, and he was uncomfortable with theoretical speculation; he preferred to deal with things that could be measured and classified. Among his many honors, Seligman was elected to the Royal College of Physicians in 1911 and to the Royal Society in 1919; he was awarded the Rivers Medal in 1925 and the Huxley Medal in 1932.

SEMIOTICS

Semiotic theory has had an important impact on sociocultural anthropology during the last half of the 20th century and into the new millennium. Semiotics provides a way to study communication focusing not only on spoken or written language but also on all kinds of communicative signals or "signs." (That is why the field is called *semiotics*, based on the Greek words for signs and significance.) For example, when people communicate with each other, they may use gestures or intonation patterns as well as words to convey ideas. Semiotics provides an integrated framework for examining these as they operate together in conveying meaning. Or, to take another example, a semiotic analysis of law could encompass not just the written and spoken words of judges, lawyers, and litigants but also the physical configurations of courtrooms, jails, and other locations in which the law operates. The way judges and litigants dress, the symbols used in courtrooms to depict ideas of justice or national identity, and so forth, can all become part of a semiotic analysis. This combination of many aspects of communication has been particularly powerful for anthropologists.

Sociocultural anthropology in particular has struggled to find analytic approaches capable of dealing with both material life and symbolic or cultural meaning. Semiotics opened up an opportunity for anthropology to bridge these aspects of human life because it permits researchers to analyze everyday practices, material conditions, symbolic systems, culture, and language as inextricably linked parts of human experience. At the same time, the

development of semiotic approaches within anthropology also permitted sociocultural anthropologists to draw on the precision of anthropological linguistic analysis, and it allowed linguistic anthropologists to embed their analyses of language within the study of wider social phenomena. Thus, semiotics has forged new links between the subfields of linguistic and sociocultural anthropology.

A Brief History of Semiotics in Anthropology

Beginning in the early 1960s, the French anthropologist Claude Lévi-Strauss brought semiotics into the anthropological mainstream, drawing on the work of the linguists Roman Jakobson and Ferdinand de Saussure. Saussure (who used the term *semiology* rather than *semiotics*) had developed a powerful analysis of signs by focusing on the structural features of language. Saussurean linguistics distinguished between the abstract structure of language (*langue*—think of a grammar book, e.g., or the way sounds combine to make words) and the realization of that abstract structure through spoken language (*parole*—think of someone actually saying something).

Saussure focused on the way structured oppositions or differences in language generated meaning. Within the abstract structure of language, for example, meanings sometimes emerge through the presence or absence of certain features like sounds. Thus, English speakers distinguish between the words *but* and *bud* on the basis of a very small difference in the final sound. (Linguists would call this a difference in "voicing," where "t" is not voiced but "d" is; if you put your hand on your throat while saying these two words, you can feel this difference.) On the other hand, the very same difference in sound does not cause a change in meaning if it occurs after an initial *s* in English: We do not think of *stop* and *sdop* as meaning two different things. Thus, the internal relationships of sounds to one another in languages create differences in meaning. (This would be called a system of *phonemes*, or meaningful sound differences.) In the example above, the presence (+) or absence (–) of voicing can be analyzed as a contrastive set. Variation in meaning depends not only on whether voicing is present or absent but also on the position of a particular sound vis-à-vis other sounds (does it follow an "s" sound at the beginning of a word in English?).

Saussure's structural account of language meaning also relied on a dichotomy between the *signifier* (the form the sign takes—so, e.g., the sounds that make up the word *horse*) and the *signified* (this would be the *idea* that we get from hearing the word—in the previous example, an image or idea of a horse). Note that this theory does not include any mention of the objects in the world to which these signs refer; the "signified" is not any particular real horse, but it is rather the idea of a horse that a listener forms when hearing the word *horse*. A signifier and a signified together form an individual *sign*, which gets its meaning through its structural relationship with other signs. As we have seen in the example above, structured variations in sounds in the signifier create variations in the signified.

Lévi-Strauss applied Saussure's model of structured system-internal differences in language meaning to the wider arena of cultural signaling in general. For example, he analyzed elements of myth (*mythemes*) as contrastive components whose opposition created cultural meaning, arguing that this was parallel to the way phonemes or sounds generate linguistic meaning. Lévi-Strauss learned about Saussure's approach to analyzing language while studying with another famous linguist, Roman Jakobson. However, Jakobson took the position that there are important differences between the relatively clear (and internally structured) sound systems through which language works and the much messier (and contextually dependent) remainder of language. Jakobson was a member of the Prague school of linguists (or Prague Linguistic Circle), a group that stressed the importance of language *function* as opposed to only examining language form. They also urged that linguists study language as dynamic and changing over time (this was called a *diachronic* perspective, as opposed to the static, one-time [*synchronic*] snapshot that they viewed—some would argue mistakenly—as characteristic of Saussure's approach).

Lévi-Strauss's version of semiotic anthropology was criticized because it ignored many important differences between sound systems in language and broader structures of meaning in society. When we move from the difference between "t" and "d" (phonemes) to the difference between killing one's father and killing one's mother (mythemes), we run into many more aspects of context and shades of meaning. How we define mythemes is much less

straightforward than how we define voicing. In addition to this difficulty, structuralist approaches that focused on abstract systems of phonemes and grammatical categories within *langue* wound up missing the importance of *parole*, or the actual act of speaking. This was not only true for sociocultural anthropologists interested in social and cultural phenomena generally, it also applied to linguists who sought to understand only language in particular; as it turns out, grammar and abstract linguistic structures are only a small part of how language itself conveys meaning. In subsequent generations, both semiotic anthropology and anthropological linguistics moved on to do a better job of including the "in-action" aspects of language, society, and culture.

During the 1970s and 1980s, semiotic anthropology once again began to attract attention as it reemerged in new forms. The clearest call for a "semiotic anthropology" came from the work of Milton Singer and his colleague at the University of Chicago, Michael Silverstein. Like Lévi-Strauss, Singer drew on Saussurean linguistics, but he added a new element by also looking to the work of the semiotician Charles Sanders Peirce. Singer felt that Peirce's work would offer anthropology an important tool for linking the analysis of meaning to its social context.

Peirce's theory of signs included a component not found in Saussure's work. Like Saussure, he was interested in the form of the sign (what he called the "sign vehicle" or *representamen*) and the idea created in a listener's mind by hearing or reading that sign vehicle (what he called the *interpretant*). However, he also required that semiotic analysis include the study of the sign's "object"—the thing or concept that the sign stands for. Signs stand for their objects in different ways. For example, an architect's model of a planned building stands for that building by virtue of having a similar shape. Peirce called this kind of connection between sign and object *iconic*. Some signs, by contrast, signal their objects by virtue of having a spatiotemporal connection with them. An example of this kind of *indexical* or *pragmatic* relationship would be the connection between a pointing finger and the object to which the finger points. (The indexical connection is accordingly the most heavily dependent on immediate contexts.) Finally, some signs stand for their objects just by virtue of convention that makes it so: Most words have this kind of relatively arbitrary connection to their objects. For example, the sounds in English that make up the word *chair* have come to indicate the items of furniture that we sit on just because of linguistic convention. Peirce labeled this kind of conventional connection *symbolic*. (It is also referred to as *semantic* meaning, in contrast with the more heavily contextual *pragmatic* meaning.) Thus, signs can be icons, indexes, or symbols depending on the manner in which they connect with their objects.

In the new form of semiotic anthropology that emerged in the 1970s and 1980s, Singer and Silverstein combined Saussure's focus on language structure, on the one hand, with Peirce's interest in how signs connect with their objects, on the other. Their work demonstrated that Peirce's theory could push scholars to integrate issues of social context more systematically into the analysis of meaning, by requiring us to consider the relationship of sign vehicles and interpretants with their objects. Including Peirce's framework in a semiotic analysis, then, permits us to encompass but also move beyond studying the internal system of language. Through integrating the study of indexicality and pragmatics with other aspects of communication, a semiotic anthropology could now analyze not only the words people speak but also how, when, and where they talk—in other words, the entire sociocultural world opens up to this form of analysis.

Semiotic anthropology gained momentum during the 1980s and 1990s, drawing together multiple threads of work from various anthropological and other scholarly traditions. The work of the anthropological linguist Michael Silverstein, in addition to blending Saussure, Peirce, and Jackobson, drew on diverse roots from linguistics, psychology, analytical philosophy, anthropology, semiotics, sociolinguistics, cognitive science, and literary theory, building a framework for empirically grounded research on communication in social contexts. Semiotic anthropology as it developed also integrated the accumulated empirical knowledge of research on language in context from sociolinguistics, ethnomethodology, discourse analysis, conversation analysis, and approaches like frame analysis, derived from Irving Goffman's work. For example, the sociolinguist John J. Gumperz used the concept of "contextualization cues" to study the way speakers use verbal and nonverbal cues to index their contexts of speaking. Semiotic anthropologists have drawn on the idea of contextualization cues in studying the indexical

and pragmatic aspects of cultural communication. Indeed, as we will see, there is considerable overlap between the anthropological-linguistic and the sociolinguistic approaches.

Proposals for a renewed semiotic approach in anthropology proliferated during the last decades of the 20th century, including a suggested focus on the crucial role of "semiotic mediation" in society. This focus highlighted the ways in which signs and language mediate at many levels, from the basic mechanics of everyday interaction through the complexities of psychological development and of the dynamics of whole societies and cultures. On the one hand, these proposals drew from a long history of anthropological research on cultural symbols dating back to Franz Boas and Ruth Benedict and continuing through Clifford Geertz, Mary Douglas, and Victor Turner. On the other hand, the new semiotic approach also incorporated materialist traditions within anthropology and other social sciences. Even some of the leading Marxist scholars in anthropology began to incorporate this new kind of symbolic and semiotic analysis, as can be seen in the work, for example, of Jean and John Comaroff. The resulting rapprochement between symbolic and materialist analyses allows today's anthropologists to study power relationships and religious iconography, global economic dynamics and the semiotics of advertising, the reinvention of local tradition and new national political forms, the ideas and practices of nongovernmental organizations, and numerous other topics, now brought together in an integrated research framework.

Semiotic Anthropology at the Turn of the Millennium

The twin concepts of indexicality and pragmatics have played an important role in the novel integrated semiotic approach that continues to develop in the early decades of the new millennium. As noted, indexical meaning is the meaning that signs derive from their immediate spatiotemporal contexts. Thus, a pointing index finger means very little if we don't know anything about the context to which it points. Similarly, there are parts of speech that are more heavily indexical than others. Words like *this* or *that*, and *now* or *before* (known as *deictics*) rely heavily on the particular places and times in which they are spoken (and thus on pragmatic meaning). However, even with these kinds of heavily context-dependent words, there is always a residual semantic meaning that is not as reliant on a particular context of use. Take, for example, *now* versus *before*. To understand exactly what is meant by any particular use of those words, we would want to know about the context in which they were spoken. But apart from some context-specific information, we already know that when people say *now* to index a temporal moment, they are generally talking about the then current time, whereas when people say *before*, they are talking about a time previous to another referenced moment. This little nugget of residual "semantic" meaning, which derives from a more abstract and conventional source in language, informs our interpretation of the meaning of those words in particular contexts.

Here, we see the beginning of a very specific model of how social context and abstract symbolic or semantic meanings can interact to make communication—and community—possible. Scholars such as Elinor Ochs and Bambi Schieffelin have employed these models in tracking how children are socialized into their communities through language practices. In political and legal anthropology, scholars like Susan Gal, Susan Hirsch, and Justin Richland have demonstrated the vital role of semiotics in struggles over national identity, citizenship, and justice. Psychological anthropologists like John Lucy and Anna Wierzbicka have tracked the interaction of semiotics with psychological orientations. It is no exaggeration to state that almost every conceivable aspect of human social and cultural life can be analyzed using this new synthetic semiotic approach. On the one hand, the turn to semiotics has introduced somewhat more precision into such broadly conceived studies. On the other hand, as the noted linguistic anthropologist Alessandro Duranti has remarked, there is a risk that this broadening has diluted the technical rigor of classical linguistic anthropological analysis. Thus, although the new synthetic semiotic model has advanced anthropological understandings in important ways, it is not without its controversial aspects as well. If semiotic anthropology continues to draw more of the broadly trained sociocultural anthropologists into using linguistic analysis, the field will likely have to take a more careful account of the potential pitfalls lurking beneath rising popularity.

On the positive side, semiotic studies in anthropology have found increasingly creative ways to trace the linkages between microlevel details of local interactions and macrolevel developments reaching national and international arenas. Concepts like "footing" and "entextualization," studies of the interaction of performance and audience, research on voicing in its social context, and other similar analytic tools have advanced our understanding of how layers of communication help connect and constitute local and global orders.

One particularly fruitful avenue of research has focused on metalinguistics and linguistic ideology as key points at which linguistic and social structures and contexts meet. "Metalinguistic" analysis examines how language is used to reflect on itself (and this can happen at a conscious level, as when we speak explicitly about how language works, or at an unconscious level, as when linguistic categories operate to regiment our understanding of how language works without any conscious reflection on the process). This line of inquiry has examined the complex modes of linguistic calibration required for speakers to actually comprehend one another, tracing the minute-to-minute processes by which metalinguistic processes connect language and social contexts. At the same time, this kind of approach has also been useful for analyses of wider institutional and political processes as they work in and through language.

Specifically, semiotic anthropologists have developed the study of metalinguistic processes at new levels, largely through an extended consideration of how "metapragmatic" function and structure operate. If the pragmatic aspect of meaning depends on contexts of speaking, then speakers operate at a metapragmatic level when they use language to index (or point to) that context-dependent meaning. So, for example, if I were to say, "I'm not trying to be argumentative; I just want some clarification," I would be using language at a meta level to talk about (and try to affect) the pragmatic meaning of my utterance. I would be highlighting the way the very words I was speaking depend on context and audience. Note that exactly the same words can mean different things depending on what metapragmatic label is given them. If members of my audience hear my words as "argument" (a linguistic label for a context-dependent type of speech), they are likely to take in what I am saying differently than if they hear them as a "request for clarification" (also a metapragmatic label). Words like *request* and *argument* are heavily metapragmatic. When speakers overtly index their own speech in this way, they are employing *explicit* metapragmatics, often in an effort to name or control the context-dependent meaning of an utterance. (This conception of explicitness is not the same as J. L. Austin's category of "explicit performatives," although there is some overlap.)

Metapragmatic structuring ranges from explicit to implicit levels and is often not consciously reflected on by speakers. At a broad institutional level, metapragmatic levels of language take the form of *linguistic ideologies*, which have been described by semiotic anthropologists as clusters of metalinguistic ideas about the social functioning of language in context. Linguistic ideologies are generally socially shared among speakers in structured ways that reflect wider power relationships, stages of national or cultural or other struggle, and so on. For example, the idea that speaking a particular language is evidence of ethnic or national identity is a linguistic ideology. Close analysis of these kinds of ideologies can permit anthropologists to achieve more integrated studies of the intersection of local language use and entrenched social hierarchies (or ongoing social struggles over culture and identity). Linguistic ethnographies in institutions like schools can capture this intersection with vivid precision.

As semiotic anthropology moves further into this fascinating nexus of micro- and macrolevel processes, it stands poised to shed new light on important social and cultural problems, from the role of courts in social change, through struggles over gendered and racial identities, to the constitution of citizenship and safety in an ever more connected global arena.

Service, Elman R.

Elman Rogers Service (1915–1996) was a central figure in the 20th-century exploration of cultural evolution directed toward explaining cultural phenomena in causal terms.

Life and Career

Service was born in Tecumseh, Michigan, in 1915, not far from the University of Michigan, and as a teenager during the Great Depression, he directly witnessed the inequalities that provoked so many of his later intellectual interests and gave him a lifelong commitment to social justice. Service's high school was closed for lack of funds in 1933 before the end of his senior year, and he had to delay starting his undergraduate studies at the University of Michigan until he could save enough money from a job in a Southern California aircraft factory. But Service fought his way back, both as a factory worker and as an amateur Golden Gloves boxer.

Before starting his studies for a bachelor's degree at the University of Michigan, Service volunteered to fight against fascism during the Spanish Civil War. He served in the Abraham Lincoln Brigade and was wounded and hospitalized. He rarely spoke of his service in the war, but he offered an anecdote about being fortunate enough to be hospitalized with John Murra (himself later to be an important figure in anthropology), where they amused themselves by learning colorful Spanish epithets. Although Service was very much a serious force in the world, he characteristically took care not to take himself too seriously or allow others to do so.

Returning to the University of Michigan in 1938, Service earned a degree in English, with some coursework in anthropology, in 1941. He then proceeded to a year of graduate study in anthropology at the University of Chicago in 1942, before World War II drew him to military service in France with the U.S. army.

After the war, Service resumed his graduate career at Columbia University. The small faculty of Columbia's Department of Anthropology took on 150 graduate students in the early postwar years until 1953. Many were there on the G.I. Bill, and military service and the strain of readjustment to civilian life promoted bonding among men eager to regain their place in academic careers. That camaraderie heightened some of the divisions within the Department of Anthropology, where a fracture line split it into two camps, one committed to a humanities approach to anthropology, following Ruth Benedict, and the other to materialist approaches to anthropology, following Julian Steward.

Service was a leader among the students aligned with Steward and materialism, including Pedro Carrasco, Stanley Diamond, Clifford Evans, Louis Faron, Morton Fried, Anthony Leeds, Robert Manners, Betty Meggers, Sidney Mintz, Robert F. Murphy, John Murra, Elena Padilla, Vera Rubin, Elliott Skinner, and Eric Wolf. Many joined together in a study and discussion group that met often to discuss different topics built around papers or talks by volunteers from the group. This group came to call itself, largely at Service's impetus, the "Mundial Upheaval Society," or MUS.

Eric Wolf later commented that Service was respected to the extent of being seen as "something of a hero." He came from small-town America; he had fought as a Golden Gloves boxer; he had fought in Spain; and he had even taken anthropology

courses with Leslie White, who was then a major contender against Robert Lowie in the fight over evolution in cultural anthropology that was waged in the pages of the *American Anthropologist* and the *Southwestern Journal of Anthropology*. He had ventured to the floor of the Grand Canyon to do fieldwork among the Havasupai. He understood and had original thoughts on the study of kinship, and he offered an evolutionary discussion of social organization. And, in common with most in the MUS, Service aspired to understand and explain culture in terms of *causality*.

Following a year of fieldwork in Paraguay, Service completed his PhD in 1950 and began his own teaching career at Columbia. He shared an office with Morton Fried, with whom he also shared a lifelong interest in the evolution of political systems, though they came to quite divergent positions on the origins of ancient states. Fried took a tough-minded approach based in conflict theory and saw states emerging and expanding through exploitation. Service took an integrationist approach, arguing that increasing political centralization must offer at least *some* benefits from ruling elites.

In 1953, Service returned to teach at the University of Michigan, initiating what was later occasionally characterized as the "Michigan-Columbia Axis." Over the next 16 years, even with White's presence at Michigan, Service became the preeminent scholar in cultural evolution. In 1969, Service moved to the University of California, Santa Barbara, where he continued an active scholarly life until his death in 1996.

Professional Contributions

With a strong background in evolutionary thought and in pursuit of causal accounts of cultural phenomena, Service used comparative ethnography to explore transitions from small-scale egalitarian societies to centrally organized states and empires. To facilitate comparability, Service organized ethnographic cases under the evolutionary categories of band, tribe, chiefdom, and state. Although he made many contributions to the study of social organization, cultural evolution, political organization, Latin American ethnohistory and ethnography, and history of anthropology, Service became most widely known for his classification system.

Cultural anthropologists appropriately argue over the fit of cases to these categories, but the point was not to make cases fit. These were *ideal types*, so that failures to fit are not failures of the method but opportunities to explore *why* the fit doesn't work. For example, the category "tribe" proved to be the most problematic, and this resulted in productive reconsiderations. And the category of "chiefdom" was especially provocative for research on transitions to centrally controlled societies that has been particularly influential and productively contentious in archaeology.

Though Service's contributions are particularly influential in archaeology, they are often not fully explored in cultural anthropology. Perhaps this is in part because his band, tribe, chiefdom, and state system of organization became *foundational knowledge* that organizes every introductory anthropology textbook. But the value of the system is in challenging us toward greater clarity in noting variations as well as commonalities. Service's aim was not to offer merely another typology of stages. What distinguished his evolutionary approach was that he wanted to explore how evolutionary change works. The clarity in his contributions toward understanding such challenging questions contrasted with the abundance of fads and jargon that often infect anthropology. With characteristic good humor he responded with a clever critique under the title "Models for the Methodology of Mouthtalk."

Although recognized as a major figure in the 20th century in anthropology, Service consistently avoided any demonstrations of self-importance. He did not place himself in the spotlight at professional conferences, though he once quipped that he did agree to go to occasions when he was being "institutionalized."

Simmel, Georg

Georg Simmel was born in Berlin into a Jewish merchant family in 1858. He died in Strasbourg, soon after being elected as professor of philosophy there, in 1918, toward the end of World War I. His relative economic independence allowed him to pursue a distinctive intellectual career even while the anti-Semitism of his day worked to marginalize him in the German academy. A contemporary of, and an intellectual sparring partner with, Ferdinand Tönnies, Émile Durkheim, and Max Weber, Simmel is considered one of the preeminent sociologists of the early 20th century. He is best known for his essays on diverse social and cultural forms, for example, "The Adventure," "The Stranger," "The Sociology of the Senses," and "Some Remarks on Prostitution in the Present and the Future," among many others. However, throughout his career, in parallel with his sociological writing, Simmel lectured on the Enlightenment philosophy of Immanuel Kant, aligning himself with eminent neo-Kantians of the late 19th century, including Wilhelm Dilthey. And, for the most part, he described himself as a philosopher. He did not envisage sociology rivaling and setting itself on a par with the natural sciences. Instead, he developed his social philosophy, true to Kantian principles of critique, as a reflection on the limits of human social and cultural experience.

After the First World War, social scientists increasingly looked to the natural sciences for models of disciplinary progress. Simmel's work, with its antimechanistic essayistic qualities, acquired an opaque status—influential but rarely integral. While postmodern trends from the 1980s onward favored a return to Simmelian styles of inquiry, the even more fluid situation in 21st-century social inquiry may encourage a further reassessment of Simmel's contribution, particularly regarding his work on money and on webs of interaction.

Simmel and Neo-Kantian Social Philosophy

German social thought at the end of the 19th century was in search of a philosophical basis for the study of modern society of the kind that Kant had established for natural science. In addition to his critical work on scientific reason, Kant had proposed an anthropology that would investigate what humans make of themselves as free-acting social beings. Taking his lead from Kant, Simmel aimed in his essays to explain and to mirror the freedom, open-endedness, and contradictions of social life as humanly experienced. His later work, notably on Rembrandt, explicitly argues against social determinism, attending instead to the rich individuality of social (especially aesthetic) life. In this light, Simmel can be understood as one of the most authentic late-19th-century interpreters of the philosophical anthropology initiated by Kant.

For Simmel, the heterogeneous quality of modern society and culture responded to universal forms of subjective development. His earliest work explored how the tendency toward differentiation is primary in human thought and social interaction. Humans distinguish; they search out and create differences within the continuum of their experience. As a result, history tells of a constant elaboration of cultural differences. Of all the distinctions generated by human experience, Simmel proposes that the primary, and perhaps most inescapable, is that between what he calls subjective culture and objective culture. Subjective culture describes the imaginative world of the self in its full activity and potential. Objective culture is experienced as that which exists outside the self, acting autonomously with regard to the self. Objective culture constrains what selves can

or should know about the world around them, but it also presents the individual with aims and objects of desire. Against Durkheim, who had envisaged society as a totality that mapped its differences onto individuals, Simmel argued that differences begin in the fluid creativity of the individual mind. Through interaction, subjectively generated distinctions are formalized and gain objectivity within a continuously changing social milieu.

The idea of subjective culture may seem less self-evident from the perspective of latter-day social science than are Simmel's ideas concerning objective culture: Yet the distinction between these two is crucial to his thought. Simmel notes a situation where subjectively valued worldviews can remain inchoate because they do not acquire an objective form. He saw the female-centered cultures of his day in this light: Subjectively vibrant worlds were muted by a dominantly male objective culture. However, no objective cultural form could ultimately constrain the movement of subjective thought, Simmel proposes. Subjectivity and objectivity have distinct qualities; subjective culture is characterized by variation, openness, and flux, whereas the forms of objective culture are valued for their stability, closure, and relative invariance. It is in the nature of subjectivity as a life force that it tries to break the rules or boundaries that objectivity presents, and yet objectivity is valued for the regulative standard that it provides.

A Philosopher of Modernity

Simmel is above all a philosopher of modernity. At one level, for him, modernity describes a dissatisfaction with unchanging precepts and a welcoming of new venues for the realization of subjectivity through differentiation. Again, Simmel saw modern experience as contradictory: It potentialized a fuller and freer development of human personality, but simultaneously it generated new compulsions and duties. Modernity and the metropolitan life were notable for a blasé detachment from things and people close at hand and a desire for the distant and the ephemeral. On the other hand, modern forms of association seemed to welcome individual-centered forms of self-expression as well as notions of personal responsibility that transcended group loyalties. In a series of interconnected works, Simmel suggested that the experiences of the city, of fashion, and of the ubiquitous use of money—all characteristic markers of modernity—are effectively synonymous in terms of their causes and effects. Each of these phenomena arose out of, and in different ways provided venues for, the subjective search for freedom vis-à-vis objective conditions. Simmel argued, however, that individuals themselves initiated new kinds of objectivity through their search for freedoms; and they experienced whatever was objective as a constraint and an obligation. The involvement of an individual in new aesthetic or intellectual fashions, for example, could be felt as a freedom from previously closed social circles. However, entry into these unfamiliar milieus would crystallize new dependencies for that same individual within an enlarged web of relationships and a further differentiated cultural array.

For Simmel, the term *modern* catches the experience of expanded and variegated networks of interaction, highly diversified forms of objective culture, and, hence, the engagement of the individual in multiplex relationships and affiliations. Modernity is, then, both a purely relative term and the objective historical correlate of a universal tendency in subjective development. Simmel was not a social evolutionist: He did not envisage a necessary progress in objective institutions. Notwithstanding his views on the universal significance of individuality in all social processes, his interpretation of objective culture was relativistic. Each sphere of objective culture established its own rules and patterns. It did not follow, for example, from the success of laboratory science that the value of all other forms of culture could be measured (or even eliminated) according to a scientific perspective. An art appreciation that found the cause of the artwork in the chemistry of brushstrokes, the psychology of vision, or the surrounding social conditions would be diminished and insufficient. Cultural forms flourished to the extent that they captured and extended the vitality of subjective experience. Objective culture lost its significance when it no longer provided an object for subjective energy and imagination.

In his anthropological writings, Kant had referred to what he called the "unsociable sociability" of the human being. He proposed that together hostility and hospitality were driving forces in human social development. For Simmel too, conflict was not simply a by-product of human interaction, it was an inevitable element in the generation of valuable social relationships and cultural forms. Every

new relationship entered into by an individual was marked by new kinds of conflict. For example, when two people married, their family groupings were effectively conjoined, resulting in conflicts and negotiations with in-laws. The formation of new relationships brought with it problems of allegiance to forms of objective culture for the individuals concerned. One shape conflict could take was in the urge toward the social closure provided by secrecy versus countervailing interests in openness, unveiling, and transparency. Given his fascination with the two-sidedness of social experience, it is not surprising that, for Simmel, social conflict was congruent with new kinds of freedom of action. At the same time, he indexed sociability as an escape from the weight of everyday social activity. In their daily interactions, individuals tended to be valued for their distinct objective capacities. Contrastingly, in the realm of sociability, there was a chance of expressing some of the full vivacity of an individual's subjective lifeworld in an artful way. Through the imaginative play of sociability, conflicts between objective and subjective culture could be explored without engendering real-life consequences.

Influence on Later Anthropology and Social Theory

Simmel's influence on later anthropology and social theory is in certain ways indirect and clouded. Simmel himself recognized that his distinct style of social philosophy, however influential, was unlikely to create a specific school or following. He had set his own thought against certain trends that were gaining ascendance by the end of the 19th century. These included Durkheim's social determinism but also, in particular, Friedrich Nietszche's philosophy of the will. Nietszche had drawn on evolutionist ideas to attack the humanist universalism of the neo-Kantians. In his study of Nietzsche and Arthur Schopenhauer, Simmel welcomed the influence of both these philosophers. However, for him the commitment to a philosophical path was necessarily a personal one, and he adhered to Kant's view of human individuals as social beings who sought aesthetic, moral, and rational freedoms through their relations with others.

The adoption of Simmel's ideas in anthropology has taken different shapes at different times. During the discipline's formative years, few social or cultural anthropologists felt the need to cite Simmel, though his influence was present in the emergence of key themes. From the 1940s onward, anthropologists became increasingly aware of the role of conflict in shaping social structure. Simmel's essays "The Sociology of Conflict" and the "Web of Group Affiliation" presaged recognition of how fission and fusion complement each other in the establishment of social relationships. Debates around this theme came to be integral to the social anthropological work of the mid-20th century. In this regard, both the titles and the arguments of Meyer Fortes's "The Web of Kinship Among the Tallensi" and of Max Gluckman's lectures on "Custom and Conflict in Africa" indicate strong conceptual links to Simmel, though neither anthropologist acknowledges the social philosopher explicitly.

More recently, in particular, it has been Simmel's work on money and his insights into social networks that has drawn attention. Recognition of the implications of the Internet as a social form brought a new engagement with Simmel's formal sociology of networks and webs of association. We should exercise caution here, though, recognizing that Simmel was never purely interested in the formal-objective aspect of the social—that for him, what he termed subjective culture was at least equally significant and inextricable from the meaning of objective forms. This last observation is, in turn, relevant to understanding the renewed significance of Simmel's philosophy of money. Money could be—and, he argued, was—used to analyze social reality quantitatively and thereby to break down accustomed cultural distinctions. From this point of view, money assisted in freeing individuals from their habitual dependence on people and things close at hand. However, where it began to be treated in purely formal or analytic terms, as something independent from individual life interests, the danger arose of money becoming the vehicle of a generalized moral-aesthetic indifference.

Simmel emphasized the heterogeneity of cultural forms as objects of interaction and subjective investment. Culture as an objective array did not of itself fall into any overarching system. Behind the specific validity coherence and the coherence of cultural phenomena lay the vivacity of subjective interests and imaginings; apart from these, the cultural form presented merely an empty possibility. Again, it is this anti-systematism that has posed the most difficulty when attempts are made to incorporate Simmel into

social science as a discipline. As such, Simmel's open-ended essays continue to provoke countless different kinds of reflection on the field of human interaction and culture, without providing any defined method or operational model.

Smith, Adam

Adam Smith (1723–1790) is most famous for being the father of modern economics. His masterpiece, *An Inquiry Into the Nature and Causes of the Wealth of Nations*, is the first systematic account of the political and social organization of a free market economy. But Smith was a political economist second and a philosopher first, investigating human nature and its relationship to society and governance in all of his writing. Political economy, for Smith, was a branch of moral philosophy, and his work is foundational to numerous other disciplines, including anthropology, sociology, and English.

Smith published two books in his lifetime. The first, *The Theory of Moral Sentiments* (TMS), published in 1759, asked what virtue is and how it is acquired. The second, *An Inquiry Into the Nature and Causes of the Wealth of Nations* (WN), published in 1776, asked what it meant for a nation to be wealthy and how this wealth was to be increased. These two parallel sets of questions reveal his overall project: the search for principles that govern human social interaction and deliberation. TMS starts with an investigation of those forces that motivate individuals, and WN ends with a description of the proper method of financing the sovereign. His writing thus conceived describes the continuity of experience within a society of discrete persons.

Background

Smith was born in 1723 in Kirkaldy, Scotland, to a widowed mother; he never married and had no children. He was educated in a local public school, then Glasgow College, and finally Oxford University, becoming an independent lecturer in Edinburgh after graduating. While some of his earliest writing had its origins during his time in Oxford and Edinburgh, TMS was written while he was a faculty member at Glasgow University. Student notes on his class lectures on justice and on rhetoric and belles lettres survive.

Smith left Glasgow to be a private traveling tutor, during which time he immersed himself in political economy, considering numerous schools of thought, particularly those put forth by the French physiocrats and philosophes. He then returned to Kirkaldy, where he spent years finishing WN. He remained there, working as a customs officer, until he died.

Smith's biography does not reveal his attention to detail or his obsessive focus on the minutiae of his work. Both of his books were revised repeatedly during his lifetime, and while scholars debate what they have in common, there is little doubt that Smith sought to create a philosophical system describing human nature, community organization, and the social and political institutions that resulted. His work moves back and forth between descriptive claims about the evolution of society and prescriptive assertions about the best way to live and govern. Smith was working before the fragmentation of the humanistic disciplines. He would have had no concept of anthropology, sociology, psychology, or history as distinct and discrete fields of study. Instead, by doing moral philosophy writ large, Smith was able to use historical records, sociological data, observation, and moral and psychological insight together to articulate the human experience. By writing on political economy, Smith was doing more than just economics. He was working with philosophy, political science, economics, anthropology, psychology, sociology, history, literature, and archaeology.

In these endeavors, Smith was a typical member of the Scottish Enlightenment. While some refer to the Enlightenment as a monolithic entity, Europe is best described as having three separate but overlapping conversations. There were German, French, and Scottish enlightenments, each of which asked similar questions but had their own emphases. For Smith and his countrymen, the Enlightenment was a way of articulating a unique and independent Scottish voice, while emphasizing the complementary nature of human reason and emotions. They were also concerned with the power of history, the ability of science (or natural philosophy, as Smith would understand it) to describe human behavior, and the nature of collective deliberation. In this respect, Smith's work can be considered anthropological because he articulates the nature of "progress" from primitive to commercial society. He concluded that different economic institutions necessitated different kinds of government and as economic behavior grew more sophisticated, government naturally changed with it.

Predictability and Human Nature

Smith and the other Scottish Enlightenment thinkers were also deeply influenced by Isaac Newton, applying Newton's method to moral philosophy and, by extension, sociological analysis. Newton famously argued that the laws that govern the heavens were the same as those that governed the earth. He reduced physical behavior to a handful of laws, insisting that they are universal and work together. Analogously, Smith argued that the principles that govern individual activity were few in number and contiguous with those that governed the collectivity; individual behavior for Smith is not radically distinct from group behavior and can be explained by referencing the same processes.

However, while Newton believed that the laws of nature allowed for predictive certainty about objects, Smith argued that the principles of human behavior were in tension with one another. As a result, detailed predictions were impossible. Thus, while it is true that philosophers could identify historical patterns (for Smith, nations progress through four stages of history: hunters, shepherds, farmers, and merchants) and while it is also true that human psychology can be reduced to the two fundamental motivations of self-interest and benevolence, more precise prediction is beyond science. We cannot know what a person will do with any certainty, nor can we effectively socially engineer it. Instead, the complexity of human behavior, combined with the vicissitudes of historical development, make it appear as if social progress is guided by an invisible hand, an unseen force that directs the forward movement of history itself, furthering human knowledge and economic specialization and identifying and realizing aspects of justice along the way.

Scholars debate the meaning of the invisible hand. Some suggest that it is merely a turn of phrase with uncommon rhetorical power. Others argue that it describes different phenomena in each of Smith's different uses. Still others insist that it is Smith's acknowledgment that God has designed nature to act a certain way, in accordance with a premeditated plan for human development. (Smith was likely a deist who believed in a creator but not an interventionist God.) Whatever the meaning, it is most certainly a metaphor for the ways in which economic activity tends toward a just distribution of resources.

In TMS (1976), Smith uses the idea of the invisible hand to show that free market exchange results in "nearly the same distribution of the necessaries of life, which would have been made, had the earth been divided into equal portions among all its inhabitants" (pp. 184–185). In WN, Smith cites the invisible hand to show that self-interest, taken collectively, promotes economic advancement in ways no individual agent intends. In his early essay on the history of astronomy, he uses the phrase to describe primitive attitudes about divine intervention. The invisible hand thus prefigures the social science emphasis on "unintended consequences," outcomes disconnected from human motivation, and the libertarian faith in "spontaneous order," the belief that left alone, social and political chaos inevitably gives way to order.

It is unlikely that Smith would be comfortable being associated with modern-day libertarianism, but it is evident that his phrase has a vibrant life of its own. In contemporary parlance, the invisible hand is most commonly used as shorthand to describe the economic and social progress that comes from free market commercial interaction, suggesting falsely that Smith did not believe the government had a strong role to play in society and the economy. In actuality, he was in favor of taxation, public education, government support of the arts, and economic policies that

helped raise the standard of living of the poor and the working class. Ultimately, his point in WN is that a nation's wealth comes not from the amount of money within its borders at any one time—this is the position held by mercantilists, whom he opposed—but by the value of labor in a society. Increased labor means increased wealth, and free trade allows for increased labor. Thus, the more a nation trades, the wealthier it is. The invisible hand ensures that individual wealth acquisition benefits everyone in society.

Political Theory and Moral Psychology

It is noteworthy that the invisible hand appears throughout his works. It underscores that the phrase has moral as well as economic content, emphasizing Smith's belief that free markets are moral solutions to the problems of oppression and poverty. Smith hoped to develop a philosophical system that promoted "universal opulence," the circumstance in which all members of society had access to the necessities of life (as opposed to conveniences and luxuries, which are not equally distributed). He also argued that all people in society should have the liberty to choose their own profession, pursue their own goals, and follow their own religious beliefs.

Smith rejected the idea of a social contract, dismissing the notion that human beings could ever live outside society. The state of nature, for Smith, is not a useful comparative to political life, even if it is postulated as a hypothetical benchmark for liberty. One can only compare different stages of human development to measure progress. The final stage, the "system of natural liberty," Smith believed, was both the most stable and the most affluent way of organizing a modern society. Smith is frequently considered a proponent of classical liberalism and mentioned alongside John Locke, John Stuart Mill, and similar political theorists.

Smith also struggled with the philosophical foundations of moral justification. For example, David Hume, Smith's friend and longtime interlocutor, famously wrote that "*reason is, and ought* [italics added] only to be the *slave of the passions* [italics added]." In return, Smith argued that individuals were guided by a natural sympathy, a technical term Smith defines as "fellow-feeling with any passion whatever" but that more modern readers would call empathy. Smith's theory of sympathy has been interpreted as moral agreement, a process of emotive modulation, and a description of how people seek moral approval of others. No scholarly consensus exists on its precise meaning, but for Smith, human sympathy is proof that people are not solely self-interested. The first line of TMS—its Newtonian starting principle—argues that individuals take an interest in other people's fortunes, even if the person derives nothing but the pleasure of watching others' happiness. This nod toward altruism, a term coined many years after Smith's death, is sometimes seen as contradicting the self-interested economic motivations emphasized in WN. Most commonly referred to as "The Adam Smith Problem," this claim of inconsistency is a mistaken and ideological interpretation of Smith's work. As indicated above, individuals are motivated by both self-interest and a concern for others, sometimes simultaneously, and the tension between the two helps moderate the more extreme passions. All of Smith's work references both self-interested and benevolent motivations.

Passions are most effectively kept in check, for Smith, when a community rewards or punishes a moral actor; TMS is largely a moral psychology of acculturation and sometimes appears to be a defense of cultural relativism. But Smith balances his demand for social surveillance by highlighting the human capacity to imagine an impartial spectator, an intersubjective guide, for those times when no one is watching or when a moral actor feels strongly enough to disagree with the dominant social norms. The impartial spectator is, in essence, a theory of conscience, and Smith never suggests that it is any more real than other products of the human imagination. Smith, like Hume and others, was intrigued by the imagination and emphasized its limitations. For Smith, because it is a creation of the agent's mind, the impartiality of the spectator is imperfect, and justice often advances only in the long run, as history unfolds and as the shortcomings of all individuals and all communities give way to the natural laws of progress. Smith was an empiricist; he struggled with Hume's claim that one could not logically derive an "ought" from an "is" and thus relied on the laws of nature to guide human beings in their moral, political, and economic endeavors. History and progress, he argued, reveal the "ought" over time, and the invisible hand moves societies toward a more just framework.

Smith, Grafton Elliot

Grafton Elliot Smith (1871–1937) was an Australian British anatomist and physical anthropologist, prominent both as an early student of human brain evolution and as a late advocate of a reductive, naive theory of human cultural history.

Life and Career

Educated in medical anatomy first in Sydney and then subsequently at Cambridge, Smith moved to Cairo and taught anatomy from 1899 to 1908, where he studied ancient mummies and became infatuated with the idea of the Egyptians as the source of ancient civilization. He subsequently returned to England to be dean of the Faculty of Medicine at Manchester University, and ultimately, in 1918, he became professor of anatomy at the University of London. Among the students he taught were (undergraduate) Ashley Montagu (a British American anthropologist and humanist) and (medical) Solly Zuckerman (a British public servant, zoologist, and operational research pioneer) and Raymond Dart (an Australian anatomist and anthropologist). Smith received many honors for his neuroanatomical research, and was knighted in 1934.

In anthropology, however, he is remembered mostly for the things he was wrong about. Smith passed expert judgment on the Piltdown Man remains and contributed to their authentication. He felt that the remains (later to be known as the most infamous case of scientific fraud in history) validated his theory that the brain was the first aspect of human anatomy to reach its modern form. More notoriously, he founded a small and iconoclastic "hyper-diffusionist" school of anthropology, along with the ethnologist William J. Perry at University College London and the Austrian linguist Father Wilhelm Schmidt.

The Heliolithic School

To the German-English idea that different people developed similar ideas independently of one another because of the common properties of the human mind, Smith developed an alternative—namely that different people have similar ideas because they received them from a common source. Paradoxically, although Smith was primarily known as an evolutionary biologist, it was his antagonists in anthropology who were known as the "evolutionists"; Smith's model was "diffusionism." In large part, the synchronic "functionalism" of Bronisław Malinowski and A. R. Radcliffe-Brown attempted to transcend the historical interpretive issues that had divided the two earlier British schools, evolutionism and diffusionism.

Early German anthropologists such as Friedrich Ratzel and Fritz Graebner had adopted the view that some form of historical contact resulted in the pattern of broad similarities seen among the world's cultures. Smith's version of diffusionism, however, was about the origin of civilization itself. According to this "heliolithic" theory, rather than seeing diverse peoples as equally creative, only the ("Hamitic") ancient Egyptians were considered fundamentally creative and were thus the source of all early cultural knowledge, from mummification in Oceania to pyramids in Mesoamerica.

Smith's theory was also founded on the wrong side of a classic paradigm shift in early anthropology, involving the concept of "culture." To the anthropological generation of the late 19th century, the term was used synonymously with "civilization," as an attainment in varying degrees by different peoples. In the early 20th century, as used by Franz Boas in the United States and Malinowski in England, the term came to refer to the particular lifeways of diverse peoples, which they all possessed entirely and equally, although differently. Smith's theory of the diffusion of "culture" is actually about the diffusion of "civilization"; he used *culture* in a sense that was already obsolete, and he reified *civilization* just as it was being parsed and problematized by a newer generation of anthropologists, such as Alexander Goldenweiser and Alfred Kroeber.

In reifying civilization and trying to identify how different peoples came to acquire it, Smith (1915) was able to identify (spuriously) any and all cultural achievements as evidence of an Egyptian inheritance. Since civilization was so complex, it stood to reason that different peoples would not have assembled it independently by chance means (an argument similar to that of the "irreducible complexity" of life, popular among creationists many decades later), and thus, he categorically rejected the ideas "put forth ex cathedra by the majority of modern anthropologists" (p. vi).

In *The Diffusion of Culture* (1933), Smith continued to bring his focus on the brain to the subject that other anthropological scholars were trying to understand as social process. He denied the "psychic unity of mankind" (which made individual qualities largely irrelevant in historical explanations) and imagined the innovative genius to be the limiting factor in culture change. Thus, seeing pyramids in Mexico and Egypt, he would not identify a fundamental structural constraint on the separate attempts to create a large, stable edifice but would imagine rather a primordial phantom architect and his descendant copyists, imitators, and victims. Smith's model of human history was drawn not from the nascent history of science and technology, where simultaneous independent innovation is the rule (hence the famous obsession of scientists with establishing priority), but from the more familiar bellicose and colonial practices of his own civilization. As he explained it in a leading scientific journal in 1917,

> When a small band of immigrants, intent upon exploiting the mineral wealth, forces its way into a barbarous country, and, in virtue of its superiority of weapons or of skill and knowledge, is able to dominate the local people, and compel it to work for them, the stamp of the alien civilization, its practises, its customs and beliefs, can be imprinted upon a large servile population. (p. 246)

Smith thus universalized the colonial British experience to the entire history of the human species. His theory of culture enjoyed transient popularity, owing largely to Smith's reputation in anatomy, and brought his anthropological ideas (which otherwise would have been ignored as anti-intellectual fluff) a measure of scholarly gravity. He wrote the entry "Anthropology" for the 12th (1922) edition of the *Encyclopedia Britannica*, but it was quickly superseded.

Smith, Neil

Neil R. Smith (1954–2012) was an urban geographer and dialectical materialist. Deeply influenced by Karl Marx, David Harvey, and Henri Lefebvre, Smith developed insight into the historical geography of capitalism through attention to the spatial contradictions inherent in capitalist growth, particularly at the urban and global scales. His theories of uneven development, gentrification, the production of nature, and the politics of scale have been a widely influential part of a recent *spatial turn* in the social sciences. Smith was known for advocating and practicing an unrepentant yet open materialism, receptive to insights from postmodernism, feminism, and critical race theory without dispensing with a commitment to materialist analysis of class within an anticapitalist framework. Throughout his career, Smith worked tirelessly against the eclipsing of politics in theory, imagination, and representation, whether in his appointed disciplines of geography and anthropology or in the world at large. His attention remained focused, especially in the last years of his life, on the necessity and possibility of revolution against capitalism.

Biography and Major Works

Born in 1954 in Leith, Scotland, Smith earned his BA at the University of St. Andrews before enrolling at Johns Hopkins University. He studied the relationship between capitalism and the production of space as a graduate student under David Harvey, focusing on the phenomenon of gentrification. In 1979, Smith introduced two of his most influential contributions: (1) his theory of the "rent gap" and (2) his distinct approach to "uneven development." Influenced heavily by Lefebvre's theory of the production of space, Smith argued that the logic of capitalism is at the root of the geographic unevenness of development. Smith quickly became known for his prolific and invigorating writing. Soon after completing his PhD in 1982, he adapted his dissertation into the book *Uneven Development* (1984), which may still be his best known work. Smith taught at Columbia University, Rutgers University, and the University of Aberdeen before accepting a position as Distinguished Professor of Anthropology at the Graduate Center of the City University of New York in 2000. During these years, Smith became well-known as a mentor to a generation of radical geographers, through teaching as well as with the establishment of institutions such as City University of New York's Center for Place, Culture and Politics. Moreover, Smith developed a reputation as a scholar whose political commitments and intellectual pursuits took him far beyond the academy, cultivating insights and experiences that reflected and guided his academic work.

Contributions to Anthropology

Smith's contributions to the subfields of urban, political, and economic anthropology as well as to wider disciplines are far ranging. However, they can be located along the conceptual axes aligning his most important areas of work: gentrification, uneven development, scale, and the production of nature.

Smith's concept of the "rent gap" is widely used among anthropologists and geographers (e.g., Setha Low, Eliza Darling, Julian Brash, and Judith Whitehead) and remains one of the most influential causal explanations of the economic and speculative logics behind gentrification and urban displacement. Disinvestment of capital in the built environment, Smith argued, not only causes decline and abandonment of urban centers but also paradoxically creates an increasing gap between actual and potential ground rent extraction. This catalyzes a moment of speculation during which properties may be purchased cheaply and then utilized to extract higher rents (from wealthier tenants). Rapid reinvestment kicks off a new cycle of neighborhood-wide development, leading to the displacement of previous neighborhood residents. Documenting a wide range of examples in cities across the world, Smith was sharply attuned to the ways in which gentrification had become what he called "a global urban strategy."

Smith's work on *uneven development* has widely influenced anthropologists and geographers (e.g., Ida Susser, Ruth Wilson Gilmore, and Vinay Gidwani). His approach to uneven development is highly indebted to classic texts of V. I. Lenin, Rosa Luxemburg, and Leon Trotsky; at the same time, he provides new theoretical insights for understanding the contemporary geographic dynamics of capitalist development. Uneven development is a structural feature of capitalist accumulation that affects a highly polarized landscape of overdevelopment and underdevelopment through the reorganization of the built environment. According to Smith, uneven development should also be understood in relation to what he called the *production of nature*—that is, that nature itself is a socially and politically produced category often posited as an "outside" to capitalist society. Smith's theories of nature, along with those of contemporaries in geography and anthropology (e.g., Cindi Katz, Noel Castree, and Donna Haraway), have been fundamental for contemporary approaches to theorizing the dialectical relation of nature to society. They have influenced theoretical discourse on contemporary productive and reproductive technologies. Smith has also argued influentially that nature itself has become "an accumulation strategy" entirely unique to capitalism.

In *Uneven Development* and subsequent works, Smith articulates a *theory of scale* based on Peter Taylor's Urban–Nation (State)–Global schema. This theory views scales as emerging from the fundamental spatial tension between differentiation and equalization in capitalist development. Smith later refined this framework to incorporate feminism and social movement theory, recognizing scales as arising from reproduction and consumption as well as production processes. He posited a "politics of scale" in which scale is socially constructed through contestation, and he emphasized smaller scales—the body, the household, and the community. He coined the phrase "jumping scale" to signify efforts to transcend the scalar limits of social struggle. Smith's theories of scale have been particularly influential for urban theorists and commentators on neoliberalism (e.g., Anna Tsing, Neil Brenner, Nik Theodore, and Don Mitchell).

Throughout his work, Smith demonstrated a passionate preoccupation with war and imperialism, influenced as much by his political commitments as by his intellectual fascination with the forces of capitalist expansion, spatial integration, and the concentration of economic and political command. These works are alike in their attempt to think about Empire through a geographic framework and to read the intellectual legacy of war as entwined in the formation of geography as a discipline.

Legacy

Smith's conceptual contributions bridge fields of radical urban spatial theory, geography, and anthropology to produce social theory in the service of understanding capitalism, with a strong emphasis on class and a persistently revolutionary perspective. Smith also succeeded as an internationalist both in his politics and in his intellectual ambitions, with much time and energy spent traveling for intellectual and political contributions to spaces inside and outside academia. His work has been well received internationally and has been translated into several languages.

Smith, William Robertson

William Robertson Smith (1846–1894) was a celebrated Scottish biblical critic, theorist of religion, and theorist of myth. His accomplishments were multiple. First, he brought higher biblical criticism from Germany to the English-speaking world. He then developed it far beyond its Germanic origins. Where his mentors reconstructed the history of

Israelite religion from the Bible itself, he ventured outside the Bible to Semitic religion and thereby pioneered the comparative study of religion. Others viewed religion from the standpoint of the individual. He approached ancient religion from the standpoint of the group and thereby helped pioneer the sociology of religion.

As an original theorist of religion, Smith asserted that ancient religion was centrally a matter not of creed but of ritual. Practice counted much more than belief. Religion was initially communion between god and humans, not a prescientific explanation of the world. As an equally original theorist of myth, Smith similarly maintained that myth was initially not an explanation of the world but instead an explanation of ritual. He thereby pioneered the myth and ritual theory.

Smith was strikingly precocious. In 1870, at the age of 23, he was named professor of Old Testament at the College of the Free Church in Aberdeen. He began teaching a day after his ordination as a minister in the Free Church.

On the basis of his entry "Bible" for the ninth edition (1875) of the *Encyclopaedia Britannica*, Smith was, in 1876, formally charged with heresy by his church. Smith, following the older, Continental scholars with whom he had become acquainted, deemed the Book of Deuteronomy not Moses' farewell address to Israel but instead a work composed long after Moses' time. Smith's Free Church critics assumed that in denying Mosaic authorship of Deuteronomy, he was denying the divine authority of the Bible. On the contrary, argued Smith, revelation itself was gradual, so that the denial of Mosaic authorship was simply the denial that the advanced, prophetic views expressed in Deuteronomy had been revealed to Moses himself. After 4 years, during which Smith was suspended from his chair, he won his case and was reinstated. But the appearance of subsequent articles reopened the charge, and though never convicted of heresy, he was, in 1881, removed from his professorship.

Embittered but undeterred, Smith had already begun to offer public lectures on his views to huge audiences in Edinburgh and Glasgow. From these lectures came his first two books, *The Old Testament in the Jewish Church* (1881) and *The Prophets of Israel and Their Place in History to the Close of the Eighth Century* (1882/2002).

To support himself, Smith became coeditor and eventually sole editor of the same edition of the *Encyclopaedia Britannica* that had caused his undoing. In 1883, he moved to Cambridge University, and in 1889, he became Sir Thomas Adams Professor of Arabic. He utilized his knowledge of Arabic to root Israelite religion in ancient Arabia, where for him lay the origin of Semitic culture as a whole. His studies culminated in his final and fullest work, *Lectures on the Religion of the Semites*, which were delivered as three series of Burnett Lectures at the University of Aberdeen from 1888 to 1891.

In the *Lectures*, Smith turns to "heathen Arabia" as the earliest and therefore presumably clearest case of Semitic religion. He asserts that the Semites were initially at a "primitive" stage of culture. He even uses "primitive" and "ancient" almost interchangeably. Yet unlike his protégé J. G. Frazer, who was interested in only the similarities among "primitives" the world over, Smith was equally interested in the differences—between early Semites and other "primitives," between early and later Semites, and between Jews and Christians. Still, his focus on the early similarities was revolutionary and controversial.

Smith's focus on practice rather than belief as the core of primitive religion was equally revolutionary. Yet on ritual, as on other aspects of religion, his revolution abruptly stops short. He does not propose that modern religion likewise be taken as ritualistic. He draws a rigid hiatus between primitive and modern religion. He approaches modern religion no differently from others of his day. It is creedal first and ritualistic second—a reflection of Smith's antiritualistic, anti-Catholic viewpoint. Where 20th-century theorists of religion stress the similarities between primitive and modern religion, Smith stresses the differences.

Smith was revolutionary most of all in seeing ancient and primitive religion as collective rather than individual. Because he takes for granted that modern religion is a matter of the individual, his revolutionary approach once again abruptly stops short. He does not, like Émile Durkheim, argue that religion per se is collective.

Durkheim, one of the pioneering sociologists of religion, is indebted to Smith for the focus on ritual as well as belief, on the group rather than the individual, and most exactly on totemism as the first form of religion. But he offers a far fuller sociology of religion than Smith. Not only does Durkheim "sociologize" all religion, but also his sociologizing of even primitive religion goes deeper than Smith's.

For Smith, as for Durkheim, the function of primitive religion is the preservation of the group. But Smith does not, like Durkheim, make group experience the origin of even primitive, let alone modern, religion, and he most certainly does not, like Durkheim, make the group the object of worship in even primitive, let alone modern, religion.

Equally indebted to Smith is Sigmund Freud, who, like Durkheim, credits Smith above all with deeming totemism the earliest stage of religion. (Strictly, Smith appropriated, not created, the idea of totemism.) Freud focuses on the totemic meal but turns Smith's notion of a loving activity into the killing of the totem, which is to say the killing of God. And unlike Durkheim as well as Smith, Freud maintains that the equivalent of the totemic deed is the heart of every stage of religion thereafter.

Smith's legacy is hardly limited to totemism; however, totemism, Smith's most explicit area of influence on Durkheim and Freud, has long since been rejected as the beginning of religion.

Smithsonian Institution

Since its founding in 1846 by an act of the U.S. Congress, the Smithsonian Institution has played a central role in the development and institutionalization of American anthropology. It is recognized for initiating in-depth fieldwork practices, establishing early linguistic research, as well as being a collecting institution that provides a public platform for the dissemination of anthropological research.

Origins of Smithsonian Anthropology

The origins of anthropology in the United States can be traced back to a series of collecting surveys and excursions, the first being the United States Exploring Expedition of 1838–1842 (Wilkes Expedition), which gathered natural history and ethnographic material from South America, the Pacific, and the Northwest Coast of the United States. Following lengthy debates as to the kind of institution that should be established from the bequest of James Smithson (1765–1829), a research center—the Smithsonian Institution—was established in 1846 by the U.S. Congress, with the respected physicist Joseph Henry (1797–1878) as the first secretary. Henry's primary endeavor was a publication series titled *Contributions to Knowledge*. The first volume, *Ancient Monuments of the Mississippi Valley: Comprising the Results of Extensive Original Surveys and Explorations* (1848), by Ephraim George Squier and Edwin Hamilton Davis, documented the ancient earthworks of Ohio and Kentucky, classifying sites according to function, such as burial grounds and fortifications. From the start, collecting was an essential research strategy for the Smithsonian. The Board of Regents launched a nationwide network made up of government officers, missionaries, and independent researchers for the widespread collection of specimens, calling on secretaries of state, the treasury, and military divisions for assistance.

Influences on Smithsonian anthropology can also be traced back to the linguistic surveys of North American tribes pursued by the then secretary of state, Thomas Jefferson (1743–1826), and Henry Rowe Schoolcraft (1793–1864). At the inaugural meeting of

the Board of Regents of the Smithsonian Institution, Schoolcraft submitted a "Plan for the Investigation of American Ethnology," which advocated for the development of a library of philology. Schoolcraft argued that language (grammar, vocabularies, etc.) was an enduring and thus critical source to understand Native Americans. He was successful in establishing philology as a keystone to Smithsonian research, thereby instituting linguistics as one of the central endeavors within American anthropology.

During these early years, ethnology—as social cultural anthropology was then termed—followed an established set of natural history methods for the classification of specimens. Early field collectors and ethnologists, such as Edward Palmer (1831–1911), John Wesley Powell (1834–1902), Robert Kennicott (1835–1866), Walter Jesse Fewkes (1850–1930), and James Stevenson (d. 1888), had their initial training in natural history (botany, geology, and zoology). The first assistant secretary of the Smithsonian Institution, Spencer Fullerton Baird (1823–1887), not only applied the biological systematics of Linnaeus in his development of the overall institutional collecting schemas, he also provided specific instructions and equipment to military officers and explorers educating them how to collect. Baird also set about organizing and exhibiting this vast inventory from the newly chartered territories of North America, laying the foundations for the U.S. National Museum.

Bureau of American Ethnology (1879–1965)

The founding of the Bureau of Ethnology in 1879, later known as the Bureau of American Ethnology (BAE), ushered in the first institution devoted to the methodological study of Native Americans. Government funded, the work of the BAE was linked to the wider Smithsonian through shared expeditions and the resulting collections. The bureau's broad interests in the past and present ways of life of the North American tribes led to an extensive system of researchers and publications, such as the *Annual Reports* and the *Handbook of North American Indians.* Powell, the bureau's founder, began his scientific career as director of the U.S. Geographical and Geological Survey of the Rocky Mountains, leading expeditions to the Western territories, including the famous expedition down the Colorado and Grand Canyon in 1869. Powell documented the languages of the tribes he encountered, positioning him as one of the leading figures in early U.S. field research. According to Powell, research at the BAE should include eight subjects: (1) somatology (skeletons, especially the skull), (2) philology (classification of language stocks and mapping original habitats), (3) mythology, (4) sociology (following Lewis Henry Morgan's kinship structures), (5) habits and customs (mortuary and religious ceremonies), (6) technology, (7) archaeology, and (8) the history of Indian affairs (including treaties, cession of lands, removals, and schooling). Powell's synthetic approach to anthropology was also heavily influenced by his preoccupation with survey work and the systematic collection of data.

After founding the bureau, Powell lost no time in launching expeditions—the first of which departed for the Southwest region in 1879. This was led by Stevenson and commenced at the Pueblo of Zuni, followed by Hopi and some of the Rio Grande Pueblos. The expedition comprised the photographer John K. Hillers (1843–1925); Stevenson's wife, Matilda Coxe Stevenson (1849–1915); and the newly hired ethnologist at the U.S. National Museum, Frank Hamilton Cushing (1857–1900). Under Powell's direction, this expedition resulted in one of the first systematic ethnographic and photographic studies, leading to the high visibility of American anthropology in the late 19th century. Photographs and ethnographic specimens were distributed to historical societies and libraries around the nation and world as part of the Smithsonian's vision for the dissemination of knowledge and cultivation of public interests in Native North American cultures.

The 1879 expedition also resulted in the first example of participant observation fieldwork in Americanist anthropology. When the research party moved on to Hopi, Cushing remained in Zuni, where he set about learning the language, studying the philosophy and history of the Zunis over a period of 5 years. Departing from Powell's commitment to Morgan's evolutionary hierarchy, Cushing paid more attention to the relationship between people and their physical environment over time. As he advocated an in-depth understanding of Zuni culture and emphasized the mental structures that shaped people's perception of the world, Cushing's work is now regarded as a precursor to French structuralism. Cushing is also remembered for his initiation into the Bow Priest society in Zuni, which not only gave him access to Zuni esoteric ritual

knowledge but also assigned him responsibilities toward the protection of the Zuni people. In his day, however, Cushing was criticized by a number of his colleagues for his immersive and intuitive approach to fieldwork, revealing early tensions in the discipline between the empiricist and subjectivist positions.

Through its early in-depth research projects, the BAE and Smithsonian forged a new kind of field ethnology. In particular, long-term research commitments to specific regions and tribes gave the bureau a defining role in the study of the people of North America. The bureau was also the first institution that could fund professional anthropologists, giving key figures in American anthropology their start in anthropology, including James Mooney (1861–1921), who conducted extensive fieldwork, principally among the Cherokee and Kiowa. His field experiences acquainted him with methods used by tribes to transmit their history through formulas, ceremony, and art, resulting in his privileging ethnohistorical approaches. Matilda Coxe Stevenson dedicated more than 30 years to the Puebloan cultures of the Southwest, pioneering the earliest use of a photographic series. Fewkes devoted years to archaeological and ethnographic fieldwork at Hopi villages and is recognized as the first ethnographer in 1890 to make sound recordings of traditional songs. Consequently, the professionalization of fieldwork, the adaptation of new technologies, and the widely distributed publications positioned the bureau as the most prominent producer of ethnographic data in the United States in the late 19th and early 20th centuries.

By the 1890s, Powell argued that he and his colleagues had moved anthropology beyond survey and armchair analysis and that "by long training, by great zeal, and by deep scientific insight, these gentlemen are now able to accomplish results far beyond the elementary stage, and the significance of the data being rapidly gathered becomes more apparent" (BAE Annual Report, 1894). Appropriate organizing schemas, however, were not wholly apparent, resulting in debates over differing theoretical lines—as shown by the different approaches adopted by the BAE, the U.S. National Museum, and later by Franz Boas at the American Museum of Natural History in New York.

Anthropology at the U.S. National Museum

Initially, the Smithsonian's anthropological collections were housed in the U.S. Patent Office, but by 1881, as the result of vigorous collecting, they had outgrown this space, and Congress approved the building of the U.S. National Museum. The Division of Anthropology was established in 1883 and, while emphasizing North America, the museum's collecting and research program became worldwide in scope.

The first curator of ethnology at the U.S. National Museum, Otis T. Mason (1838–1908), played a key role in designing Smithsonian classification schemas. Baird had chosen Mason to oversee the organization of the North American collections and encouraged him to draw on the taxonomies of natural history for their identification. Mason was also heavily influenced by Gustav Klemm (1802–1867) of the Museum of Ethnology in Leipzig, whose system of classification was built on the unity of global cultures as defined by environmental factors. Ascribing to this culture history approach in anthropology, Mason was fascinated by the evolution of human invention. Under Mason's direction, anthropologists at the National Museum studied how things were made as a way to get at the creators' minds. Alongside William Henry Holmes (1846–1933) and Cushing, Mason used this research to develop exhibits, creating life groups organized according to culture areas, demonstrating specific knowledge, such as stone tool making and Puebloan weaving. These life groups formed the core exhibits at numerous world expositions and the U.S. National Museum, as well as becoming the technique used by Boas in his creation of dioramas at the American Museum of Natural History in New York. In the journal *Science* in 1887, however, Boas criticized Mason for basing his analysis on external form, suggesting that appearances were often misleading and that it was important to interpret the ethnological specimens according to their specific history and meaning. Despite this refutation of Mason's view of anthropology, Boas and the Boasian lineage owed some of their beginnings to the collective work of the BAE, the National Museum, and innovators such as Cushing and Mooney. Due to its inability to confer academic degrees, however, the Smithsonian's legacy has often been ignored.

Diversity of Anthropology at the Smithsonian

Following World War II, while the Smithsonian anthropology remained primarily focused on the Americas, a more global outlook continued to

develop with research in Africa, Asia, and the Pacific. In 1965, this endeavor took new directions with the hiring of Chicago-trained Sol Tax (1907–1995), who became an advisor to the Smithsonian's secretary, Sidney Dillon Ripley II (1913–2001). Three years later, the Center for the Study of Man was established, with Tax as its first director. With its broad mission of applying anthropological knowledge to problems faced by the world, the center helped transform anthropology at the Smithsonian, establishing various programs of ongoing importance. The challenges posed by merging individual researchers into new collectives and by changes in the funding base eventually led to the center's termination in 1983. As part of these developments, the BAE was dissolved in 1965, and its staff joined the National Museum of Natural History, Department of Anthropology. In 1968, the BAE's archives became the foundation for the National Anthropological Archives, which has become the single most important repository for anthropological materials in the United States. The National Anthropological Film Center had been founded in 1975 as part of the center, assembling more than half a million feet of anthropological research film. In 1981, the National Anthropological Film Center joined the National Anthropological Archives and became the Human Studies Film Archives. Under the editorship of former BAE member and curator for North America Ethnology, William C. Sturtevant (1926–2009), in 1978 the Smithsonian began publishing the edited scholarly reference volumes *The Handbook of North American Indians*. While much of the center was absorbed into the National Museum of Natural History, Department of Anthropology, other anthropological research developed outside the center, principally through the annual Folklife Festival. Beginning in 1967, and now a part of the larger workings of the Center for Folklife and Cultural Heritage, the festival remains an important showcase and forum for the global diversity of the performing arts and their intangible heritage.

In the 1980s, Ivan Karp (curator for African Ethnology) and Steven D. Lavine examined the role of anthropology in museums through the prominent interdisciplinary conference and subsequent edited volume *Exhibiting Cultures: The Poetics and Politics of Museum Display* (1991), which explored museums as arenas that provided key insights into social interactions. The Arctic Studies Center formed by William Fitzhugh (curator of Archaeology) in 1988, exemplified this method of interdisciplinary and collaborative research with indigenous communities, including an exhibit that relocated more than 500 objects to the Anchorage Museum in Alaska. Following a decade-long negotiation with the Pueblo of Zuni over the definition of cultural patrimony, in 1987, the Smithsonian returned the *Ahayu:da*, or War Gods, to the Pueblo of Zuni. *Ahayu:da* are twin gods carved by the Bear and Deer clans to serve as protective guardians for the Zuni people. After their annual tenure, new *Ahayu:da* are created, and previous ones are purposely placed on shrines, where their disintegration process is vital in replenishing the earth with their powers. In 1991, in accordance with legislation passed by Congress, the Repatriation Office was established in the Department of Anthropology to facilitate the return of human remains, sacred objects, and objects of cultural patrimony to Native American tribes. Collaborative work with communities has also been forged by the National Museum of the American Indian, which was established by an act of Congress in 1989 to house the former collections of the Museum of the American Indian, New York. With a new museum opening on the mall in 2004, the National Museum of the American Indian displays exhibits co-curated by museum staff and indigenous communities from across the Americas. In 2009, this collaborative approach to collections at the Smithsonian was expanded through the *Recovering Voices* initiative, which connects communities across the globe with their respective collections and archival materials to help foster grassroots heritage efforts in the maintenance of endangered languages and knowledge.

With more than 160 years of history, the Smithsonian Institution—particularly the BAE—is recognized as being integral to the founding of American anthropology. Its specific contributions comprise laying the groundwork for a discipline based in fieldwork—including participant observation methods—institutionalizing the study of linguistics of indigenous peoples, and professionalizing the discipline through the support of long-term research. An important legacy of Smithsonian anthropology are the collections, which have become a building block for indigenous communities for the

development of heritage programs, thereby adding diverse dimensions to anthropology's future.

Social Constructionism

Social constructionism is a type of philosophical idealism; its opposite is realism. That means the intellectual (*geistig*) being is the reason of the material being—and not vice versa. Social constructionists believe that the world cannot be accurately represented by language (*abbildtheorie*), but rather, language creates a socially agreed-on construction of the world. This means that the world cannot be seen as essence, as realism sees it. Social constructionism is relevant especially in psychological anthropology and to questions of identity, ethnicity, and race.

Social Constructionism in Current Anthropology

Reference books on social and cultural anthropology seldom mention social constructionism. Rather, the term (*social*) *constructionism* is used in many different contexts that presuppose a very broad definition, such as representation, race, identity, postcolonial theory, and Foucauldian discourse analysis. Scholars associated with the term include Stuart Hall, Talal Asad, Edward Said, Richard A. Shweder, Clifford Geertz, and James Clifford. That the term *social construction* is used in such different ways is not totally wrong, but it does hinder the use of the term as a scientific theory or a scientific position; rather, in this broad sense, it means *any* production of knowledge. For instance, Said's study *Orientalism* is a Foucauldian-inspired discourse analysis rather than social constructionism; it does not need concrete actors, but social constructionism essentially does. On the other hand, the adjacent social sciences—especially sociology and psychology—do have a profiled definition of social constructionism. If anthropology were to share this fairly precise definition of social constructionism, interdisciplinary communication would be improved. What remains then to be understood by social constructionism?

Philosophical Background

In the social sciences, the term *constructionism* mostly refers to the sociological work of Peter L. Berger and Thomas Luckmann. The epistemological idea of constructionism is of course much older and refers back to the early 18th century—to the work of Giambattista Vico. Vico rejected the idea that people should be studied using scientific methods, and he therefore opposed the mathematically and scientifically oriented philosophy of René Descartes. He argued that a Cartesian approach ignored the human self as *producer* of cultural meaning and symbol systems. Thus, constructionism is about the ways in which human beings create their own realities.

Social constructionist thinking does not assume per se that the world cannot be explained according to the principles of natural science. Even radical constructionists do argue in that sense: Truth about the "objective" world cannot be found in that

methodology. In Vico's writings, this corresponds to the separation of nature and history. He designs his constructionism as analogous to God's action only for history, and thus only for human space of creative action. This means that we are not able to uncover reality; rather, we construct our perceived reality (*wirklichkeit*); that is, what is true (*verum*) and what is objectively real (*factum*) do not coincide in human action and insight. Human beings can only gain truth by constructing it through thoughts, language, and history. The limitedness of human understanding is therefore the origin of interpretation in the humanities and social sciences. The world of this productiveness is the world of probability. Reason *and* fantasy, logic *and* action, nothing can be separated. The world—as a human world—is always an interpreted and constructed world. As Geertz wrote in a 1984 essay, "We see the lives of others through lenses of our own grinding and . . . they look back on ours through ones of their own" (p. 275).

Influences on Social Constructionism

Beside the aforementioned sociological developments, social constructionism experienced a renaissance in the 1980s, but the sources from which it draws its inspirations are quite varied. Only one common focus can be found: the linguistic turn inspired by Ludwig Wittgenstein's later linguistic theory, published as *Philosophical Investigations*. For Wittgenstein, words do not get their meaning because of their relation to reality or to objects; they receive meaning only in the context of their use in speaking. The much quoted Wittgensteinian *meaning-as-use* takes place in a social context and in social practices: in "language games." Next to this common reference, other influences on current social constructionist approaches can be identified as follows:

Thomas Kuhn's *The Structure of Scientific Revolutions* (1962), which allowed thinking about different scientific realities, showed that scientific knowledge production is subject to the support of a community. Karin Knorr-Cetina showed that this is true not only for knowledge of philosophical subjects but for knowledge of scientific subjects as well.

The two methodical approaches of *ethnomethodology* and *conversation analysis* have impressively shown in everyday situations and conversations how such common constructions occur in reality: Daily activities are subject to many conventions and follow rules over which individuals exercise only very limited influence.

The *radical constructionism* of Ernst von Glasersfeld, Humberto Maturana, and Francisco Varela has also contributed. Radical constructionism emphasizes the ways in which the individual mind constructs reality, whereas social constructionism emphasizes the ways in which societies construct reality; but both share basic assumptions regarding the problem of representation (the question whether meaning resides in the real world of objects or not), the reference to reality, the limitations of human epistemic abilities (*erkenntnisfähigkeit*), and the availability of world (*weltverfügung*).

Premises of Social Constructionism

- All human knowledge is historically and culturally variable and is the product of social communities.
- Knowledge construction is tied to specific languages and language areas. That means knowledge formulated in a specific language cannot be generalized and cannot be claimed to be true over time. That means also that the claim of scientific neutrality and objectivity must be rejected.
- The world cannot be represented by language (*abbildtheorie*), but language creates the world within social speaking, so that the world can never be considered as essence. Meanings do not adhere to words or things; rather, they are (re) negotiated in social interactions depending on the specific context. Cultural traditions guarantee the "certainty" of understanding. Thus, social constructionism is identified as a variation of philosophical idealism, which means the intellectual (*geistig*) being is the reason of the material being—and not vice versa.
- Human insight (*rkennen*) takes place as a productive process and is not reducible to the deduction of insights from the material facts or structures. Accordingly, human thinking and acting transcend the acquisition (*widerspiegelung*) of material and social conditions; they are not essentially instrumental-rational.

- A fundamental insight of constructionism is the *limitation of human action and cognition*. Or, following Vico, if we take it seriously that the human being is a perceiving subject, then truth and reality will become identifiable through their appearance in his or her thoughts, speech, and history. But situation, perspective, and horizon remain limited in principle. Insight itself is ascertainable neither by observation or contemplation nor by summing up separated perspectives or merging of different horizons. This leads to relativism in regard to truth and the validity of knowledge and leads to criteria of truth such as instrumental usefulness.
- If the world is constructed in social interactions, then this applies to all existing things in it, including individual ideas and feelings. Emotions do not arise in the head or belly of the individual; they are negotiated in social practices in which individuals (have to) take part. That means the individual adopts them.
- If things remain changeable, and are permanently negotiated, there is always the opportunity to influence and manipulate them. In this respect, social constructionist theories claim to have an emancipatory character.

Methods

Methodological consequences result from these premises: The methods and ideas borrowed from natural science can be neglected in favor of hermeneutic and linguistic analyses. Hermeneutic methods include ethnomethodology, autoethnography, conversation analysis, and some varieties of discourse analysis.

Conversation analysis and specific forms of discourse analysis, such as the approaches of Derek Edwards and Jonathan Potter, are sometimes criticized as linguistic rather than social science methods. They confuse speaking (social interaction) with language (grammatical analysis) and thus miss the proper subject.

Critique

- Similar to the confusion between language and speaking, some variants of social constructionism explicitly reject an acting subject and the resulting subjectivity—and thus the agent, its intentionality, and its agency (*handlungsfähigkeit*). Mostly, the acting subject is just seen as a passive partaker in these practices; at best, it appears as "subject position" or, more neutral, as "positioning." In this understanding, because texts gain meaning purely from their relationship with other texts, they do not require knowledge, experience, or other psychological constructs. Texts do not need authors if they only refer to other texts. However, Wittgenstein's *meaning-as-use* requires genuine speaking subjects who *participate* in the language game. We learn the meaning of concepts through actually playing the language game (Saussurean *parole*). Meaning without an interpretive subject would be meaningless as well as senseless. Language itself does not require speakers; it is an abstract system about the relation of the signified and the signifier (Saussurean *langue*).
- By ignoring the role of the individual, some forms of social constructionism also deny a role to the physical body, treating it as a passive canvas for social attributes. Experience (*erfahrung*), bodily experience (*erleben*), and body language are only considered if these produce readable signs. This excludes the fact that the body acts out of physically anchored experience and can be subversive in its expressivity and desire.
- Following constructivism radically would lead to a world of *anything goes*; that is, no one could be made responsible for suffering. Suffering would be individualized as construction, and the causation would be disputable. Therefore, the idea of realism remains necessary. It keeps open the option that there is an objective world outside language. Only with the realism apriority—in the sense of Immanuel Kant—can we refer to the responsibility of human beings and reason conditions that cannot be questioned by discourse—for example, human dignity.

Social Studies of Science

Social studies of science is a multidisciplinary approach to analyzing scientific and technological practice. The field is also referred to as science, technology, and society or science and technology studies. (As the differences between approaches are slight, the abbreviation STS will serve here.) The flagship journal for the field is *Social Studies of Science*, first appearing in 1971. In 1976, the Society for the Social Study of Science held its first annual meeting and released the first issue of its journal, *Science, Technology, and Human Values.* STS is an international concern, represented by professional societies that include the European Association of Science and Technology, the Japanese Society for Science and Technology Studies, and the Latin American Society for the Social Study of Science and Technology. There are a growing number of STS programs at both undergraduate and graduate levels, either run independently or in conjunction with history, sociology, anthropology, and policy programs.

The next section of this entry presents the early and mid-20th-century foundation on which STS was built. Four themes are then detailed that represent major areas of study: (1) laboratories and fields, (2) networks, (3) hybrids and bodies, and (4) controversies. Although not covered here, it is important to note that STS has been engaged with postcolonial, racial, and queer theory as well as scholarship on visualization in science, public understanding of science, and human-animal relations, and the study of social sciences, including economics.

Foundations

Science and technology became ever more central to social, economic, and political life in the 20th century. Scholars saw a need to understand these changing dynamics. Philosophy, history, and sociology had already begun to study science as a system of knowledge. Several European intellectual communities, most notably the logical positivists of the 1920s Vienna circle, debated whether and how scientific thinking was unique. Karl Popper's *Logic of Scientific Discovery* (1935) argued that a scientific fact must be "falsifiable," ideally through experiment. In the same year, the Polish doctor Ludwik Fleck published *The Genesis and Development of a Scientific Fact.* Like Popper, Fleck was concerned about the epistemological character of scientific facts. Using biological and medical case studies, he refuted the positivists' conception of facts as objective, free-floating entities. Instead, facts emerged from the cultural worlds of the people who assert them, or "thought collectives."

In the United States, historians and sociologists were also turning their attention to the study of science. Thomas Kuhn drew from perspectives in history and philosophy of science to write *The Structure of Scientific Revolutions*, published in 1962. In representing scientific practice as radical shifts in "paradigms," as opposed to the stepwise accumulation of data that putatively describes "nature" with greater and greater precision, Kuhn offered an antipositivist account.

At Columbia University, Robert K. Merton did pioneering work in the sociology of science, beginning with his 1938 doctoral dissertation "Science, Technology and Society in 17th Century England." He directed attention away from the foundations of scientific knowledge toward the institutional features of modern science. In 1942, he codified his program around the "norms" of science to characterize an

ethos of science whose coexistence and interdependencies lead to the production of a scientific workforce and its consequent knowledge.

Scholars in the Science Studies unit, an interdisciplinary center established in Edinburgh in 1964 by David Edge, criticized such normative approaches. The critique evolved into what David Bloor called the Strong Program of the Sociology of Scientific Knowledge (SSK). SSK applied a constructivist and relativist approach to analyzing the content of science. In *Knowledge and Social Imagery*, Bloor drew on Émile Durkheim's *Elementary Forms of Religious Life* to build an analogy between religion and science that would suggest why one might undertake a social study of science as part of the promise of social science to demystify the making of all human knowledge.

By the end of the 1970s, scholars were engaged in a cross-disciplinary dialogue that coalesced under the umbrella of STS.

Laboratories and Fields

One focus of STS has been to study science as it is practiced. As STS expanded from the sociological focus of SSK, early laboratory studies explicitly drew on anthropological theory and methods, including ethnomethodological practices. The first of these, published in 1979, was Bruno Latour's and Steve Woolgar's *Laboratory Life: The Social Construction of Scientific Facts*. Latour commented on the surprising fact that no "anthropological excursions" had been made to study the "tribes of scientists." Situating scientists as tribes with attending cultures opened the door for questions of kinship and life cycles in science. In 1988, Sharon Traweek modeled her analysis of the Stanford Linear Accelerator in *Beamtimes and Lifetimes* on E. E. Evans-Pritchard's study of the Nuer. Just as making sense of the Nuer required the anthropologist to understand how the Nuer made sense of cattle, Traweek argued that understanding physicists meant understanding how they made sense of detectors.

Additionally, Karin Knorr-Cetina, Michael Lynch, and others argued that facts, as Fleck had earlier observed, were not lying around waiting to be discovered but were actively created through social and material processes. These accounts examined how politics and cultures were ever present in the lab. In studying how facts become stable and accepted, analysts focused on the artifacts necessary for their production and circulation. They argued that no step in lab work is self-evident; each requires a social decision. Accordingly, since lab work is social, the facts that are produced from lab work are as much social as natural.

Scientific work occurs in the field as well as in the laboratory. Charles Goodwin, Cori Hayden, Stefan Helmreich, and Christopher Henke have all used ethnography—from anthropological, linguistic, and sociological starting points—to follow knowledge and techniques as they move into the field and the wider public culture. Studying how science happens in different places raises the question of the epistemological importance of place in scientific practice. Robert Kohler, in his 2002 *Landscapes and Labscapes*, historicized the "lab-field" border and the way practices moved across this border. A laboratory strives to be placeless. Far from being a mirror of nature, lab work strips a phenomenon of certain attributes so as to focus on those that scientists deem important. Facts are authoritative because they emerge from a carefully controlled lab setting. Aware of the intimate connection between authority and the laboratory, scientific field-workers often emulate lab procedures in the field to lend a similar legitimacy to their work.

Networks

Following science beyond the laboratory required a reconceptualization of the relationship between science and society. Dissatisfied with an assumed distinction between these two spheres, Bruno Latour, Michel Callon, and John Law developed actor-network theory (ANT) in the 1980s. ANT used the imagery of a network to place STS on the same plane, arguing that they were simultaneously constructed. This symmetry also applied to the actors: Human and nonhuman actors potentially share equal agency within the network. ANT required a new definition of "social" in which any tie between two actors is social, even if not part of what commonly would be called the social sphere. In a famous example, Callon framed scallops, fishermen, and scientists as actors, each with fluid identities and relationships, while writing about controversial fishing practices. With the social destabilized, the goal of an ANT analyst is, as Latour coined, to "reassemble the social."

Though technologies are lively actors within ANT, the social construction of technology focuses explicitly on technological systems. This field is more influenced by SSK and the history of technology and deviates from ANT in that social and technical domains remain distinct and stable. However, social construction of technology, like ANT, embraces a networked worldview.

Wiebe Biker, Thomas Hughes, and Trevor Pinch's book, *The Social Construction of Technological Systems* (1987), shifts technology studies from how technology influences society to how social forces influence technological development. Emblematic of this work is Donald MacKenzie's *Inventing Accuracy*, which addresses how nuclear missile guidance both shapes and is shaped by its social context. MacKenzie illustrates a network populated by technicians, politicians, and the military, arguing that it is this web of interactions, not a natural technological trajectory, that explains the historical increase in the accuracy of ballistic missiles.

Hybrids and Bodies

While network approaches detail how humans are enrolled in complex techno-scientific systems, another stream of STS focuses on how the human body is itself already a hybrid of science and technology. David Mindell's work examines humans as they live in machines (warships, spacecrafts) and the simultaneous embrace and rejection of being part of a mechanical system. Sherry Turkle's study of an early Internet program sorts through the psychological impact of the newly emerging networked self.

Donna Haraway, drawing from both STS and feminist scholarship, presents the cyborg to argue that we are all human-technological hybrids. This requires a rethinking and possible rejection of the nature/culture binary. Haraway thus suggests the erasure of other binaries, specifically those stemming from gender, race, and class.

Marilyn Strathern, in *Partial Connections*, found traction with the image of the cyborg when considering the analytic difficulty in switching scales that necessarily accompany anthropology's move to cross-cultural comparison. Haraway's cyborg captures the positioning of the ethnographer as simultaneously embedded and looking beyond a situation, and thus caught between being one person and something more than one person. Strathern's work flows back into STS through works such as Annemarie Mol's *Body Multiple* (2002). In detailing the experience of patients with atherosclerosis, Mol innovatively presents two narratives simultaneously. The ethnographic and analytic texts both appear on the same page but without explicit connections. Her book visually reflects Strathern's characterization of being more than one but less than many.

Haraway, joined by Evelyn Fox Keller, Emily Martin, Rayna Rapp, and Sarah Franklin, brought feminist theory into STS. As the body is a fruitful place to explore questions of sex and gender, STS feminist studies focused on the biological sciences, signifying a shift away from the physical sciences that early theorists found exemplary when thinking through facts and experiments.

Controversies

An early approach to controversy studies played with Kuhn's theory of shifting paradigms, when the "normal" science of work within a paradigm shifted to "revolutionary" science. The heterodox nature of revolutionary science can lead to controversy. With this model, there must be a mechanism by which a new paradigm is shored up. Harry Collins's notion of the "experimenters' regress," the inability to know whether a replicated experiment supports a truth claim or reinforces false premises, suggested that it is not simply a competently performed experiment that ends a controversy, because what is or is not "competent" is under debate. Latour noted that controversies do not end because of the emergence of indisputable facts. Rather, what in retrospect looks like indisputable facts are the result of a resolved controversy. Peter Galison argued against such clear shifts from one paradigm to another. Instead, his "trading zones," modeled on anthropological understandings of how cultures exchange goods despite speaking different languages, account for how scientists who might appear to be working in different paradigms develop a discourse that allows seemingly incommensurable theories to be simultaneously developed.

Conclusion

STS scholars have begun to ask what their role is in scientific controversies. Should STS be an activist discipline, more intimately engaged with scientists and the policy questions they raise? Sheila Jasanoff reframed the language of "controversy," suggesting instead a model of "coproduction" in which knowledge and social order are simultaneously produced. Jasanoff advocated for the scholar to offer critical reflection while still being actively engaged.

Debating whether and how STS should be socially or politically active has encouraged the examination of topics that illustrate how scientific work affects people beyond the laboratory. Kim Fortun's *Advocacy After Bhopal* situated her role as activist and offered a study of an industrial disaster and the role of advocacy networks, while Steven Epstein has

examined the role of lay and expert knowledge in the area of biomedical activism.

STS is still concerned with questions raised early on about lab work, fieldwork, and scientific facts. Though the complex network of STS defies description in any single work, STS continues to attend to micro and macro processes, following them wherever they lead.

SOCIOLINGUISTICS

As the two constituting terms *linguistics* and *society* suggest, sociolinguistics studies the relationship between language and society. An explanation of these terms will help define sociolinguistics, its subject matter and goals, and delineate its scope, its specific themes, and its research interests.

Linguistics: Formal and Social Orientation

Linguistics is the scientific study of language. Broad differentiation is often made between "theoretical or formal" and "empirical or social" approaches to the study of language. The most influential theoretical linguist in the past 60 years is Noam Chomsky. According to Chomsky, linguistics is concerned with an ideal speaker-listener, who is in a completely homogeneous speech community and knows its language perfectly. Chomsky's works in the field of syntax, which stress the analyses of deep linguistic rules that govern language as a system, exemplify this formal approach. Other theoretical linguists include Björn Lindblom, Manfred Krifka, and Bruce Hayes, who study phonetics, semantics, and phonology, respectively. Theoretical linguists study the formal properties of languages; they focus on the abstract system of knowledge possessed by the so-called idealized *speaker-hearer* of a language rather than on what a language user does with it or its functions. Their goal is to elucidate the universal nature of language by making sense of rules that users have internalized.

The empirical approach to the study of language is different from, and perhaps in reaction to, theoretical linguistics. With orientation toward actual societies, this approach, known as sociolinguistics, studies the actual utterances of speakers as they occur in varying societal situations and contexts. Instead of explicating an abstract system of knowledge possessed by a speaker, the focus is on "talk" and its contents and goals. Sociolinguistics sees language as a cultural product, a communal property that, among other things, encodes societal values, members' dispositions, and how members use language to negotiate relations. Furthermore, sociolinguistics focuses on the communicative and social functions of language, aiming to understand native meanings and texts as well as subtexts. Thus, the domain of sociolinguistics is the actual, day-to-day utterances of individuals as members of a group or society as they negotiate different social situations. It studies language use and variations in the context of a society and social situations.

Subject Matter of Sociolinguistics

Sociolinguistics focuses on communications in a society—that is, a group of interacting people. Just

as a society is vast and complex, the study of the speech of such a society is equally vast and complex. In response to this complexity, scholars have carved out diverse specializations and research questions through which they obtain meaningful insights into the often perplexing issues arising from rapid changes in social structures. Some scholars study the relationship between language and social categories such as identity, gender, ethnicity, and sexuality. Others are concerned with how language changes over time and how such changes either affect or are affected by social forces. Integral to sociolinguistics, however, is the study of language variation. One of the goals of studying variation is to understand the many internal variations observed among individuals and groups in light of the specific linguistic norms that work to curtail these variations such that participants still communicate meaningfully. Since there are many ways to speak, sociolinguistics studies the existence and use of multiple languages within a community (multilingualism). This includes an understanding of the choices that individuals make when switching between different languages in conversations (code switching). Sociolinguistics also studies the attitudes, feelings, and views of individuals and groups to the different varieties of language used in their society. Governmental policies concerning language use are also studied in sociolinguistics. Studying these different themes provides a comprehensive understanding of the interactions between facets of society and language use.

Group in Sociolinguistics

The notion of group is important to sociolinguistics. "Group" is used to describe people who are geographically bound, who fraternize for social, religious, political, cultural, familial, or vocational reasons and share similar speech norms. People live in groups, organize their existence in groups, and, in a stratified society, identify with a certain group either as minority, majority, marginalized, or dominant. Group membership may be permanent or temporary, and members use the variety of speech of their group. Different levels of groups conceptualized for research purposes by sociolinguistics include a speech community (people who use a specific language or its varieties), a community of practice (a group of people who are closely knit, who engage in similar functions and share a similar language, e.g., biologists, linguists, or tennis players), a linguistic community—which among other definitions can refer to the collective speech of a political unit (e.g., the United States), and social networks, including online and offline social relations in a society. As people move between groups or social networks, they configure their speech to conform to and reflect their group membership. The speech pattern within a group is presumed to be uniform because members adhere to the linguistic features of their group to be identified with it and be set apart from other groups. Through these conceptual levels, sociolinguistics accounts for the use of language within the community, and sociolinguists study the social motivation for the choices that people make in their use of language as they go about their daily lives. Sociolinguists also study speakers' view of their language, their attitude to the way they sound, who they consider linguistic insiders, and how they maintain language boundaries. For example, people in the United States, Nigeria, and Great Britain all say they speak English. However, there are obvious differences in the way they speak, such that most English-speaking listeners can tell which of these countries they come from. To most people in these three countries, American and British English have more prestige than Nigerian English. It is within groups that stereotypes, values, norms, desires, and attitudes of people toward self and others take their roots and find expression. The linguistic behavior of individuals, according to the sociolinguist William Labov, cannot be understood without knowledge of the community to which they belong. The society of one's primary orientation provides the context in which the linguistic codes derive their meaning and references.

Language in Society

Linguists and most nonlinguists understand language differently. Most nonlinguists think about proper and improper speech, and good and bad language. Generally, "good language" refers to a formal *standard* speech form—the variety that is taught and learned in school, found in textbooks, and perhaps used by the media. This is contrary to linguists, who make no distinction between proper and improper speech and consider standard speech as one of the many varieties in existence. To sociolinguistics in particular, the more interesting varieties are those that nonlinguists call *dialects*. They are more interesting

because they closely approximate what people actually use in their normal interactions. Nonlinguists, however, assume that *dialects* are qualitatively inferior and less correct than the standard. Linguists avoid making value judgments; they consider every form of speech used by any group of people as valid, and they consider it their task to provide accurate descriptions of the languages that they observe without prescribing rules for their use.

Members of a speech community subscribe to a certain sense of rightness or wrongness with respect to usage of their language. This presumed sense becomes the "standard linguistic version" against which actual usages are measured. In the United States, this is called Standard American English. It is referred to as Received Pronunciation in Great Britain and *Hochdeutsch* in Germany. Scholars at the linguistic end of the research spectrum might study the formal content of these varieties, while those at the social end might be interested in their relationship to social issues such as stratification, education, gender, sexuality, education, and politics. There is no homogeneous linguistic society where everyone speaks alike. For instance, there is no one way to speak English in North America. This is the result of historical and social factors ranging from the different patterns of its early settlement, to the different environments within which groups subsist, their demography, and how groups interact with each other and across social classes. The different patterns of speaking that arose due to these factors are termed *dialects* by linguistics. Linguists differentiate between language and dialect based on "mutual intelligibility." If, in spite of pronunciations or vocabularies, people from different places understand one another, then they are said to be speaking dialects of the same language; if not, then they are speaking different languages. So people in the United States are said to be speaking English even when each speaks in a dialect, be it New York, Southern, or Appalachian, among many others. There are also social dialects such as African American Vernacular English and Spanglish. While these varieties are associated with named ethnicities, they are not exclusively used by all members of these ethnicities.

Some scholars studying dialects focus on explicating their grammar, morphology, phonetics, pragmatics, or other linguistic features to illustrate the dialect's systematicity and regularity. These scholars aim at dispelling the stereotypical view that sees these dialects as incomplete languages, illogical, and crude. In the United States, the works of Lisa Green and John Rickford on African American Vernacular English are exemplary in this case. Complementarily, John Baugh studies issues relating to linguistic profiling, discrimination, and negative attitudes toward individuals who speak dialects against which there are prejudices. His works have shown that some companies screen calls on their answering machines and do not return the calls of those they believe sound "Black or Latino." From an experiment, he concluded that in the United States, most people could tell the ethnicity of another person just from hearing that person say, "Hello." Other researchers may be interested in governmental policies on languages.

Concepts in Understanding Language and Society

Terms such as *slang* (words that come into and go out of fashion), *accent* (different phonological realizations of speech sounds), and *jargon* (words specific to a profession, sport, or trade) also reveal the biases, prejudices, and stereotypes against the people and groups whose language forms are thus qualified. When a dialect is stigmatized or seen as prestigious, it is because its speakers are branded or admired. All speakers speak a dialect of their language; this is shown by their choice of words, whether they say *schlep* or *drag*, *fixing to go* or *getting ready to leave*, and *waiting on* or "waiting for" the world to change. Everyone speaks with an accent; that is, everyone's speech includes pronunciations that mark his or her regional, ethnic, or social background. For example, in American English, this may be shown by whether a speaker makes a distinction in pronouncing *pin* and *pen*, *feel* and *fill*, or whether one realizes the first vowel in *life* as a diphthong [ai] or not. We all make use of expressions that come in and out of fashion (slang), so we may be *hip*, *bad ass*, or simply *BFF*. As we move across different social and professional spheres, we adapt our language accordingly. For instance, many of the terms in this essay are linguistic jargon, just as *touchdown* is a football term and *to serve a volley* is tennis jargon.

Language Variation

It is important to find out if there is a social significance to the ways language varies within a society. Consequently, another dimension of sociolinguistics

is to identify those exact linguistic units that have social significance. Sociolinguistics seeks to determine if there are linguistic variables that are linked with social factors such as age, class, gender, and ethnicity. Labov is one of the most notable scholars in this realm, especially since his 1966 course-charting study on /r/ dropping in New York speech. He observed that whether a New Yorker pronounces the /r/ in words like *fo[r]th* or *floo[r]* correlates with his or her societal status. Following Labov, sociolinguistic studies often involve sophisticated, structured, empirical, and systematic analyses of specific usages as they vary with sociocultural factors.

Language and Gender

A major interest of sociolinguists is determining whether men and women speaking the same language use it differently. Researchers have noted phonological differences in certain languages; for example, women in general speak with a higher pitch than men. And Peter Trudgill has observed phonetic differences in Gros Ventre, a Native American language in the United States, in which men use *djatsa* and women *kjatsa* for bread. John Fischer noted that in New England more boys than girls engage in "g" dropping in words such as *running and jogging*, mostly in informal situations. Robin Lakoff suggests that in the United States, women use more tag questions (*isn't it*), color terms (*mauve*, *magenta*, *beige*), rising intonations, adjectives (*cute*, *nice*), and polite forms than men. Sociolinguistics has shown differences in style, cultures of conversation, and goals for how males and females employ language. Explanations for the observed differences include the suggestions that women engage in private talk, while men engage in public talk, and women use language to build rapport, while men engage in the communication of facts (*rapport vs. report talk*). Studies of this kind have created greater awareness of sexism in language and its relationship to the asymmetry in gender relations. In particular, scholars such as Deborah Tannen have noted lexical items that underscore male dominance in society. Most unmarked (regular) items have a masculine grammatical gender and base: *Man* is often used as a cover term for humanity, and terms like *actor* or *chairman* are considered generic. In further noting that these usages are implicated in the gender ideologies of a society, sociolinguists relate language to other social factors through which women are subordinated.

Language and Status

The style of language employed by an individual is relative to the particular person and his or her place or situation. While there are variable styles that a speaker can employ to convey an intended message, there are linguistic markers that potentially could confer prestige or stigma on the speaker, thereby indexing his or her social class. Whether one says *mmh*, *what*, or *pardon* does not change the content of the message; however, to a listener which of these is said implicates the social standing of the speaker. Class or social status gained particular salience in sociolinguistics with the work of Labov, who originally recognized that the attention given by speakers to speech was variable and depended on the goal of discourse and the degree of formality. For instance, the level of attention or care to speech correlates with the degree to which the speaker sought overt prestige. Speakers will emulate the speech pattern of those they want to resemble. Trudgill noted that men adopt "covert prestige" by using a more local dialect, whereas women use a more "standard dialect," thus displaying overt prestige.

Language and Ethnicity

Language is a very salient marker for ethnic identification. The dominant group in Western nations rarely sees itself as having ethnic affiliation; consequently, the United States, in spite of being home to many ethnicities and different (native) languages, considers itself monolingual, with English as its official language. This is, however, not the case in South Africa and Canada, with 11 and 2 official languages, respectively; neither is it the case in India, which implements a multilingual policy. To speak two languages is to be bilingual, and to speak more than two languages is to be multilingual. In most African countries, multilingualism is the norm. To Africans, the ability to use different languages is cultural and linguistic capital that enables people to freely move for labor. This is not so in the United States, especially in the South, where an increase in the use of the Spanish language is seen as threatening to the English-only view and multilingualism is viewed somewhat negatively. Sociolinguistics studies

the various attitudes of people to the existence of more than one language in their society.

Sociolinguistics studies the intersection of language and society because of the centrality of language to individual and communal goals. The field can be defined following Labov, who sees the significance of language in what it allows us to do. We can use it to exercise or resist power, gain influence, or diminish others. Whether we use language to argue with our spouse, joke with friends, or deceive enemies, the study of these usages is the appropriate focus of sociolinguistics.

Soviet Anthropology

Technically, Soviet anthropology is taken to have encompassed the time span of 1917–1992, although at its beginnings it was in a multitude of ways an extension of the earlier Russian imperial anthropological project and its dissolution, whether institutional or discursive, was a process that stretched well into the early 21st century. The development of Soviet anthropology as a field of knowledge was at times in sync and at times at odds with the development of the discipline in major Western traditions; however, due to reasons stemming from the isolationist stance of the Soviet state, the discipline assumed a specific institutional shape and intellectual trajectory in the Soviet context.

Defining the Field

A caveat to keep in mind is that the term *anthropology* (*antropologiia*) never came to be used in Soviet scholarship as a rubric for the wider domain of inquiry into human culture. It remained restricted by and large to physical anthropology. The research area roughly corresponding to that of cultural/social anthropology was termed *ethnography* (*etnografiia*). This was the official institutional designation of the discipline from the mid-1930s through the early 1990s. During the 1910s–1920s, the term *ethnology* (*etnologiia*) had also been in use on par with *ethnography*, and there had been heated debates over which one should be accepted as the formal disciplinary title. Propositions for seeing "ethnology" as more theoretical and comparative and "ethnography" as more descriptive were typical of the time; but a clear consensus over the meaning was not reached. As a result of the ideological cleansing campaign of 1929–1932 in Soviet academia, the idea of ethnology was eventually censured as an ersatz social science conflicting with Marxism. "Ethnography" remained a valid designation, but its scope was narrowed down, and it was de facto downgraded to the status of "supplementary historical discipline," which it would carry through the end of the Soviet period. The 1929 Conference of Moscow and Leningrad Ethnographers and the 1932 All-Russian Archaeology-Ethnography Conference were important events instrumental in setting the direction for this particular development of the discipline.

For the reasons above, institutionally, Soviet anthropology was shaped nearly from the outset as a branch of the humanities (rather than the social sciences, as was the case with the discipline in the United States, Great Britain, and France at the time). It also inherited much of the ethos of 19th-century Russian anthropology, which had been heavily

affected by German scholarship and had already developed in many ways as *Kulturwissenschaft* (i.e., an emphasis on historical, linguistic, and geographical connections rather than on biological [*Naturwissenschaft*] or social [*Sozialwissenschaft*] ones). Additionally, there was a focus on peasants, their vernaculars, and folklore as bearers of the "cultural spirit" and "national roots," similar to the German *Volkskunde*. The early conceptual and ideological split between ethnography and physical anthropology in Russia of the latter half of the 19th century contributed to the divergence of these fields in the Soviet period. Although there were attempts to bring *etnografiia* and *antropologiia* into more integral contact, such as in Dmitrii Anuchin's activities at Moscow University in the 1910s–1920s, physical anthropology was subsequently (in 1930) institutionalized as part of the biology division within the Soviet university structure.

The 1920s and 1930s

The decade of the 1920s is often credited as the most pluralistic period in the development of Soviet anthropology, when learning established in the institutional centers of the former Russian empire coexisted with new Soviet educational and research initiatives. Older centers, such as the Academy of Sciences, the Ethnographic Division of the Russian Geographical Society, and the Ethnographic Department of the Russian Museum in Leningrad (Petrograd before 1924), or the Society of Devotees of Natural Science, Anthropology, and Ethnography in Moscow, still continued to provide intellectual guidance. The newer ones, such as the State Academy of the History of Material Culture or various commissions instituted under the auspices of the Academy of Sciences (Slavic Commission, Commission for the Study of Tropical Countries, etc.), developed bolder and more innovative research initiatives.

Courses in anthropology were rather widely taught across the country during the 1920s, even though there were but a few dedicated anthropology units in universities. Teaching at the Department of Geography and Ethnography, which had been established at St. Petersburg University in 1887, was supplemented in 1919 with a newly institutionalized ethnographic department at the State Geographic Institute (in 1925, it merged with Leningrad State University). At Moscow University, where the discipline had been previously taught within the confines of the Faculty of Geography, there occurred a series of reorganizations; as a result, the Department of Physical Anthropology, chaired by Anuchin, branched off in 1919, while the teaching of ethnography was moved in 1922 to the new Ethnological-Linguistic Division, which formed the ethnological faculty in 1925 (later closed down in 1930). The Department of Ethnography would be reestablished at Moscow State University in 1939, with Sergei Tolstov as chair, now as a subdivision of the Faculty of History. The teaching of ethnography at Leningrad State University would be likewise confined to the Faculty of History later in 1949 with the launch of the Department of Archaeology and Ethnography (Department of Ethnography and Anthropology since 1968; headed by Rudolf Its). The two departments would basically remain the principal centers of anthropological education throughout the Soviet period. During the decade of the 1920s, however, anthropology was still taught beyond these institutions by a plethora of talented scholars, such as Sergei Shirokogorov at Vladivostok University, Vladimir Arseniev at Vladivostok Pedagogical Institute, Sergei Rudenko at Tomsk University, and Bernhard Petri and Georgii Vinogradov at Irkutsk University.

From the earliest days of the anthropological discipline in the Soviet context, its applied aspect was brought to the fore. The Soviet state faced the tasks of managing the multiethnic landscape of the former Russian empire, forging a new nation, consolidating it ideologically and culturally, and modernizing it. Ethnographic knowledge took on a new relevance. A number of organizations—such as the Commission for the Study of the Tribal Composition of the Population of the Borderlands of Russia (also known as KIPS, 1917), the Central Ethnographic Bureau (1922), or the Committee for the Assistance to Peoples of the Northern Borderlands (1924)—were established to provide expert knowledge in matters related to social and administrative policies, political and geopolitical decisions, population census and statistical research, nationality and ethnic minority issues, and cultural advocacy. Many prominent anthropologists of the time took an active part in these organizations. The impact of knowledge paradigms produced as a result of the activities of these organizations was in fact more profound than the influence of research and teaching units, and

it had more enduring effects on the ways in which the goals of ethnography would be conceptualized throughout the Soviet period.

The focus on classificatory issues, nationality and minority rosters, and the predicaments of "primitive," "classless," or "precapitalist" cultures that was characteristic of Soviet anthropology of the 1920s and early 1930s gradually gave way to the preoccupation with research on so-called ethnogenesis (*etnogenez*)—that is, the study of the origin and historical development of peoples and cultures. This turn, on the one hand, was theoretically prepared by Nikolai Marr's ambitious program of fusing linguistics, ethnography, and archaeology into a universal discipline for inquiry into human history. On the other, it was ideologically propelled by the political goal of demonstrating the historical authenticity of peoples and cultures making up the Union of Soviet Socialist Republics. Although initially, the most important rationale behind the ethnogenesis studies was to scientifically substantiate the priority of Slavic roots and the foundational role of the Russian nation, eventually, during the 1950s–1970s, the scope of applicability of *etnogenez* methods in anthropology was expanded onto the wider cultural map of the world. *Etnogenez* was essentially the first major theoretical paradigm developed within Soviet anthropology, and it never lost its currency up to the formal end of Soviet academic scholarship.

The 1940s and 1950s

Studies of cultural development within the ethnogenesis paradigm led to the elaboration in the 1940s–1950s of the second significant theoretical model in Soviet anthropology—that of *economic-cultural types* (*khoziaistvenno-kul'turnye tipy*) and *historical-cultural areas* (*istoriko-etnograficheskie oblasti*). Maksim Levin and Nikolai Cheboksarov were among its principal initial proponents, but the general idea was further followed and developed by other scholars, such as Gennadii Markov at Moscow State University, up through the 1980s. This model was an attempt at building a universal explanatory framework combining cultural, historical, economic, and geographical criteria. It classified the known human universe into sets of economic-cultural types (patterns of economy and culture historically formed in particular geographical environments) and historical-cultural areas (regions marked by shared cultural traits and cultural continuity). Although innovative in the Soviet context, the model carried various similarities to the culture area concept in early-20th-century U.S. anthropology and the cultural ecology ideas of that time. It also drew intellectually on the earlier German *Anthropogeographie* tradition. The prominence of the model diminished in late Soviet anthropology as it began to be contested by the newly introduced *ethnos* theory.

The theoretical paradigms of ethnogenesis and economic-cultural types in a sense complemented each other and rounded off the synthesis of Marxist evolutionism and geographical-spatial mapping that was characteristic of mid-century Soviet anthropological thought. Diversity was conceptually understood as present and positioned both on the lateral plane, as a distribution of ethnic groups in geographical space, and along the vertical axis, as their progression in time on the ladder of Marxist historical formation stages. The theory of economic-cultural types was designed to explain that there was a reason for an ethnic group to exist in this or that particular space; just as the ethnogenesis theory was meant to prove a reason for an ethnic group to be in this particular social time and not another. Physical anthropology was ethnography's ally in this research endeavor as it elaborated the evolutionary and geographical taxonomy of humankind's races. The 18-volume grand series "Peoples of the World" (*Narody mira*) published in the 1950s–1960s was a testament to the flourishing of these approaches in Soviet anthropology. Despite their shortcomings, studies in ethnogenesis and economic-cultural types were helpful in bringing ethnography in close collaboration with history, archaeology, linguistics, and geography.

The 1960s and After

The late 1960s–1980s are often informally referred to as the "Bromley era" in the history of Soviet anthropological knowledge. The postwar Soviet Union witnessed the centralization of academic research and the rise of the institutional importance of the Academy of Sciences. Consequently, the Institute of Ethnography at the Academy of Sciences gradually emerged as the leading institution setting research objectives and trends in Soviet anthropology. Yulian Bromley, who directed the institute for nearly a quarter of a century (1966–1989), having replaced Tolstov, made

both intellectual and administrative contributions that essentially resulted in the change of dominant research paradigms in the discipline. Bromley is usually credited with the introduction of the concept of *ethnos* into the theoretical vocabulary of Soviet anthropology. The concept, which had been actually developed by Nikolai Mogilianskii and Sergei Shirokogorov in the 1910s–1920s, was reintroduced and reworked by Bromley and his collaborators to become the key idea in anthropological discussions of the 1970s–1980s. *Ethnos*, in its most general definition, was taken to mean a historically formed community of people who possessed common and relatively stable cultural traits and who were aware both of their unity and of their difference from other similar communities. A shared territory and a common language were usually stipulated as the necessary criteria for the existence of ethnos; and it was held to be a unit capable of self-reproduction. In a sense, ethnos was a unified concept meant to replace rather freely and interchangeably used notions such as "people" or "ethnic group."

The reintroduction of ethnos into the anthropological discourse had many far-reaching consequences. It resulted in a variety of theoretical and rhetorical shifts, as it displaced, devalued, or at any rate contested the notions of culture, people, or society in anthropological analysis. It also led to the intellectual and administrative branching of the discipline, which witnessed the emergence of an array of research subfields during the 1970s–1980s ("ethnosociology," "ethnodemography," "ethnopsychology," "ethnoecology," etc.). Most of these subfields were intellectually fashioned after the corresponding research areas in Western anthropology, such as psychological anthropology, ecological anthropology, and the like, but they employed terminologies recast or modified in accordance with the new ethnos language.

The part that the ethnos concept played in shaping late Soviet anthropology was equivocal. On the one hand, the concept helped the discipline reinvent its academic vocabulary. It essentially allowed it to enter the theoretical domain of political science. It opened the discipline toward other social sciences and stimulated theoretical debates generally. On the other hand, as the concept gradually acquired the status of foundational notion and basically turned into a required starting point for any anthropological analysis, it began constricting the scope of anthropological inquiry in the 1980s. By inertia, it still kept severely constricting it during the first post-Soviet decade. All in all, the major strengths of Soviet anthropology lay not so much in theoretical formulations as in empirical research on the culture and lifeways of ethnic groups residing within the political borders of the USSR, with the school of studies of the North and Siberia being arguably its consistently strongest branch.

Spencer, Herbert

Herbert Spencer (1820–1903), British philosopher, sociologist, social theorist, and anthropologist, was

one of the most prominent and influential propagators of evolutionary theory in the 19th century.

Biography and Major Works

Herbert Spencer was born in Derby, the eldest and only surviving son of a headmaster. Clearly influenced both by his father and, more generally, by the stimulating nonconformist culture of Derby in the early 19th century, with its emphasis on the importance of radical reform, free trade, technical skill, scientific exploration, and a rational approach to religion, he also reacted against both of these influences. In particular, despite a clear and continuing interest in what he called "the Unknowable" throughout his life, Spencer rejected his father's more conventional belief in God and was only partially influenced by Derby's experimental culture, preferring theorizing over practical experiment. This was a preference to which he constantly adhered, despite a wide-ranging education under the tutelage of his uncle the Rev. Thomas Spencer, which included studying Latin, Greek, French, algebra, chemistry, physics, and political economy, and the practical experience of working as a civil engineer for various rail companies. Although he possessed considerably more genuine practical experience than many of the London intellectuals with whom he became associated, including John Stuart Mill, Thomas Henry Huxley, and Harriet Martineau, Spencer, from early on, tended to use information to confirm his initial hypotheses, rather than being genuinely open to empirical correction.

After refusing a permanent post on the Birmingham-Gloucester railway in 1841, Spencer drifted for several years, interesting himself in everything from phrenology to political economy, although his ambition was increasingly to become a journalist and an influential commentator. This he began to achieve after his appointment as subeditor of *The Economist* after 1848, and especially after he published "The Development Hypothesis" and "A Theory of Population" in 1852. The former article in particular, allegedly produced in reaction to Charles Lyell's claim in *The Principles of Geology* (1830–1833) that species were essentially fixed, and praised by Charles Darwin, marked an important moment in Spencer's career, since it was the first influential statement of Spencer's belief in evolution. Important, too, was his second book, *The Principles of Psychology* (1855), which argued that the workings of the mind could all be explained by fixed material laws associated with evolution, and which caused considerable controversy among the London intelligentsia, even before the publication of Darwin's *The Origin of Species* in 1859. But it was only in 1860 that Spencer was able to settle down to developing the implications of what he called his "synthetic philosophy" on a full-time basis—namely, the attempt to explain systematically how materialist laws could explain not only the nature of evolution and the workings of the mind but also how societies developed, how morality operated, and even how political life should be organized. Before he could do so, however, Spencer had to recover from a shattering nervous breakdown in 1855, which meant that he could only ever work for 3 hours a day at most. Spencer's breakdown might have resulted in considerable financial difficulties, but he was fortunately saved by the intervention of an American admirer, Edward Youmans, who successfully marketed Spencer's writings in the United States and hence secured him a regular income for the rest of his life. An important popularizer, Youmans not only encouraged the reading of Spencer's existing works but also commissioned him to write more than 90 articles for his magazine, *Popular Science Monthly*. Ultimately, Spencer's work was to be translated into a wide variety of other languages, including French, German, and Russian.

The next 40 years, then, from 1860, were to see Spencer tenaciously working on his synthetic philosophy. During this period, he worked only in the mornings, before retiring to his club, the Athenaeum, and then dining alone or with friends—including John Tyndall, the well-known physicist, and the positivist G. H. Lewes. Given his rather selective use of evidence, which was generally cited only to support his arguments, it was perhaps not surprising that he avoided contact with those who disagreed with him, and tended to avoid public controversy—although he did join other liberals, including Mill, Huxley, and John Bright, in trying to convict Governor Eyre for his brutal suppression of the Morant Bay rebellion in Jamaica in 1865. But Spencer's main focus was clearly his work, and in 1862, he produced the influential *First Principles*. In the first part, he sought to prove that the burning contemporary conflict between science and religion essentially rested on false premises, while, in the second, Spencer drew

on a variety of sources, including the idea of the "persistence of force," Darwin's theory of natural selection, and Jean-Baptiste Lamarck's theory of use inheritance, among others, to claim that all progress could be explained by viewing it as the reorganization of currently existing matter into structures of greater complexity and heterogeneity. This theory was applied by Spencer to most aspects of human life in the 1860s and 1870s. His books *The Principles of Biology* (1864–1867), *The Principles of Psychology* (1870–1882), *The Principles of Sociology* (1875–1885), and *The Principles of Ethics* (1879–1893) enjoyed considerable popular and critical success. In these years, he declined many honors, including many honorary degrees and a probable fellowship of the Royal Society, at least in part because such recognition would have compelled him to defend his views more publicly, a prospect Spencer detested. But the last years of his life were to be ones of struggle and disappointment, particularly due to developments in biology, which raised serious questions about whether acquired characteristics could be directly inherited in the way Spencer (and before him Lamarck) had claimed. Given Spencer's general refusal to debate and to conduct empirical laboratory research, he was ill equipped to respond to the many criticisms made of his work by leading evolutionary theorists such as Huxley, A. R. Wallace, and D. G. Ritchie, and he died a disappointed man in 1903.

Critical Contributions to Anthropology and Sociology

Spencer's contribution to anthropology and sociology was both influential and controversial. Spencer attempted to combine Lamarckian and Darwinian insights to produce an entirely comprehensive system. This work can be divided into three parts: an argument (1) for a particular conception of evolution, (2) for how human minds evolve, and (3) for how society in general operates.

The Nature of Evolution

Influenced early in his career by Karl von Baer's claim that an analysis of embryos showed that heterogeneous structures arise from more homogeneous ones, Spencer sought to develop this insight into a more general law. Thus, already in the 1857 essay "Progress," published in the *Westminster Review*, Spencer claimed that the "law of organic progress" showed that all development, whether it be physical, biological, or social, including that of language, literature, science, and art, exhibited a tendency to develop from the homogeneous to the heterogeneous, and under the influence of Coleridge's essay "The Theory of Life," he increasingly equated this tendency with a move toward greater coherence and integration. Ultimately, by the time he wrote *First Principles*, Spencer claimed that this tendency was based on three physical laws. First, the "persistence of force" ensured the disruption of the equilibrium of the universe, since forces were acting unequally at different points within it. Second, because each force has more than one effect, the effect was a multiplication of effects and hence a tendency to heterogeneity. Finally, the "rhythm of motion" meant that progress was not uniform, so that within the overall evolutionary trend to greater sophistication and complexity, retrogressions could occur. Such processes were bound to continue, Spencer maintained, until a final "equilibrium" was achieved, and thus (he argued), there was always a tendency to equilibrium in any situation. On this basis, he argued not only in favor of a Lamarckian process whereby organisms directly adapted to their environment to promote such "equilibrium" but also, somewhat reluctantly, in favor of Darwinian natural selection after the publication of *The Origin of Species*. Natural selection or "indirect equilibration" was explained by the variations that occurred in organisms due to the secondary and tertiary effects that occurred due to adaptation to a new environment—so that when the environment changed, those members of the species the least well adapted to the new circumstances would fail. Direct adaptation, therefore, according to Spencer, explained the modifications of individual organisms; natural selection explained the modification of species. Given his reluctant adoption of the Darwinian side of the process, it is somewhat ironic, in these circumstances, that the single phrase Spencer is most associated with is "the survival of the fittest"—a term he first coined in *The Principles of Biology* and that sounds thoroughly Darwinian. For rather than explaining the nature of evolution with reference to the production of random variations, as Darwin does, Spencer insisted that *in fact* such variations were only apparently "random" and could be explained as the reverberating effects of distant primary causes in the evolutionary system, alongside the effects of direct (Lamarckian) adaptation. His position was thus importantly distinct from Darwin's.

The Nature of the Human Mind and Race

Having formulated his conception of how evolution works, Spencer then sought to apply it to the workings of the human mind, especially in *The Principles of Psychology*. Essentially, he argued that the mind operates as a means by which an organism can better adapt to its environment, which gradually increases in sophistication in accordance with evolutionary laws. Thus, reflex action, instinct, memory, and reason simply represent the increasing sophistication with which human organisms can adapt to the world around them. Key to Spencer's conception of human development was the idea that although human minds were subject to immediate external pressures—to which they adapted—they were also heir to an evolutionary tradition of adaptations. This meant, Spencer claimed, that rather than individuals having to learn everything anew from experience, each generation began with an inherited set of predispositions and indeed ideas. And this was important, because it implied that for Spencer, the fundamental category for anthropological analysis was the *race*, not the individual—with the result that, like his contemporaries Huxley and John Lubbock, he was insistent on the superiority of the "higher" European races over the "less developed" African ones. In particular, he claimed that increased heterogeneity within a race implied a lower birthrate, so that the lower fertility rates among Anglo-Saxons compared with Africans was clear evidence of their racial superiority. This was because, Spencer argued, greater individuation implied a lower birthrate—not the least because more developed races were better able to make more abstract and far-sighted decisions. However, he also rejected straightforward accounts of evolutionary development, such as that given by the contemporary anthropologist Edward Burnett Tylor, which posited a simple hierarchy of stages through which all races had to pass. Rather, due to the Lamarckian side of his thought, he stressed the interplay between biological and cultural factors in human development, which rendered his account of human development considerably more subtle—and indeed led to him supporting the rights of the "lower races," as at Morant Bay.

The Nature of Society

Beyond the contrast between "races," Spencer's conception of mind and race had implications for his analysis of both past and contemporary societies. Although in his early work, such as *Social Statics* (1850), he advocated liberal feminist positions, including giving women the right to vote, and criticized the "tyranny" of marriage, his increasing stress on the biological sources of mental development led him to more illiberal conclusions in his later work. Key to understanding the nature of women, he argued latterly, was their role in bearing children, which meant that they achieved maturity earlier and hence had a smaller nervo-muscular system, resulting in a lower capacity for the most recent evolutionary achievements, namely, a capacity for abstract thought and for setting aside personal dislike in favor of justice. More generally, Spencer also sought to draw wider conclusions about the nature of primitive and modern societies. In particular, he argued that social evolutionary pressures would cause a progressive differentiation of functions, so that primitive "militant" societies (where the only real differentiation is between rulers and ruled) gradually give way to "industrial" ones, where the component parts have become increasingly heterogeneous but are held together by a spontaneous cooperation founded on an elaborate division of labor. If, according to Spencer, in militant societies, the social structure is characterized by a strong emphasis on social status, heredity, rigidity, control, and lack of respect for private property, in industrial societies, he maintains, it is characterized by equality of opportunity, democratic institutions, a minimal state, and a respect for others characterized by the strong upholding of abstract conceptions of justice. The result, which Spencer fervently hoped for, was not atomic individualism but rather a society where the possibility of voluntary social cooperation was maximized as much as possible.

Spencer, Walter Baldwin, and Francis James Gillen

Walter Baldwin Spencer (1860–1929) and Francis James Gillen (1855–1912) are the most famous Australian anthropologists of the 19th-century. Their disparate backgrounds as university scientist and administrator and as post office official, respectively, did not hamper their equal partnership and their work among the Arrernte of central Australia.

Biographies and Major Works

Spencer was born in Lancashire, England, in 1860 and studied at Owens College (Victoria University of Manchester) and the University of Oxford, where he read natural sciences under Henry Nottidge Moseley (1844–1891). After graduating, he worked as Moseley's assistant; one of his principal tasks was to organize the transfer of the famous Pitt-Rivers collection to the University of Oxford from London, which fed his nascent interest in anthropology.

In 1886, he became the founding chair of biology at the University of Melbourne, a post he held for the rest of his working life. In 1894, he was invited to take part in the Scientific Exploring Expedition into central Australia funded by William Austen Horn (1841–1922), acting as its biologist. When the expedition's camel train reached Alice Springs, he met Francis James Gillen for the first time.

Frank Gillen was born in South Australia to a family of Irish immigrants; he entered public service in 1867 as a postal messenger, after a limited education. He later worked as a telegraph operator and studied in the evenings at the South Australian School of Mines and Industries. His first trip into the outback was in 1875, during which he wrote a journal about his work and encounters with Aboriginal people (for his own pleasure) and created vocabulary lists to help his communication with them. These activities can be seen, with hindsight, as the beginnings of his anthropological investigations. Gillen continued to work at remote telegraph stations until 1892, when he was appointed telegraph station master at Alice Springs, in the very center of Australia.

On the surface of things, Spencer and Gillen were very different people: Spencer was trained at one of the foremost universities in the world and was witty, urbane, polished in manner, and well connected to the metropolitan center and intellectual elites. Gillen was the de facto ruler of a small but incredibly remote European settlement in the center of a large, arid, little explored continent. He, too, was quick-witted and funny, but ill educated, modest, and untraveled outside Australia. However, the two men rapidly became very close friends: Their professional partnership flourished from the first day they met, when they collaborated on the preparation of anthropological data for the Report of the Horn Expedition, until 1912, when Gillen died prematurely after a long illness.

The pattern of their partnership was set early. Gillen was, in effect, engaged in permanent "fieldwork" (as later anthropologists would call it) as he was able to fit in daily investigation alongside his job as stationmaster. He compiled long notes on specific topics, often suggested by Spencer, with the help of his local informants. These "budgets" of notes were sent back at frequent intervals across thousands of miles to Spencer in Melbourne, who would use them as the basis from which to craft their early monographs. Gillen's relations with the local Arrernte were particularly close and friendly, which greatly helped their endeavor.

Spencer's major contributions to the joint endeavor were his wide readings in 19th-century anthropology, his understanding of scientific methodology, and his ability to write in a style suitable for publication. Gillen's letters to Spencer, published in 1997, make it clear that he too was a gifted writer, but, sadly, his lack of confidence in academic matters (despite Spencer's encouragement) meant that Spencer was always seen as the lead partner in their publications. However, the bulk of their field observation can be attributed to Gillen. He brought more than 20 years of knowledge and experience of central Australian life to the partnership, a crucial contribution and a nice balance to Spencer's skills.

Gillen and Spencer were fortunate enough to be present at a lengthy series of then rarely held Arrernte ceremonies, close to the Alice Springs Telegraph Station in the winter of 1896–1897,

which the anthropologists called the *Engwura*. Gillen facilitated the arrangement for this series of ceremonies (a huge drain on the limited food and raw material resources of the area) and attended almost all the ceremonies. Spencer traveled back to the geographic center of Australia to witness some of the action during his Christmas long vacation. This rare opportunity was the central event in their first major publication, *The Native Tribes of Central Australia* (1899), an instantly successful monograph that was to prove very influential on many metropolitan anthropological thinkers, including James G. Frazer (who had helped proofread the monograph) and Émile Durkheim.

In 1901, the partners traveled north from Adelaide in South Australia to Borroloola in the Northern Territory for an entire year, investigating all the way. During their travels, they recorded wax cylinders of song and speech and shot films of reconstructed ceremonies with local groups' consent (using light levels at night and camera technology not allowing the actual ceremonies, which they also attended, to be recorded). They noted data about material culture, kinship patterns and social organization, and religious beliefs and ceremonial practice for all the peoples they met along the way. This work was published in their second monograph, *The Northern Tribes of Central Australia* (1904).

They carried out a further short period of fieldwork near Lake Eyre in 1903. This was an attempt to test one of their theories regarding increase ceremonies and other religious beliefs, and it was their last period of joint fieldwork. Gillen reluctantly moved to become postmaster in several places in southern South Australia in 1899, for the sake of his growing family, who needed a larger income and better access to education. This effectively put an end to Spencer and Gillen's fieldwork. After many years of ill health, Gillen died in 1912 from a neurological disorder.

Spencer continued to use the copious field notes that Gillen had sent from Alice Springs between 1894 and 1899 and the notes from their joint field investigations to prepare a series of further publications, under their joint names or Spencer's alone, that, without Gillen's deep knowledge of Aboriginal culture and society, became increasingly questionable. In particular, it has become apparent that although Gillen was not entirely fluent in Arrernte (or any other Aboriginal) language, he was much more familiar with it and had a deeper understanding of it than has been appreciated heretofore. His language lists and those published in the first two monographs (largely reflecting his own understanding) are much more accurate and nuanced than Spencer's later orthographies in publications after Gillen's death.

Spencer became one of Australia's most eminent scientists and university administrators in the early 20th century. He traveled back to central and northern Australia in 1912, when he was appointed chief protector of Aborigines in Darwin for a year, and in 1923 to prepare a government report on Aboriginal welfare. In 1927, he returned to England. His final anthropological fieldwork took place in Tierra del Fuego in 1929, and he died and was buried in Punta Arenas during this last expedition.

Critical Contributions to Anthropology

Spencer and Gillen carried out the first long-term fieldwork in Australia and were also the first to introduce several technological innovations in fieldwork practice in that country. These included recording ceremonies on film and glass photographic slides and recording sound on wax cylinders. Taking place at a time when fieldwork methodology had not yet been worked out, their techniques were exemplary. Data were sought from key informants, checked and rechecked with other informants, and recorded first into rough field notebooks, then transcribed into fuller accounts at the end of the day, before being analyzed and presented in their published monographs. Their joint fieldwork methodology was (and is) unusual: carried out by two equal partners, sometimes working in unison (e.g., when recording, photographing, and filming ceremonies) and sometimes independently when separated by many thousands of miles and dealing with the complicated (and hideously slow) communications technology of the 19th and early 20th centuries. Many of their fieldwork practices are discussed in more detail in the edited volume of their letters, *My Dear Spencer* (1997), and in John Mulvaney and J. H. Calaby's *So Much That Is New* (1985). Their fully collaborative partnership used both of their strengths to full advantage and has ensured that their fieldwork and publications have remained of interest to the present day. They disseminated their findings not only through

published monographs but also in public lectures that they both gave throughout Australia, which did much to introduce 19th-century urban Australians to their Aboriginal countrymen.

Their two major publications in 1899 and 1904 were extremely influential for early-20th-century anthropology. They are credited with being the first to start to understand and explain the importance of Aboriginal cosmological and religious beliefs. The full significance of their field notes, photographs, letters, and journals is still being investigated today.

It has been claimed that Gillen and Spencer amassed what is perhaps the most influential collection of Australian ethnographic material ever assembled. Because they were very seldom geographically proximate, they were forced to carry out their thinking and data exchange by correspondence. This collection of data was, in the main, fortuitously retained and transferred to the care of at least 20 institutions worldwide, meaning that their methodology and raw data are particularly clear and accessible. An unusual aspect of these field records is that they range from the immediate field jotting to more worked-up text in their journals and notes. Taken together with the large number of photographs and field recordings, the collection gives a wide-ranging view of Arrernte, Anmatyerr, Kaytetye, Warumungu, Luritja, and Arabana lives in the late 19th century.

They also made extensive collections of material culture at a time when European influence on Aboriginal culture in central Australia was still minimal. These collections are now also dispersed throughout the world and include some of the most important artifacts ever to be collected from central and northern Australia. Their collections of material culture may have led to one of the more interesting digressions of Spencer's professional career, when he was appointed honorary director of the National Museum of Victoria in Melbourne in 1899.

Gillen and Spencer's immediate contribution to world anthropology was the delineation of "facts" about Aboriginal life and social organization that revolutionized anthropology at the time. Émile Durkheim, for example, based much of his *Elementary Forms of Religious Life* (1912) on the data they had presented in *The Native Tribes of Central Australia*; Frazer used their data to augment his own work on totemism. Their publications even had strong influences beyond anthropology, with Sigmund Freud being inspired by their work in writing his book *Totem and Taboo*.

Spencer and Gillen's Legacy

Perhaps the most important element of Spencer and Gillen's work was their systematic recording of field data on a very wide range of topics. Australian anthropology is fortunate that so many of the earliest European residents to live in "the outback" were interested in anthropology. Gillen was one such, but he was helped in his endeavor by his extraordinarily close relationships with the local Arrernte. This in turn fostered close relationships with other Aboriginal groups, coming out of his humane and friendly treatment of local people and his courageous decision to stand up against the harshly punitive treatment of locals by the South Australian police force. This led to a much wider disclosure of restricted information than would have been possible for most investigators. However, Spencer and Gillen's conclusions and theorizing from their field data have perhaps had less lasting impact than their raw data.

Subsequent changes in outback administration and the consequent deleterious effects on Aboriginal life make their early field records and material collections exceptionally useful historical records for local communities and anyone interested in 19th-century Australia, and also as anthropological raw data. They are also a vital cultural record for the descendants of the Aboriginal people with whom Gillen and Spencer worked in central Australia.

Perhaps a legacy that should be recognized by anthropologists today is Spencer and Gillen's approach to team anthropology. The sum of their contributions was so much greater than either man could have achieved on his own.

Sperber, Dan

Dan Sperber (1942–) is a French anthropologist and cognitive scientist who has made major theoretical and empirical contributions to anthropology, linguistics, psychology, and philosophy. These contributions are varied and often discipline specific—ranging from a major and highly influential reframing of linguistic pragmatics, to a large body of innovative experimental studies in cognitive psychology, to a pioneering reconstrual of anthropology as a cultural epidemiology. Still, common throughout Sperber's work is an abiding concern with the nature and natural history of cultural environments.

Early Life, Education, and Professional Positions

Sperber was born in Cagnes-sur-Mer in 1942, in the Southern Zone of France prior to its occupation by German troops. His mother, Zenija Zivçons, born in Latvia, and his father, the German-language essayist and novelist Manes Sperber, born in Galicia (then part of the Austrian Empire), met in Paris in the mid-1930s, which they fled ahead of German occupation in 1940. A few weeks after Dan's birth, by which time deportations of Jews had begun in the Southern Zone, they again fled, this time to Switzerland, where they remained for 3 years as refugees. At the end of the war, they returned to Paris, where Sperber has lived ever since, except for temporary absences for fieldwork and while holding visiting positions abroad.

Sperber studied sociology at the Sorbonne, earning a Licence ès Lettres in 1962. He then began doctoral studies (which he never completed) with Georges Balandier on African political anthropology. In 1963, he was awarded a studentship at Nuffield College, Oxford, where he studied anthropology first under the supervision of Godfrey Lienhardt and later under Rodney Needham. In 1968, he was awarded a BLitt in anthropology by Oxford—his highest degree. By 1965, he had returned to Paris and was appointed to the Centre National de la Recherche Scientifique, where he spent his entire career until mandatory retirement in 2008. Sperber was initially attached to Georges Balandier's Laboratoire d'Études Africaines. In 1968, he moved to the Laboratoire d'Ethnologie et de Sociologie Comparative at the University of Paris X; in 1988, he joined the Centre de Recherche en Epistémologie Appliquée at the École Polytechnique; and in 2001, he moved to the Institut Jean Nicod, which is jointly sponsored by the École des Hautes Etudes en Sciences Sociales and the École Normale Supérieure. Sperber is currently emeritus research professor at the CNRS in Paris and is also recurrent visiting professor in the departments of philosophy and of cognitive science at the Central European University in Budapest. In addition to these permanent posts, Sperber has held visiting positions at Cambridge University, the British Academy, University College London, the London School of Economics, the Van Leer Institute in Jerusalem, The Institute for Advanced Study in Princeton, Princeton University, the University of Michigan, the University of Hong Kong, and the University of Chicago.

Critique of Symbolic Anthropology

Sperber conducted 18 months of fieldwork among the Dorze of southern Ethiopia between 1968 and 1974, focusing on their complex system of taboos and on related ritual practices. Although he has

published only a few ethnographic articles based on this fieldwork, the analytic conundrums he encountered during the fieldwork have surfaced tantalizingly, albeit briefly, in later writings. To date, the bulk of Sperber's writing remains theoretical, focusing on the common foundations of the social and the cognitive sciences. Sperber attracted sustained attention with the appearance of *Rethinking Symbolism* in 1975. In it, he argued against the classical view of cultural symbols as signs conveying a meaning. *Rethinking Symbolism* challenged the emerging symbolic turn in anthropology championed by, among others, Clifford Geertz, David Schneider, and Victor Turner, who interpreted cultural forms as symbolic systems meant to be "read" as texts. Rather, Sperber suggested, the function of cultural symbolism is to elicit a cognitive response of evocation that varies with individuals and contexts. The very success of cultural symbols, he argued, is linked to the fact that they allow this variety of responses. In *On Anthropological Knowledge*, where Sperber argued for a naturalistic approach in anthropological theory, he expanded this critique of interpretive approaches, arguing that the seeming irrationality of many cultural forms (e.g., belief in ghosts) should be analyzed and reduced not so much through the ethnographer's reinterpretation but rather by discovering the cognitive mechanisms that the people who hold these beliefs actually employ and by identifying the social mechanisms of their acceptance and propagation. Among the cognitive mechanisms involved, he claims, is a cognitive attitude to these apparently irrational beliefs that treats their content not as mere facts but as shared representations open to reinterpretation, ensuring that the belief is shared even while its interpretation is not.

Sperber's theory of symbolism and his admonitions for a naturalistic and theoretical anthropology represented a direct challenge to the increasingly dominant symbolic turn in American anthropology of the 1970s and 1980s. The symbolic turn itself was a response to the long-prevailing conviction that anthropology's principal concern was the analysis of social structures and their imbrications into myriad cultural realms. Symbolic anthropologists, led by Geertz, snidely derided this approach—imbued as it was with an admiration for the natural sciences—as "social mechanics." To a significant degree, the symbolic turn was carried in the wake of a renewed, deep, and more reflective commitment to cultural relativism. Unsurprisingly, Geertz's highly influential statement was titled *The Interpretation of Cultures*, not "The Interpretation of Culture." Geertz and others sympathetic to his position were not proposing a theory that accounted for culture but rather a strategy for faithfully and persuasively conveying the particular experiences of a particular cultural tradition by decoding the meanings encoded in cultural symbols. Sperber's challenge to this program was unsurprisingly controversial; indeed, Geertz, in his Distinguished Lecture to the American Anthropological Association (published as "Anti Anti-Relativism" in 1984 in the *American Anthropologist*), explicitly attacked Sperber's call for a naturalistic anthropology.

Metarepresentation, Modularity, and Communication

After *Rethinking Symbolism*, and partly under the influence of Noam Chomsky's proposal for an innate language faculty and Jerry Fodor's *The Modularity of Mind* (1983), Sperber began exploring the notion that, rather than relying on a single, general learning ability (for social learning), the acquisition and transmission of culture exploited many domain-specific mental mechanisms, or modules. The extensive work of Scott Atran on naive biology and Lawrence Hirschfeld on naive sociology well illustrates this type of approach. Sperber himself focused on one type of mechanisms, metarepresentational mechanisms, which specialize in representing representations, in particular mental representations that are apprehended through metapsychological or "theory of mind" modules. Metarepresentations play a crucial role, Sperber argued, in human communication, an area to which he has devoted a great part of his work in collaboration with the British linguist Deirdre Wilson.

In 1986, Sperber and Wilson published *Relevance: Communication and Cognition*, which outlined a comprehensive and innovative approach to linguistic pragmatics. In it, as well as in numerous subsequent articles and most recently in a collection of essays titled *Meaning and Relevance*, Sperber and Wilson developed a cognitive approach that rejects the conventional wisdom that human communication is primarily a process of coding and decoding. Instead, they argue that communication is an inferential process: The communicator provides evidence of his or her meaning, and the addressee infers this

meaning on the basis of the evidence, the context, and considerations of relevance. The role of language in this perspective is not to encode the speaker's meaning but to give rich and precise evidence of it. Relevance theory, as their position has come to be known, is simultaneously the most influential and among the most controversial theories in linguistic pragmatics. It has stimulated a now considerable body of research not just in linguistics but also in psycholinguistics and in philosophy of language. The book *Experimental Pragmatics*, edited by Ira Noveck and Sperber, has been a launching pad for much experimental research in the area, to which Sperber himself has extensively contributed.

Building and expanding on both the modularist approach to mental mechanisms and relevance theory, Sperber has developed a naturalistic approach to cultural phenomena. Beginning with his Malinowski memorial lecture in 1984, "Anthropology and Psychology: Towards an Epidemiology of Representations," and greatly elaborated in his 1996 volume, *Explaining Culture*, Sperber proposes to reframe anthropology as an epidemiology of representations. Rather than interpreting cultural environments in terms of the purported meaning (or more accurately perhaps, the significance) of their (again purportedly) interwoven elements, Sperber suggests exploring the nature, scope, and causes of the distribution of cultural phenomena. In a number of articles, Sperber explores how viewing communication as an inferential process and viewing the human mind as richly modular gives substance to the epidemiological approach to culture.

A Naturalistic Approach to Cultural Environments

In *Explaining Culture: A Naturalistic Approach* and a large number of subsequent recent articles, Sperber expands the notion of an epidemiological approach to cultural representations, tackling at once and explaining (a) how representations are distributed in a cultural environment and (b) how best to characterize culture. On this approach, a human population can be seen as inhabited by a much wider population of mental representations. Most of these are fleeting (the weather in New York at 1:33 p.m. on December 28, 2012), narrowly distributed (the time my daughter managed to get out of bed this morning), and of little interest to most members of the population (what my family had for breakfast today). Cultural and noncultural representations (and productions) differ in that the former are just those representations (and productions) that are widely and stably distributed within a particular population. Cultural analysis, on this view, consists of understanding why some representations become widely and stably distributed—that is, why some beliefs (and practices) are catchier than others. Crucial to such analysis is the realization that there are complex causal chains where mental representations and public productions alternate.

Sperber argues that imitation-based processes function to produce a rough fidelity in content in these complex causal chains, so that widely and stably distributed representations share a *similarity in content* among the productions of various members of a community (two tellings of Little Red Riding Hood are similar enough to be recognized as versions of the same narrative despite the many differences in detail between them). In short, neither communication nor imitation is a replication mechanism through which representations are faithfully copied over time and between individuals. The human ability to understand and to reproduce or adapt another person's action or utterance involves relevance-guided inferential processes of reconstruction as much as processes of decoding or copying.

Not surprisingly, Sperber argues against applying the Darwinian idea of natural selection to explain the relative stability and development of cultural traits, as suggested by the biologist Richard Dawkins and pursued in "memetics." He finds this argument to be based on too simplistic an understanding of the causal processes involved in communication. However, Sperber does argue that the evolution of the psychological dispositions that enable the individual formation and social distribution of representations, namely, domain-specific evolved mechanisms or "modules," is to be explained in straightforward Darwinian terms. (Thus, e.g., Little Red Riding Hood may be widely and stably distributed among many cultural environments because its narrative structure and ontological commitments and their manipulation in the story are more resonant with human cognitive architecture than other similar but less catchy tales.) Several of Sperber's more recent essays are intended as direct contributions to evolutionary psychology.

Collaborations

Sperber's approach powerfully influenced a small group of anthropologists—Scott Atran, Pascal Boyer, and Lawrence Hirschfeld—with whom he has maintained a loose association for more than 3 decades. Their work, on folk biology (Atran), supernatural beliefs (Boyer), and human kinds (Hirschfeld), provides empirical illustrations of Sperber's epidemiological approach; their empirical projects seek to account for specific arenas of cultural life—that is, the broad and often stable distributions of these cultural forms—by focusing on the cognitive mechanisms, particularly special-purposes devices, that seem to have evolved to treat specific kinds of information.

More recently, Sperber has been a cofounder and active member of the Institut Jean Nicod in Paris, a unique research institution at the interface of analytic philosophy and the social and cognitive sciences, which is playing an important role in giving a greater place in French intellectual life to a more analytic approach to philosophy and a more naturalistic approach to psychology and the social sciences. In this institute, Sperber had headed an interdisciplinary group of younger researchers and has collaborated in particular with Christophe Heintz in studying the socio-cognitive basis of scientific culture, with Nicolas Baumard in studying the evolution of morality, with Nicolas Claidière in studying models of cultural transmission in nonhuman animals, with Olivier Mascaro in studying the development of trust and "epistemic vigilance" in young children, with Hugo Mercier in developing a theory of human reasoning as essentially social, and with Olivier Morin in studying the interplay of imitation and communication in cultural transmission. In collaboration with the Department of Anthropology at the London School of Economics, Sperber launched and continues to direct a web forum, the International Cognition and Culture Institute, which maintains several scientific blogs, hosts web lectures, and sponsors webinars.

Honors and Awards

Numerous institutions have recognized and honored Sperber's unique scholarship. Among others, these include appointment as corresponding fellow of the British Academy, foreign honorary member of the American Academy of Arts and Sciences, and member of the Academia Europaea. In 2009, Sperber was named the first laureate of the Claude Lévi-Strauss Prize.

Spiro, Melford

Melford Spiro (1920–) is a psychological anthropologist best known for his work on the psychodynamics of cultural differences. One of the main interlocutors in debates surrounding cultural universalism and

relativism in the mid-20th century, Spiro advocated for the presence of universal processes informing human nature. He saw cultural practices as culturally constituted coping mechanisms that provide a socially acceptable shape to human needs. In a series of ethnographic and theoretical works, he argued against a split between the implied universalism of psychology and the implied relativism of anthropology, arguing instead for what he saw as shared motivational and cognitive structures underlying cultural variation. A lay psychoanalyst, Spiro conducted fieldwork in Micronesia, Israel, and Burma. He is presently professor emeritus at the University of California, San Diego, where he founded the university's Department of Anthropology in 1968.

Spiro was born in 1920 in Cleveland, Ohio, and received his PhD from Northwestern University in 1950. He grew up intellectually in an anthropological climate of cultural relativity, in which culture was seen to mold the psychological structures of human beings, and he became interested in anthropology because he was intrigued by this claim and its implications for social structure. While a student of A. I. Hallowell at Northwestern University, Spiro encountered neo-Freudian psychoanalytic learning theory and became inspired by what the study of deep motivations could offer to the understanding of human behavior.

In 1947, Spiro began his first ethnographic fieldwork project for his dissertation on aggression in Ifaluk, a Micronesian atoll. The topic emerged from his observation that there were few acts of aggression in the atoll, much less than he had expected. During fieldwork, Spiro uncovered hostile impulses at the psychological level, however, that countered the assumption that the lack of violence reflected a lack of thinking about violence. He found hostility present in the answers to his psychological measures and also in folk tales, myths, and religious beliefs, all of which he came to call projective expressions of personality dispositions. He also noticed early-childhood rearing behaviors that seemed to shape behavioral practices of nonaggression. He concluded that universal motivations are displaced (or "projected") onto religious beliefs, narratives, and rituals, where they can be discharged in culturally appropriate ways according to the functional requirements of the society. Spiro's doctoral dissertation demonstrated that nonaggression at the behavioral cultural levels did not reflect nonhostility at the psychological personality level. He found that such hostility was very much present but that it was shaped and elaborated over the course of human development. This provided the first piece of evidence for his theoretical commitment to a universal human nature.

For more evidence, Spiro turned to a new ethnographic project that could provide a comparative perspective. In 1950, he began research on a kibbutz in Israel to study socialization in a quite different kind of society. At the kibbutz, children were raised apart from their parents, in large cooperative social groups. If personality was culture writ small, he thought, the nonaggressive, cooperative learning environment of the kibbutz would produce adults with little hostility. And yet this was not the case: Rivalry and competition emerged instead of, or along with, cooperation. These findings, and their implications, ran counter to Spiro's earliest commitments to psychological relativity, and he began to speak out against theories of cultural relativity in his work on gender and socialization in *Children of the Kibbutz* (1965) and in energetic debates at conferences, in theoretical articles, and at university campuses. And yet if people share psychological similarities everywhere, he continued to wonder, what then explains behavioral differences?

This question led to a long-term interest in religion and to Spiro's third ethnographic project, on Buddhism in Burma. Buddhism served as an intriguing religion for Spiro because of its apparent rejection of ideals common in Western religions. Western scholars had characterized Buddhism as focusing on life as suffering, the rejection of desires, and an absence of selfhood. These ideas were all suggestive of the markedly different cognitive structures orienting human psychology. To study these ideas "on the ground," Spiro conducted ethnographic research in Upper Burma in 1961 and 1962. Surprisingly, he found that instead of living as if desire was to be avoided and that there was no self, people overwhelmingly believed in the self and attempted to have their desires fulfilled rather than eliminated. From this work, Spiro proposed in *Buddhism and Society: A Great Tradition and Its Burmese Vicissitudes* (1971) that people in Burma follow a kind of Buddhism based on either gathering good karma or warding off misfortune, rather than the one based on the elimination of desire and the search for nirvana. This once again confirmed his ideas of a universal psychology.

Spiro's ethnographic research has provided evidence in support of a theory of universal human nature rooted in individual human needs. In the 1966 work "Religion: Problems of Definition and Explanation," he argues for the universal belief in supernatural beings as the basis of religion; in "Postmodernist Anthropology, Subjectivity, and Science: A Modernist Critique (1996)," he points (critically) to the Culture-and-Personality school's subjectivist turn as a precursor to postmodern anthropology; and in "Is the Western Conception of the Self 'Peculiar' Within the Context of the World Cultures?" (1993), he argues against Clifford Geertz's claim of cultural diversity in conceptions of the self. In each piece, universality trumps relativity.

Because of his distinctive position on cultural diversity, his insights into shared human psychological processes, and his commitment to comparative ethnographically based analysis, Spiro's work continues to exert extensive influence in the fields of social, cultural, and psychological anthropology.

Srinivas, M. N.

M. N. Srinivas (1916–1999) was trained at the University of Bombay under G. S. Ghurye and later under A. R. Radcliffe Brown and E. E. Evans-Pritchard at Oxford University. He returned to India in 1951 and joined the Department of Sociology at Maharaja Sayajirao University, Baroda, where he overhauled the syllabus and trained students in fieldwork methods for sociocultural research. He was invited in 1959 to join the University of Delhi to head a new Department of Sociology at the Delhi School of Economics. The department became the premier department of sociology, recognized both nationally and internationally for giving a new direction to sociology and anthropology in India. Srinivas returned to his home state (Mysore) in 1972, where he first joined the Institute for Social and Economic Change as joint director and later, in 1979, the National Institute of Advanced Study, where he established a separate unit for sociological and anthropological research. He devoted as much energy to institution building as he did to his own research and writing.

Srinivas left a distinct mark on the practice of sociology and anthropology in India. The following sections consider his contributions with respect to (a) the anthropology of Hinduism, how to understand the unity and multiplicity of Hinduism; (b) the village community, the texture of relations and the functioning of caste hierarchy at the local level; (c) caste in historical and contemporary contexts (how was mobility made possible in the caste system, and what role did caste play in democratic politics?); and (d) studying one's own society, and its implication for the economy of knowledge.

Anthropology of Hinduism

Srinivas's classic study of religion among the Coorgs, a tiny distinctive group located in the Kodava district (previously known as Coorg) in South India, brought out the importance of purity and pollution as the fundamental opposition underlying Hinduism. He privileged rituals and everyday practices over belief for understanding Hinduism as a lived religion. Srinivas connected local forms of Hinduism with civilization-wide concepts by using the notion of "spread," arguing that some features of Hinduism could be found all across India while others were local and specific but could only be understood through the context provided by the all-India categories and concepts. Srinivas's conception of Hinduism had a major influence on Louis Dumont, who famously argued that the opposition of purity and pollution, rather than the distinction between the sacred and the profane, was the defining feature of Hinduism and that the religion of caste was primary while the religion of gods was secondary.

Village Community

On the basis of his study of Rampura, a village in Southern India, Srinivas proposed the concept of the *dominant caste*, which he defined as a caste that was numerically preponderant in a village, commanded economic and political power, and was not too low in the ritual hierarchy. Srinivas wanted to signal the importance of the peasant proprietor castes, who were lower than Brahmins in the ritual hierarchy but enjoyed considerable power over lower, previously untouchable castes, whose members supplied the necessary agricultural labor. Srinivas demonstrated the subtle relation between power, solidarity, and mutual interdependence across castes that gave texture to everyday relations in the village. He has been criticized for neglecting the forces of caste oppression endured by Dalits (the name used by the previously untouchable castes to refer to themselves) and for ignoring agrarian classes in favor of caste. Many scholars writing on Dalit history have argued through testimonial literature that patron-client relations did not offer protection to Dalits against the everyday forms of humiliation and exclusion that marked Dalit biographies. Arguably, there is a tendency to homogenize the past in these accounts and a commitment to modernist ideas that underplay the attachments that many Dalit castes had to their own village deities, to ritual roles that conferred power over occult forces, and to the performance genres in which they specialized. However, there is no question that the critiques offered by Dalit scholars have led to a reorientation in scholarly accounts of caste.

Caste in Historical and Contemporary Context

Srinivas made a sharp distinction between the "book view" and "field view" of Indian society, arguing that although the authoritative texts of the tradition presented a fourfold classification of caste in terms of a rigid hierarchical structure, social mobility for lower castes was in fact possible through a process he named as Sanskritization. Essentially, Sanskritization entailed the adoption of practices, such as vegetarianism or a ban on widow remarriage, that corresponded to prestigious Brahmanical values by lower castes to claim a higher status for themselves. It is interesting that Srinivas refused to consider these practices "Brahmanization"—the idea seems to have been that such castes do not imitate Brahmins but rather adopt practices that were considered more "refined" within a worldview in which Sanskrit had already made a break from being primarily a ritual language to expressing the aspirations of a cultural and literary elite. There is an interesting question as to who accorded the higher status to the castes that had successfully Sanskritized? Sometimes, Srinivas seemed to suggest that this acceptance was signaled by changes in the transactional economies of local societies; at other times, he suggested that these claims were presented to local kings and even to census commissioners, who were entrusted with the charge of recording caste status. Srinivas conceded that the path of Sanskritization for achieving upward mobility was not available to the untouchable castes, and he thought that greater opportunities were available to these castes through participation in electoral politics and Westernization, a process that diverged from Sanskritization.

Srinivas's decisive contribution to the understanding of democratic politics in India was to show the important role that caste-based mobilization played in electoral politics. Though he was initially ridiculed in the 1950s by Marxist scholars who thought that class had replaced caste in Indian politics, his understanding of grassroots politics turned out to be much more sound than that of armchair theorists. Research across the social sciences now vigorously engages the question of how electoral politics has enabled the lower castes to play a significant role in national and regional politics, while also being attentive to the changes in the nature of caste itself from a ritual entity to a political formation.

Importance of Studying One's Own Society

Srinivas theorized on the conceptual and methodological importance of studying one's own society long before the so-called reflexive turn in American anthropology. He propagated the view that there was no strict dividing line between sociology and anthropology that would correspond to the study of complex versus simple societies. Srinivas was acutely aware that his own position as a Brahmin opened some doors for him in his fieldwork but closed other opportunities of getting to know the castes that were considered polluting because of the tight surveillance exercised by the headman of the village over his movements. This persuaded him that greater diversity in the social

sciences was necessary because unless marginal groups themselves entered the knowledge institutions, their concerns could not be well represented by others. Srinivas's ambition for Indian sociology to be open to knowledge produced in metropolitan centers while maintaining a fierce autonomy of its own projects has been inherited by the following generations of Indian scholars and gives the discipline a distinct flavor in intellectual life in India.

Steward, Julian

Julian H. Steward (1902–1972), an American ethnologist, archaeologist, and theorist, developed a theoretical perspective termed *cultural ecology*, which he viewed as a scientific approach to the study of cultural change.

Life and Professional Career

Steward's strong identification with science and scientists began early in life. He was born in Washington, D.C., where his parents had met while working for the federal government. His mother's brief career as a federal employee in Washington ended with their marriage. His father, a lawyer by training, had a long career with the U.S. Patent Office. He eventually served as chief of the Board of Examiners, which reviewed applications for patents. This work required not only an understanding of patent law but also a grasp of the scientific basis of new technologies and other inventions for which patents were sought.

Steward's maternal uncle, trained in the science of meteorology, became chief of the U.S. Weather Bureau. Both he and Steward's father belonged to the Cosmos Club, a private club with an exclusively male membership; it included many government scientists and others from Washington's intellectual elite. The founder of the Cosmos Club, John Wesley Powell, was a geologist and anthropologist and was himself a high-ranking government scientist. He served as an early director of the U.S. Geological Survey and as the founding director of the Smithsonian Institution's Bureau of Ethnology, later known as the Bureau of American Ethnology (BAE). Steward would eventually join "the family business" of government science: in his case, as a federal employee of the BAE for about a decade.

Steward attended public schools in Washington until he was 16 years old. In 1918, along with the sons of several government scientists, he was recruited to attend a new and unusual college preparatory school in eastern California. He left the East for the West, and spent the next 3 years living at the school in Deep Springs Valley. Located in a remote corner of the desert north of Death Valley, the private boarding school was also a working ranch. Some 20 male students spent mornings in class and afternoons working outside on the ranch. They often assisted the hired ranch hands, some of them Paiute Indians from the surrounding area, whose immediate ancestors had been living as hunter-gatherers at the time of American conquest and settlement of their lands, just 50 years before Steward arrived in eastern California. Paiutes would figure in his earliest work as an anthropologist and in what became an enduring interest in hunter-gatherers.

During his years in Deep Springs Valley, Steward had other experiences that also influenced some of his later research and theoretical ideas. Unlike most men of his social class and urban origins in the East, he worked outdoors, and with his hands, on a daily basis. He spent half of each day using tools as he helped manage the ranch's irrigation system, make repairs to equipment, and take care of livestock.

Memories of his experiences at Deep Springs seem to have guided some of his later thinking about cultural ecology: specifically, about the links among natural resources, technology, the organization of work, and the size and structure of groups. Whether or not he ever understood the importance of those memories, he did come to see his 3 years at the school as *the* defining and transforming juncture in his life.

In 1921, Steward left Deep Springs and entered the University of California at Berkeley. During his freshman year, he happened to take an introductory course in anthropology jointly taught by Alfred L. Kroeber, Robert H. Lowie, and Edward W. Gifford. He had no further training in anthropology as an undergraduate student because in 1922 he transferred to Cornell University, where many of his classmates from Deep Springs had enrolled. The curriculum at Cornell, like many universities of the time, did not include anthropology. Steward earned a bachelor's degree in geology and zoology, and he considered a professional career in law, history, or a natural science. After seeking advice from Cornell's president, Livingston Farrand—who had trained in medicine but then turned to teaching anthropology at Columbia University—Steward finally decided on anthropology. He returned to Berkeley for graduate studies in 1925.

During the next 3 years, Steward studied with Kroeber, Lowie, and others, including the geographer Carl Sauer. In the summer of 1926, he undertook his first archaeological fieldwork, at sites along the Columbia River in Oregon. During the summers of 1927 and 1928, he completed his first ethnographic fieldwork, with Owens Valley Paiutes, who lived just 30 miles west of his old school in Deep Springs Valley.

His dissertation drew on library research, as was then common, rather than on fieldwork. In the fall of 1928, before completing his dissertation, he began to teach at the University of Michigan as an instructor. After earning a PhD in 1929, he resigned from the University of Michigan in 1930 to accept a position as an associate professor at the University of Utah, where his fiancée, Dorothy B. Nyswander, an educational psychologist, was one of the few women on the faculty. They had met 5 years earlier in Berkeley, while Nyswander was a student of the well-known psychologist and neo-behaviorist, Edward Chace Tolman. For 7 years, from 1925 until 1932, Nyswander—a rigorously trained experimental scientist and a committed behaviorist—was Steward's intellectual companion. The two shared some mutual interests in human behavior and why it changes, and they collaborated briefly in field research with Ute Indians.

The couple married in 1930 but separated 2 years later. In the interim, Steward worked primarily in archaeology, investigating a variety of sites in Utah. His active work in archaeology ended after just 3 years. In 1933, in the midst of the Great Depression, he resigned from the University of Utah and married a young woman named Jane Cannon, who belonged to a prominent Utah family. They spent the next year in Berkeley, California, where Steward located a series of temporary positions in teaching and research and his wife found steady employment as a secretary.

A year later, they left Berkeley for fieldwork in the Great Basin, a vast region of high desert stretching between the Sierra Nevada Mountains in California and the Wasatch Range of the Rocky Mountains in Utah. Steward knew a great deal in advance about the region because he had already spent nearly 7 years living in the Great Basin, first in eastern California at Deep Springs and then in Utah. For about 6 months in 1935, he pursued fieldwork with Paiute and Shoshone Indians in eastern California and in Nevada, interviewing elders. His questions centered on how they and their immediate ancestors had lived as hunter-gatherers before American conquest and settlement in the mid-19th century. In 1936, he spent several months in Idaho and Utah, completing his Great Basin research. It constituted the lengthiest and most significant fieldwork of his career.

Steward saw his fieldwork as a step in what he called his "twenty-year plan" for research: a plan that called for studying cultural change in a systematic and scientific way, starting with small societies of hunter-gatherers and then moving on to larger societies based on agriculture. In 1938, he traveled to Andean South America with his wife and their young son, planning to do fieldwork in Chile with Araucanian Indians. His family soon returned to the United States, and discouraged by illness and loneliness, he gave up on the project before reaching Chile. Two years later, he carried out brief field research on his own with Carrier Indians in western Canada.

Those 6 weeks with the Carrier people in 1940 marked the end of his active research on hunter-gatherers and of his fieldwork. He drew largely on

secondary sources—the research findings of archaeologists from sites in the Americas and elsewhere in the world—as he began to develop and refine his theoretical ideas about the causes of cultural change: specifically, the emergence over time of larger and more complex societies from hunter-gatherer antecedents.

In 1935, Steward had accepted a permanent position with the BAE as a research ethnologist. In 1939, he was appointed editor of the *Handbook of South American Indians* (1946–1959), a seven-volume work sponsored by the BAE and funded by Congress. Eleven years later, in 1946, he left Washington, D.C., and the BAE for a professorship in anthropology at Columbia University. He remained there for 6 years. Beginning in the late 1940s, while at Columbia, he undertook work for the federal government in the Indian Claims Commission trials. Steward served as an expert witness for the federal government but not for tribes seeking redress for the loss of their lands. Perhaps because of Steward's previous employment as a government scientist and his firm belief that science is value neutral, he readily agreed to serve as a witness for the federal government; but his role in the trials aroused enduring antagonism within anthropology, where he was widely viewed as having assisted the wrong side in the litigation.

During his years at Columbia, Steward worked with male graduate students who were World War II veterans, attending college on the G.I. Bill. Many were drawn to materialist perspectives, and they were influenced in various ways by Steward's theoretical approach. Some of them—notably Stanley Diamond, Morton Fried, Sidney W. Mintz, Robert F. Murphy, Elman R. Service, and Eric Wolf—went on to achieve prominence in academic anthropology. Another postwar student at Columbia, Marvin Harris, later promoted Steward's materialist and nomothetic approach—the attempt to formulate general laws—in an influential book, *The Rise of Anthropological Theory*. Steward largely avoided working with female graduate students.

In 1952, Steward moved to the University of Illinois, Urbana, where he spent 17 years—the longest portion of his career—before retiring in 1969. During those final years of his professional life, he published *Theory of Culture Change*, his best known work. He also oversaw a large-scale, collaborative project that he had initiated as the culmination of his ambitious 20-year plan—although it did not mark a highly successful end to it. Controversy surrounded the project, which centered on contemporary non-Western societies—mainly former colonies of Western powers—and the process of cultural change that some scholars of the time termed *modernization*. To Steward's dismay, when *Contemporary Change in Traditional Societies* finally reached print in 1967, the most outspoken critic was Eric Wolf, his former student at Columbia University.

Major Works and Contributions

Steward created a theoretical perspective that was distinctive in mid-20th-century anthropology. His environmental perspective on culture was unusual, as was his synthesis of comparative, secondary data from archaeological and ethnographic research. Both were essential to his goal of understanding the causes of cultural change by charting the course of change in the past. He did share a broadly historical orientation with archaeologists and many American cultural anthropologists of his time. But he departed sharply from the cultural historicism of Franz Boas and his American students, who included Steward's own teachers, Kroeber and Lowie.

Steward's theoretical perspective, in contrast to theirs, was materialist, environmentally oriented, generalizing, and concerned with causality. It was also thoroughly behaviorist. His theoretical ideas were the antithesis of humanistic and relativistic trends in cultural anthropology at the time. The work of Ruth Benedict—his colleague at Columbia University and a student of Boas—perhaps best represented those prevailing trends, which Steward always rejected.

Unlike Benedict, and in keeping with behaviorist principles, Steward consistently focused on what was external and observable. He gave priority to environmental resources, primarily those most important in human subsistence, such as edible plants, animals, and water; to technology, especially the tools used in procuring food and water; and to behavior, above all, subsistence-related work. These elements constituted what he eventually termed the *cultural core*, a key concept in his thinking about the causes of cultural change.

Another, earlier foundational concept was what he termed the *patrilineal band*. Steward developed this concept in an essay that he called his "first

theoretical work," a 1936 essay on types of bands (later divided into two essays and republished in *Theory of Culture Change*). He defined the patrilineal band as an exogamous and politically independent group of male kin who own land and defend exclusive rights to that territory. Patrilineal bands, he hypothesized, developed in arid regions and others where food resources were scattered and limited and where hunting centered on the pursuit of nonmigratory game animals. These were causal factors that limited the size of bands and kept population density low. Steward thought of this type of band as a particular *cultural type*, or *cross-cultural type* as he termed it. He argued that the patrilineal band occurred under certain ecological conditions, while different conditions produced—that is, caused—other types.

Steward drew his first evidence for the patrilineal band from published, but fragmentary, accounts of hunter-gatherers written by explorers, missionaries, and early anthropologists. He set out to find firsthand evidence through his own ethnographic fieldwork in the Great Basin in 1935 and 1936, but his search for the patrilineal band did not succeed. Steward found no evidence that hunter-gatherers in the Great Basin of western North America had formerly lived in patrilineal bands. In his 1938 ethnography, *Basin-Plateau Aboriginal Sociopolitical Groups*, he instead documented the diversity he had found. He focused on how environmental resources and conditions in different localities varied, how people in each place had adapted culturally, and how this resulted in differences in the size and structure of local groups. The concept of *cultural adaptation*, which Steward sometimes termed *cultural ecological adaptation*, provided a conceptual framework for the monograph. Over time, it became a unifying concept in American anthropology, spanning several subfields.

Steward's search for the patrilineal band also motivated his two subsequent efforts at fieldwork with hunter-gatherers: the failed effort in South America in 1938 and his final fieldwork with Carrier Indians in Canada in 1940. In Canada, as in the Great Basin, he found no evidence of patrilineal bands. He never succeeded in documenting this type of band structure in his own fieldwork.

During a 20-year period, between the mid-1930s and the mid-1950s, Steward wrote and published the series of articles that he later included in the collection titled *Theory of Culture Change*. One of the most important was "Cultural Causality and Law: A Trial Formulation of the Development of Early Civilizations," first published in 1949. Using secondary data from published archaeological reports, Steward argued that the earliest civilizations developed in arid and semiarid environments and shared a uniform sequence of development, including the use of irrigation in agriculture. As the telling title suggests, "Cultural Causality and Law" addressed one of Steward's central questions: What causes cultural change such as the independent development of civilization? A central premise came from the natural sciences. Steward believed that just as there are natural laws, discovered through scientific inquiry, so are there cultural laws that can likewise be discovered.

Steward came to call his approach cultural ecology, having used the terms *ecology* and *ecological* in print since the 1930s (e.g., "Ecological Aspects of Southwestern Society," first published in 1937 and later reprinted in *Theory of Culture Change*). In the early 1950s, he finally wrote an essay on the concept and method of cultural ecology; it appeared in print as a chapter in *Theory of Culture Change*. There, he explicitly named and defined the cultural core, a concept implicit in his previous writings about patrilineal bands, lineage- and clan-based societies, and early civilizations. A few years later, he quietly abandoned the concept of the cultural core—which was arguably the linchpin of cultural ecology—but he never questioned the concept of the patrilineal band, despite the lack of empirical evidence to support it. This foundational concept, inspired in part by experiences at Deep Springs, held deeply personal as well as intellectual meaning for him.

In the 1950s, Steward began to be linked with Leslie White as a fellow cultural evolutionist. White's brand of cultural evolution differed in many ways from Steward's ideas about the causes and the course of cultural change, and Steward adopted the term *multilinear evolution* to distinguish his approach from what he called White's *universal evolution*. Despite its name, the basic ideas of multilinear evolution came from cultural ecology. Steward consistently focused on environmental resources, technology, and the organization of work in analyzing cultural change. To analyze change in sociopolitical structures and complexity, a topic of perennial interest to him, he developed a concept he termed *levels*

of sociocultural integration. He included a chapter on that topic in *Theory of Culture Change*.

Steward always preferred the name *cultural ecology* for his approach, a set of ideas that he complained had been hard to "sell." That name proved to be the one that endured, and his theoretical ideas began gaining ground after the publication of *Theory of Culture Change*. Steward's environmental perspective helped stimulate a range of ecological approaches later in the 20th century, including human behavioral ecology, which has drawn adherents from biological anthropology, archaeology, and cultural anthropology. Cultural ecology's influence on three of the four subfields of American anthropology is undeniable but perhaps not widely appreciated.

Steward has become a figure of controversy among cultural anthropologists and Native scholars for his role in the Indian Claims Commission trials and the way in which he represented Great Basin Indians in his testimony and in his published writings; for his conviction that anthropology was a value-neutral science; and for his notable preoccupation with men's labor but his near silence about women's, despite having learned in fieldwork as early as 1935 that women had made the larger contribution to subsistence in much of the Great Basin.

Many archaeologists, among others, continue to find great heuristic value in Steward's cultural ecology. His founding role in environmental anthropology also continues to receive favorable attention. The Julian Steward Award, launched in 2002 and given periodically by the Anthropology and Environment Section of the American Anthropological Association, recognizes what is judged the best new book in ecological/environmental anthropology.

Strathern, Marilyn

Dame Anne Marilyn Strathern (1941–) is a British social anthropologist, Melanesianist, and an ethnographer of British society, kinship, reproductive technologies, and intellectual property.

In her 1994 William Wyse inaugural lecture, Marilyn Strathern brought center stage the question of the relations between anthropologists and those whom they study. Anthropology routes its knowledge through persons, she observed, gesturing to the specificity of the anthropological method of fieldwork. It would not be too much to say that Strathern's pioneering works on the social and cultural dimensions of a range of technological and ethical changes in our times have had a defining, that is routing, role in articulating the stakes of a number of current research projects across the humanities and social sciences. Strathern's take on analytical categories in ethnography famously tends

to dislocate them, introducing incommensurabilities of time, place, and size between tokens of the same socially current meaning. Her uneasiness with congealed explanations itself partly explains why Strathern has won esteem as one of the most innovative and respected anthropologists of the latter half of the 20th century.

Despite the fact that Strathern's original fieldsite was Melanesia, her intellectual projects equally excavate western Euro-American (i.e., her own) society. She recounts the inception of her interest in the classifications mediating between objects and meaning in her fascination with her father's cabinet of curiosities, a case of drawers holding various butterflies, stones, and minerals. As a schoolgirl at Bromley High School, she became interested in the archaeological ruins of lost civilizations. As a Girton College undergraduate in 1963, Strathern felt her curiosity taking a reflexive turn, away from the sheer phenomenality of the past and toward the problematic of research itself, insofar as research practices necessarily embed epistemological uncertainties and failures of resolution in specific institutional dilemmas. Rather than inquiring what objects might mean, Strathern came to ask, "What does it mean anthropologically to ask after them?" How do attributions of sense, and especially effects of size and scale, lie between cultures and the analytical procedures that reconstruct them? After finishing her doctoral work, Strathern became curator in the ethnographical section of Cambridge's Museum of Archaeology and Anthropology, and a ready theorist of her own practice. She later returned to Papua, family in tow, and after stints at the Australian National University and 9 years at Cambridge and in California, took up a chair in social anthropology at the University of Manchester in 1985. She subsequently held the William Wyse Professorship of Social Anthropology at Cambridge from 1993 to 2008.

Strathern's Papuan research concerns self-decoration, urbanization and migration, and decision making in both Hagen clans and their overlapping political organizations. In her later research in England, she examined questions of how the English middle classes understand traditional kinship patterns. Her writings also consider different perceptions of the relations between English towns and villages, of gender, of new procreative technologies, and of contemporary legal interventions in intellectual property and patents. Her work further analyzes how concepts of nature, biology, and genetics constitute contemporary understandings of personality and consumption. Always placing her subjects in cultural and social formations, such as the idea of professional accountability, her most recent writing has displayed a growing preoccupation with bioethics, a topic straddling disciplinary boundaries and especially amenable to interdisciplinary inspection.

Strathern's work is exceptionally innovative in terms of language, ethnography, methodology, and theory. Her inductive reasoning from observed phenomena is frequently counterintuitive, daring, subtle, and demanding. Her most imposing book, *The Gender of the Gift* (1988), offers a foundational account of Melanesian society, exploring how Melanesians represent their gender relations to themselves as fundamental to their sociality. In this work, as elsewhere, gender and feminist identification are not merely givens, or motivating principles for activist political projects, but also objects of serious theoretical investigation. Even while examining the different (and at times incommensurable) power dynamics between men and women, Strathern refuses to rehearse the themes of oppression and domination, preferring rather to understand gender as a multivalent categorization of persons, artifacts, things, events, and sequences. In Melanesia, for instance, a sense of male and female distinctiveness is secured through sexualized imagery. A person's gender identity is specified through his or her management of objects, especially tools, so that the question of gift exchange becomes connected to the form that domination (including patriarchal domination) takes in a certain society. Gender serves as an analytical concept and an aesthetic form, permitting the conceptualization of certain social exchanges, which, in turn, underwrite certain social conceptions and norms. This reconceptualization of gender throws down a challenge to fundamental assumptions in the social sciences. Strathern's implication is that little separates the presuppositions around gender of the Papuan Hagen people and the Western feminist anthropologists who study them. *The Gender of the Gift* is thus doubly admonitory. It first warns anthropologists against restricting their research to certain presumed features (gender, Melanesianness, and Englishness) and then insists on the historical, social, and situational specificities of the constructs they investigate, reminding

readers that these are constructs only. Constructs do things; they are just not already done things to be approached.

Another work, *Partial Connections* (1991), generally acclaimed as an anthropological classic, was received on publication as an equally daring, dauntingly complex text. The book is an experimental treatise on anthropology's epistemological frameworks, setting out with precision what we do when practicing the discipline or thinking of ourselves as its adherents. How does anthropology structure our representation and documentation of others? Reflecting on the premises of anthropology's means of collecting, segmenting, categorizing, and ordering its data, *Partial Connections* works with mainly Melanesian details to construct a nonregionally specific study of meaning making. Besides making use of her own fieldnotes and readings of others' theories, Strathern launches her disciplinary reflections by reading a selection of metaphors put forward by anthropologists as conceptualizations of their research. The Melanesian material is taken out of its context to serve not as *interpretatum* but as *interpretans*—that is, as an analytical tool—throwing into relief Euro-American practices of sense making. Anthropologists, for Strathern, always interpret others according to their own perspectives or prerogatives. "Native" concepts are thrown into relief by the logic of the Western thought that organizes, and then presents, them.

Strathern argues that the ways in which anthropologists organize material cannot then aspire to any kind of status as objective anthropological tools. Methodological themes and principles must remain constructs. Yet "constructs" or "constructed" is not opposed to "objective" or dealing with objects; rather, a measure of methodological self-consciousness sharpens a concern with the form and scale of the artifacts anthropologists use in symbolizing their field sites. In particular, anthropologists must beware of too easy an assumption of the commensurability of image-artifacts across explanatory contexts. A cautionary example for anthropologists of the commendably restrained use of explanatory induction in the use of objects is, for Strathern, provided in much of experimental natural science; and in *Partial Connections*, science becomes a constructive model for the analysis of Melanesians' techniques for understanding their own social forms.

Partial Connections is thus simultaneously the document of its own analysis and a palimpsest of postmodern attitudes in the production of what, somewhere, passes as knowledge. Positions that would be broadly accepted by most symbolic anthropologist and actor network theorists, for example, interpretive feminist readings in a plural frame or a postcolonial search for neo-Marxist explanatory totalities in censuring colonial ethnography (i.e., statistical practices of counting or measurement), are understood by Strathern only as variants in the field of constructs. These constructs are further taken ceaselessly to relate to, or articulate with, each other in producing complexity, diversity, and difference. The anthropologist gains her vantage on these complexities (i.e., Strathern's own), she argues, through changes of observation and perspective. While this could mean switching to a more "scientific" idiom, it could also mean seeking a purchase on contemporary society's distinctly managerial relationship to knowledge(s). This differs from noninstrumental anthropological knowledge, which, even if quantified, retains a certain suppositional character, as a kind of *controlled fiction*. Once again, little distinguishes the epistemological bases or validity of anthropological knowledge from the "knowledge" claimed by Melanesians in interpreting their culture. For *Partial Connections*, then, knowledge production is fictional, but these fictions can enable contestatory thought.

Some people find Strathern's writing complex and elliptical. The final effect, though, of her strategic, almost programmatic, emancipation of the language from the habitual terms of academic anthropological discourse is to spur the reader into thought. This is always enriching, if sometimes unsettling. For Strathern, field sites, professional-academic language, and modes of organizing data and even ethnographic descriptions all present themselves as aesthetic forms and potential analytical tools. The effect is to redirect attention both to the meaning of words, images, and acts (as interested symbolic anthropologists) and to their work—which she characteristically describes as what "they set in motion."

Strathern's thinking and writing keeps the relations between their descriptive and critical concepts in a constant state of flux. Her readers likewise find themselves unsettled by her problematization of the temporal dimension of anthropological writings, as she points out how often the authority of

ethnography is vested in its organizational time scheme, which lays down the writer's own analytical framework and projects the illusion of an "ethnographic present." Yet anthropological analysis evidently "happens" as much during conceptualization and writing up as in data collection. Strathern's insistence on the temporality of research, though, is more than just another version of the critique of ethnocentrism or a reflection on asymmetrical power relations between the studied and the student. In displacing the level of examination, Strathern repositions the anthropologist as bereft of any form of analytical authority other than an awareness of his or her own positionality and the position's resources. At the same time, Strathern's writing does not disavow her own status within the anthropological profession, further tending to make explicit the differences between social fractions. Her analysis of kinship, class, and cultural differences aims at their illumination, not at their dissolution.

Strathern's pioneer work in reframing anthropology so that its objects may include local professional cultures of accountability and professionalism has earned her membership in the British Academy of Science and the honor of damehood. She was awarded the Rivers Memorial Medal in 1976 and the Viking Fund Medal in 2003. Despite her insistence on the context and time frame in which the scholarly work was produced, her writings remain fresh, inspirational pieces of literature and are key texts in the philosophy of contemporary anthropology.

Strathern retired in June 2008 after 14 years of chairing the Department of Social Anthropology in Cambridge. She was also Mistress of Girton College. She still lives in Cambridge and is currently active in writing new studies of bioethics and transdisciplinarity in academic research.

Structural Functionalism

Structural functionalism is a theoretical approach in social anthropology whose origin is especially associated with A. R. Radcliffe-Brown (1881–1955). It was dominant during the first three quarters of the 20th century in British social anthropology and had offshoots in South Africa, the United States, Australia, and elsewhere. Its name reflects two key concepts, that of social structure and that of social function. The origin of these concepts lay ultimately in biological theory and more proximately in 19th-century social theory, and they are dominant in the forms of social explanation offered by structural functionalism. The approach also dominated sociology during the same period, associated particularly in the United States with Talcott Parsons and Robert Merton. Structural functionalism provided a guide both to the writing of ethnography and to explanation.

During the second quarter of the 20th century, social anthropology in Britain became dominated by two varieties of functionalism: (1) the version promulgated by Bronisław Malinowski, who taught at the London School of Economics, and (2) the structural functionalism of Radcliffe-Brown, who was professor of social anthropology at Oxford University from 1937 to 1946. In his theoretical writings, Malinowski tied the concept of function to a universal set of social "needs" (akin to the idea of functional requisites). These needs are met by institutions, which have in turn their own organizational "needs." In Radcliffe-Brown's version of functionalism, the function of an institution is the part it plays in the maintenance of the social system as a whole. The two functionalisms displaced evolutionism, the dominant paradigm in the later decades of the 19th century, and they effectively merged through the 20th century, although anthropologists trained by Malinowski were among those who challenged some of the precepts of structural functionalism. The approach drew particularly on the sociology of Émile Durkheim, but practitioners were also influenced by the sociology of Max Weber and other social theorists.

The rise of structural functionalism and Malinowskian functionalism coincided with the increasing emphasis in anthropology on long-term fieldwork conducted by professionally trained field-workers. A. W. Howitt and Baldwin Spencer had carried out field research in Australia in the late 19th century, when the evolutionist paradigm remained current, and the biologist and anthropologist A. C. Haddon and colleagues, including W. H. R. Rivers, conducted fieldwork in the Torres Straits Islands. The traditions of social anthropology, however, credit Malinowski with being the great innovator in introducing long-term intensive fieldwork in a single community in which the anthropologist is a "participant-observer," ideally working in the local language. Radcliffe-Brown's own fieldwork in the Andaman Islands (1906–1908) and Western Australia (1910–1912) was less significant, and his major contributions lay in synthesis, anthropological theory, and teaching. Radcliffe-Brown's American student W. Lloyd Warner published one of the first structural-functionalist monographs based on an extended period of fieldwork.

The Colonial Context

The data for evolutionist anthropology were reports (from many kinds of sources) of cultural "traits," which could be arranged in hypothetical evolutionary sequences. Social anthropologists inherited from the evolutionists a concern with "primitive" societies, even though they were embedded at the height of the structural-functionalist paradigm in the colonies and former colonies of European states. These societies tended to be treated as isolates and as functioning societies independent of any colonial context. The observational data of structural functionalism (and Malinowskian functionalism) led to holistic and "synchronic" accounts of social systems. Structural functionalism was thus ideally suited to intensive fieldwork in particular localities, and with the task of reporting or reconstructing "traditional" modes of life in what were then British colonies. In the United States and the settler colonies such as Canada and Australia, anthropologists studied the social lives and culture of the indigenous subjects of "internal" colonialism.

If social anthropology was not quite the handmaiden of colonialism, then it certainly sheltered in its shadow. The social lives and institutions of colonized peoples, categorized as "primitive," constituted the main subject matter of social anthropological research, which was largely made possible by colonial conditions. The relations between colonizer and colonized were at most a minor aspect of anthropological research and writing, however. The main aim was to construct comprehensive ethnographies of the social lives of relatively small-scale communities, as if they remained independent of colonial rule. "Bracketing" the wider political and economic context in this way had considerable advantages in the pursuit of the aim of describing and making sense of indigenous customs.

System, Structure, and Function

At the heart of structural functionalism is the idea of a social system, inherited from the sociology of Auguste Comte, Herbert Spencer, and Émile Durkheim. In an organic analogy made famous by Spencer and incorporated into structural-functionalist thought, the idea of a system is based on the idea of a body, in which each organ (such as the heart, lungs, and liver) performs a particular function

(or functions) in the maintenance of the life of the body as a whole. In an analogous way, structural functionalists saw the functioning of institutions such as government, law, and religion as contributing to the maintenance of the social system as a whole. In Durkheimian thought, system maintenance was conceptualized in terms of social cohesion or "solidarity." To maintain the idea of a society as a system, it needs to be treated conceptually as having definite boundaries.

The concept of function is intimately bound up with the concept of system, for the function of a part of a social system is its contribution to the maintenance of the whole. "Maintenance" in the social context meant the persistence of social integration and order. This kind of explanation became the dominant form of explanation in structural functionalism.

In describing a particular social structure, social anthropologists describe the *kinds* of social roles, social groups, and social practices that make up the whole. The idea of a structure of "social relations" remains a key concept in social anthropology. Social anthropologists writing within the structural-functionalist paradigm classified and described social units such as lineages, clans, tribes, age sets, castes, and so on; varieties of social roles, especially those based on kinship; and institutions including the economy, religion, law, and government.

The Jural Bias

Structural-functionalist anthropology conceived of social roles and relations as primarily jural in nature—as "bundles" of rights and duties. Concepts of social status, rights, and duties (as aspects of social structure) were adopted into social anthropology from 19th-century legal history, notably the work of Henry Maine, which provided an important source of many social anthropological analytical concepts. Descriptions of social structure and social relations often comprised descriptions of the norms governing conduct.

Subdisciplines

One of the strengths of structural functionalism was its pluralism. Social anthropology encompassed a wide field of subdisciplines, including political and legal anthropology, kinship, the anthropology of religion, and economic anthropology, against a background of intensive field research. The subfields were united in having social structure as a central concern.

Kinship in particular became a central topic in teaching and research. So-called primitive societies were conceived of as kin based, and were often characterized by features of the kinship system, as in the idea of "matrilineal societies," for example. Edited books such as Radcliffe-Brown's and Daryll Forde's *African Systems of Kinship and Marriage* (1950) brought together studies of the kinship systems of the societies of a region, the theoretical articles that discussed the nature of kinship and the varieties of systems. By the same token, social anthropologists treated political systems as subsystems, and they were subject to similar overviews, such as Meyer Fortes's and E. E. Evans-Pritchard's 1940 volume *African Political Systems*. Apart from religion as a subdiscipline, social anthropologists took "ritual" to be a distinct object of study, and many devoted monographs to particular rituals (e.g., Audrey Richards's *Chisungu*). Witchcraft and magic also formed a focus of study, and Evans-Pritchard's monograph on Azande witchcraft remains one of the best known monographs in social anthropology.

Regional Biases

Colonies and former colonies provided the main theaters for social anthropological research, introducing strong regional traditions in research. British anthropologists focused strongly on Africa and the Indian subcontinent, while anthropologists in the United States concentrated on Native American societies from the perspective of structural functionalism—in the work of Fred Eggan, for example. Similarly, social anthropology in Australia, initially under Radcliffe-Brown's tutelage, was concerned predominantly with indigenous studies, as well as research in Melanesia and Oceania. The latter region also provided the main theater for anthropologists living and working in New Zealand. In the later phase of structural functionalism, there developed an anthropology of "complex" societies, mainly studies of rural regions in, for example, Britain and Europe.

Relation to Structuralism

Lévi-Strauss cited ethnographic writings of the broad functionalist tradition in his overviews of kinship, myth, and totemism. Functionalist

anthropologists in turn incorporated structuralist ideas into their own analyses. The main channel for structuralism in Britain was through Edmund Leach (who had studied under Malinowski); in Australia, Kenneth Maddock played this role, while W. E. H. Stanner devised his own version of structuralist analysis of Australian Aboriginal myth and ritual. Pierre Maranda among others imported structuralism into North American anthropology.

Approaches to Explanation

As mentioned, one mode of explanation in structural functionalism was in terms of function—a practice or institution was "explained" as contributing to the maintenance of the system or structure as a whole. More sophisticated versions of this mode of explanation posited some kind of mechanism, as in Émile Durkheim's theory of the effects of totemic "force" in his *Elementary Forms of the Religious Life*, which provided a model for anthropological explanation. Victor Turner, for example, argued that Ndembu religious symbols served as a mechanism that reinforced the norms underlying matrilineal kinship relations.

In a second mode, features such as the forms of religious beliefs (the explanandum), were explained in terms of forms of social structures (the explanans). In this way, E. E. Evans-Pritchard explained the shape of Nuer beliefs about *kwoth* ("spirit") as "refractions" of the social structure. Mary Douglas elaborated this approach by looking for correlations between forms of belief and forms of social structure, while Ioan Lewis's approach to religious action was more pragmatic—actors shaped beliefs as instruments for political action. Comparative studies, in which two or more cases about the same topic but from different regions were compared, provided a common method for exploring hypotheses about the factors underlying or explaining social phenomena.

Some structural-functionalist research transcended the tendency to treat communities as small social isolates. Studies of plural societies by Leo Kuper and M. G. Smith, for example, encompassed relations between the dominant society and an indigenous sector. An aspect of structural functionalism that has now been all but forgotten is the attempts at formalism by some of its practitioners. Edmund Leach, for example, adopted some Lévi-Straussian structuralist ideas in his quasi-mathematical models of social structural variables. S. F. Nadel and M. G. Smith attempted formal representations of social roles and of processes of social change in the structures of roles, respectively.

Scientism

The system concept in structural functionalism was associated with scientism or "naturalism"—the view that social anthropology is a "natural science of society," in Radcliffe-Brown's phrase. The two main stages in this enterprise were supposed to be the classification of features of society and of social systems—types of kinship and political systems, and so on—and the search for social "laws." Naturalism was by no means universally accepted within the discipline. Evans-Pritchard famously expressed an opposing view (having earlier accepted Radcliffe-Brown's position), arguing that social anthropology was a humanist discipline in search of significant patterns rather than social laws.

Need for a Special Theory of Social Change

A difficulty with a systems approach to human social life lies in representing social processes and explaining social transformations. There is a tendency to represent social systems as static or tending to homeostasis. Because structural functionalism took social systems to be isolates (at least for the purposes of analysis), and because of the assumption of a self-reproducing social system, social change needed to be a distinct topic rather than being incorporated into the very idea of society as in structural-Marxism and practice theory. Nevertheless, some analyses incorporated processes of both short- and medium-term social change. Edmund Leach posited that Kachin villages oscillated between two modes of polity: relatively hierarchical, based on neighboring Shan societies, and relatively egalitarian. Victor Turner made intensive studies of social processes and village dynamics among Ndembu people of what is now Zambia, described in what he called "social dramas." In the context of nonliterate societies, the construction of long-term history was eschewed as "speculative" in early structural functionalism, although a school of anthropological history later developed within the paradigm.

Revisions to Structural Functionalism

Structural-functional anthropology was never uniform, of course, but through the mid-20th century into the third quarter, stronger divisions developed. Most prominent was the "Manchester school" of anthropology, under the guidance of Max Gluckman at Manchester University. Gluckman's own brand of anthropology emphasized conflict and division, but interpreted in functionalist mode as ultimately contributing to social cohesion. Social process was a dominant theme in the school, notably in the ethnographic analyses of Victor Turner, mentioned above, and this emphasis shifted to social transactions in the 1970s. The Malinowskian tradition also contributed to a broader palette of analytical concepts. Raymond Firth, who had been Malinowski's doctoral student, complemented the concept of social structure with the idea of "social organization," denoting the processual component of social life. This conceptual distinction foreshadowed some aspects of structuration theory. The study of language has never been a strong component in British social anthropology, but there were some moves toward a linguistically informed anthropology in the work of Edwin Ardener at Oxford University, and there have been short-lived attempts to found a "semantic anthropology."

Paradigm Shift

The broad political context of the practice of social anthropology changed profoundly in the decades following World War II, with the accelerating rate of independence for former colonies. While giving the appearance of radical difference, the structural Marxism derived from the writings of Louis Althusser was sufficiently similar to structural functionalism to be readily incorporated into social anthropology by younger scholars, and it suited the radicalism following the protests against the Vietnam War in the late 1960s. The idea of a social system was modified to distinguish between the economic base and the superstructure, with explanatory priority being given to the base rather than to social structure as a whole. Scholars such as Maurice Godelier wrestled with reconciling these categories with the concept of institution and with the meaning of economic determinism. One of neo-Marxism's more productive offshoots was the theory of internal colonialism, applied to race relations in southern Africa and in settler colonies such as Australia.

The development of feminist anthropology and gender studies within social anthropology also began in the 1970s, and it radically challenged the male bias of structural-functional and cultural anthropology, in terms of both the predominant gender of the researchers and the reports skewed toward male perspectives. In the writings of Marilyn Strathern, this stream was to question many of the ontological assumptions of social anthropology and its approach to translation. At the level of "grand theory," younger anthropologists were increasingly influenced during the 1980s by the "practice theory" of Pierre Bourdieu and the structuration theory of Anthony Giddens. These theories sought to radically modify the concepts of social system and social structure to incorporate individual agency into the models, and an inherent tendency to social transformation. The poststructuralism of Michel Foucault would also have a profound influence on younger anthropologists.

Attitudes both to field research and to the writing of ethnography changed as well. Postcolonial critiques of the 1970s had depicted anthropology as the "handmaiden" of colonialism. The later postmodern critiques challenged the objectivist stance of structural-functionalist and cultural anthropological ethnography and the scientific gaze of the field-worker. So too have the kinds of cultures and societies that anthropologists study changed. First, communities in the former colonies underwent radical social and economic change through the 20th century, which anthropologists have been at pains to record. Second, to an increasing degree, social anthropologists have studied communities within Western industrial societies, so that there is now a thriving community of researchers into the societies of Europe.

The Legacy of Structural Functionalism

Structural functionalism was an outstandingly successful paradigm in social science. Approaches to explanation regularly change, however, rendering earlier theoretical writings essentially obsolete. The main legacy of structural-functionalist anthropology, therefore, is a vast body of ethnography of societies of many parts of the world. Nevertheless, there is a strong continuity between the anthropology of the structural-functionalist era and today's eclectic fields of social and cultural anthropology, namely

the emphasis on ethnography, which, in the view of many, is not merely a method but remains at the heart of anthropology as its main concern.

Structural Marxism

The expression "structural Marxism" is a paradoxical one in several senses. Its emergence reflected an intellectual fashion—structuralism—an identification denied by many of those to whom it was attributed. Furthermore, it is closely associated with a notion of "Western Marxism," viewed as a departure from the Soviet orthodoxy of the time (post–World War II), yet one of its major theoreticians, Louis Althusser, remained a member of the Communist Party. A further paradox was the association of an explicit scientism—Althusser's "structuralism"—and, by most reckonings, the undeniable historicism of Marx, young or mature.

In anthropology, structural Marxism represented the convergence of two tendencies. One of these was the demand that anthropology include within its analytical framework the recognition of the fact that research took place within a historical and geopolitical landscape rather than being merely the technical study of "societies out of history." This demand for the relevance of anthropological study not just to researchers, but to their subjects—and their shared conditions of existence—was framed in disciplinary terms by two edited collections in particular (Dell Hymes, 1974, and Talal Asad, 1973). The other tendency was represented in the rising explanatory value of an economic anthropology that focused on the ways in which noncapitalist forms of economy (increasingly conceptualized as modes of production) were articulated with capitalism (and, in overlapping formulation, within the capitalist world economy). The idiom of the substantivist/formalist debate was substantially revised by a discussion of value invigorated by the attention paid to Marx's *Capital* and to elaborations of the labor theory of value and the concept of "reproduction" in and of the relations of reproduction.

The structuralist underpinnings of structural Marxism reflect as much a vogue for a unified social science as they do a widely shared theoretical model. In the work of Althusser and Nicos Poulantzas, for example, what was substantively shared with other structuralism-associated scholars of the time (Claude Lévi-Strauss, Michel Foucault, and Roland Barthes) is often hard to discern. Although Althusser was celebrated as the cardinal theoretician, his structuralism referred more to his assertion that the "mature" Marx's break with his younger, Hegelian self produced a scientific (structural) Marxism (for an acerbic critique, see Kolokowski, 1971).

While there is no question about the galvanizing impact of the structural-Marxist synthesis in terms of a model-building-within-history outlook, the unity of the project declined as the differences among those grouped under the label became more apparent (a process itself complicated by the time lag of translation from French to English, and hence the dissemination of stances already abandoned or modified by the primary authors, as in the case of Foucault). Lévi-Strauss, a prominent candidate for supreme structuralist, was, following harsh critique from Sartre, little concerned with reconciling Marxism and structuralism. While Althusser's theoretical prominence was enhanced by the reputations of his many distinguished students and colleagues including Poulantzas, his personal fall from grace following psychiatric hospitalization for having killed his wife during a bout of mental illness overshadowed much of his scholarly legacy.

While the U.K. and, to a lesser degree, the U.S. anthropology's connection with structural Marxism was largely inspired by the work of French anthropologists working within a Marxist tradition, differences in the scale and institutional composition of the two national anthropologies influenced impact and reception. In the United Kingdom, the smaller scale of the academic community and the fact that New Left Marxism was more evident in the academy than in mass politics may partially account for the fact that structural Marxism seemed better defined there. Additionally, the impact of the Birmingham school's cultural studies provided a more generic social science footing. This critical mass may account for the intensity of (to some, arcane) theoretical output (see, e.g., Hindess & Hirst, 1975).

Structuralism's importation to U.S. anthropology was much more skeptically received than was the case in the United Kingdom; the association with Marxism would hardly have been an enhancement, and the already established tradition of anthropological Marxism rooted in a materialist-evolutionist tradition was similarly resistant to the French version (although Marshall Sahlins, notably, was less resistant).

In the broader setting of academe, the massive expansion of higher education in the United States (and elsewhere, though more modestly) made possible the oddly twinned hypervalorization of science and the tendency in the humanities and social sciences toward highly abstract theorizing. In anthropology, the relative impact of the structuralist and the Marxist elements oscillated, but Marxism was soon overwhelmed by the mutation of structuralism into poststructuralism. Additionally, the analytic strength of structural Marxism was based in studies on the periphery, far from the hyperactive metropolis, and within very specific national versions of the colonial apparatus. By comparison with the "theoretical" ferment in the core, structural Marxism in the anthropological study on and of the periphery was quite restrained, directed most to the area of economic anthropology and to those tendencies of a markedly materialist and substantivist character. While dependency theory shared with structural Marxism a closely related theoretical framework, it was more situated within the anthropo-colonial framework of Latin America, while structural Marxism had a strong but nonexclusive Africanist orientation, a feature that likely enhanced its association with social anthropology and work based in the former French colonies. Among the earliest widely known anthropological work that fed into the emergent structural-Marxist literature was Emmanuel Terray's *Marxism and "Primitive" Societies* (1972), which was influential not only because of its substantive contribution but also because of its rapid translation (first published in French in 1969). The revival of interest in the concept of mode of production was no doubt spurred by the English-language publication of the *Grundrisse* (translated and with a foreword by Martin Nicolaus), and in the context of Africanist anthropology of the time, field-based elaborations of the concept of the *articulation of modes of production* gained enormous theoretical prominence, and a so-called lineage mode of production encapsulated the structural-Marxist configuration. The work of Claude Meillassoux (1975) was particularly important in consolidating a revived economic anthropology of the era. The Africanist focus in his exploration of the dynamic relationship between capitalism and precapitalist forms was enhanced with the publication, in 1980, of *The Articulation of Modes of Production*, edited by Harold Wolpe. Pierre-Philip Rey (with limited exposure via publication in English) is another notable contributor of that era, as is Maurice Godelier (albeit not in an Africanist context).

In the United Kingdom, a collection edited by Maurice Bloch included contributions less focused on the specific changes to the subfield of economic anthropology, although that was directly relevant, than to the broader implications for anthropology of a rigorous application of the "mature" Marx. It is noteworthy that all the contributors (apart from the late Raymond Firth, whose presence in the volume was in part to provide a disciplinary validation) continue to be affiliated with a critical anthropology significantly consolidated during this period.

A major literature review and analysis ("Marxist Approaches in Anthropology") by Bridgett O'Laughlin in 1975 offered a trenchant critique, mainly from a social anthropological perspective. A decade later, William Roseberry provided an overview in the same series (*Annual Review of Anthropology*), the title of which, "Political Economy," indicated, if only nominally, a degree of domestication of some of the more abstract theorizing that had emerged in the 1970s. Barry Hindess and Paul Hirst's *Pre-Capitalist Modes of Production* was the centerpiece of intense discussion that wrested much analytic work away from fieldwork-based material and into domains of high rhetoric. By comparison, debates conscious of the discipline's limits and ambitions were less concerned with scoring Marxiological points than in generating a broader scheme of understanding that reflected the political realities of ex-colonial and peripheral social formations for which questions of articulation had more than just academic agendas. The collection by Kahn and Josep Lloberra, *The Anthropology of Pre-Capitalist Societies*, published in 1981, was a major stocktaking and revealed the divergence between structural Marxism and Marxist anthropology as adequate labels for work to date.

The very pronounced French influence on the structuralist-Marxist synthesis, as configured by the contemporaneous impacts of Lévi-Strauss, Althusser, Poulantzas, and others, appeared to offer the opportunity in anthropology to reproduce, in general terms, a holistic approach in which idealism and materialism were complementary rather than mutually intolerable. However, the idealism of Lévi-Straussian structuralism had little staying power once marshaled in the name of historical-materialist analysis. In light of what came to be published (and mainly in the form of article collections rather than monographs [see, e.g., Seddon, 1978]) under the nominal heading of structural Marxism, it was difficult to see more than a formal acknowledgment of notions of system and structure that had come to be associated with structuralist scientism. Lévi-Strauss's project may have been set out with appropriate nods toward cybernetic systems theory, modern linguistics, cognitive theory, and computing, but they were idiosyncratic formulations that few others could realize. The term *structural Marxism* came to stand as much, if not more, for a nondogmatic Marxism as for a viable synthesis, and the movement of structuralism as part of the literary turn in anthropology (consolidating the explicit antiscience associated with Clifford Geertz) as well as in an expansionary poststructuralism indicated fundamental, and perhaps fatal, incompatibilities with the originally proposed, historical-materialist synthesis.

STRUCTURALISM

Anthropological structuralism developed from linguistic structuralism. However, despite some similarities, and despite the anthropological version's claim to linguistic ancestry, the two were quite different. In fact, the claim to ancestry depended on a misreading of Saussurean linguistics. The past tense is by way of indicating that the anthropological version is now largely defunct, while the linguistic version still lives. At the same time, it is important to note that the influence of linguistic structuralism within anthropology predated anthropological structuralism and still continues; this continuing influence is conceptual, methodological, and theoretic, and it spans a number of anthropological schools.

Linguistic Structuralism

The idea of structuralism came from the phonological structures identified by the Franco-Swiss linguist Ferdinand de Saussure (1857–1913). Saussure is commonly seen as the founder of modern synchronic (and descriptive) linguistics, but others such as Franz Boas in the United States and Bronisław Malinowski in Great Britain share that honor. Saussure's unique contribution concerned the specific nature of those synchronic systems.

Saussure

Linguistic structuralism began with Ferdinand de Saussure's explicit realization that the sound units of a language varied according to the system of that language, and that the sound values were not absolute but were relative to other sounds in the system. The sound units came, shortly after Saussure's work, to be called *phonemes*. He distinguished paradigmatic oppositions among entities (whether sounds, words, or other) from their syntagmatic relations of co-occurrence. The sound system of a given language was organized as a system of oppositions (or contrasts) based on attributes such as voicing (versus not), the articulator (tongue, lips, etc.), the point of articulation (lips, alveolar ridge, velum, etc.), and the nature of articulation (stop, fricative, sonorant, etc.). Syntagmatic structures (or rules) specified for a given language how phonemes could be strung together to make signifiers and how different signs could be strung together to make larger speech units (syntax). Saussure himself was a historical linguist interested in diachronic change. His key insight was that diachronic change was not to be understood—as it previously had been seen—as a matter of changes in individual items or features but instead as changes in a synchronically functioning system. In his view, synchronic linguistics was not opposed to diachronic linguistics but was an essential contributor to diachronic understanding.

Saussure described a semiological science of "signs" and "symbols." Signs were meaningful entities formed from the combination of a "signifier" (mental sound image) and a "signified" (concept); the combination was arbitrary in the sense that there was no intrinsic nonsocial motivation for it, whereas for symbols (e.g., a drawing for what it represented, or smoke for fire), the combination was motivated. He saw language as a system of signs wherein the arbitrariness enabled the differentiation of languages from one another. He distinguished the system of language (*langue*) from its observed realizations in speech (*parole*). *Langue* was a collective mental structure that was passively received from a speech community; *parole* was physically present and actively created by individuals. The collective mental structure only existed in the individually held representations of it that speakers inferred from their interaction with members of the relevant speech community; language was thus a Durkheimian "collective representation."

Saussure's discussion was only programmatic, though based on his brilliant and pathbreaking analysis of the Indo-European vowel system. Major advances in understanding the systemic role and psychological nature of the phoneme were made by Edward Sapir (a student of Boas). The definitive development of the Saussurean structuralist approach to phonology came in Nikolai Trubetzkoy's *Principles of Phonology*. Trubetzkoy clarified how regularities in phonological systems (i.e., their structures) were shaped by the interaction of the substance of articulatory systems with the functional role of phonemes within a speech community's varied voices (i.e., they distinguish Saussurean "signs" from one another).

Prague: Trubetzkoy

The Prague school founded by Trubetzkoy (1890–1938) and Roman Jakobson (1896–1982) provided one major elaboration of the Saussurean

paradigm. It emphasized phonological substance (and, later, other kinds of linguistic substance); in it, Trubetzkoy's phonological insights were applied more widely to language in general. These insights notably included the conceptualization of "marked" versus "unmarked" categories; marking theory has subsequently been considerably extended by Joseph H. Greenberg. Prague's focus was on the application of rigorous analytic systems to known languages.

Yale: Bloomfield

The other major elaboration was in the Yale (or American) school of Leonard Bloomfield (1887–1939), who, though he was not his student, was much influenced by Boas. Bloomfield's approach, in response to the great number of undescribed, unanalyzed, and dying Native American languages at the time, had a descriptive and inductive focus, and it has often been spoken of as "descriptive linguistics." Bloomfield's approach began with basic raw phonetic entities (phone types), which were grouped by the analyst of a particular language into the phonemes of that language and then analytically organized as the phonological system or structure of that language; the phone types that belonged to a given phoneme were the allophones of that phoneme. Bloomfield laid out a systematic extension of his phonological approach to the structure and semantic content of other linguistic forms including morphology and syntax. This approach was based on raw etic (i.e., observed and defined outside the given system) entities grouped as allo-units into emic (defined and meaningful within the system) entities (e.g., morphemes, sememes, tagmemes, etc.) of the given language. Several of Bloomfield's students attempted to elaborate and fill in his larger structure, but it has since seemed to most observers that the quantitative, functional, and qualitative differences among phonology, morphology, lexicon, syntax, and so forth made such strict analytic parallels inappropriate and often misleading.

In an attempt to keep linguistics clearly scientific, Bloomfield opted to ground his later presentation in the regnant psychology of the day, behaviorism (whereas he had earlier offered a totally nonbehaviorist approach to the same analytic process). Many of his students joined in this tack. This grounding turned out to be a bad move for several reasons. First, behaviorism came rapidly to be discredited in psychology. Second, there was nothing intrinsically behaviorist in Bloomfield's linguistics, and so there was no intrinsic necessity for it to have shared in behaviorism's discrediting. Third, the strongly inductivist pragmatic behaviorist approach of Bloomfield's students got them into complex and unnecessary analytic culs-de-sac.

Among Bloomfield's major students were Charles Hockett, Kenneth Pike and Eugene Nida (who developed an extended version of Bloomfield's approach, tagmemics, which is much used for the recording and basic analysis of previously undescribed languages), Martin Joos, and Zellig Harris.

More Recent Developments

Harris was Noam Chomsky's teacher and provides a clear bridge from Bloomfieldian syntax to Chomsky's transformational-generative grammar. However, at the same time, Chomsky distanced his linguistics from the descriptive emphasis of the Bloomfieldians—toward something more like the analytic thrust of Prague—and he strongly rejected the Bloomfieldian grounding in behaviorist psychology in favor of a deductive approach rooted in a kind of Cartesian innatism. Consonant with these shifts, Chomsky tried to move American linguistics from its traditional comparative affinities with anthropology—which went back to Boas—toward a combination of philosophic bases with psychological concomitants.

While Bloomfieldian structural/descriptive linguistics has lost its dominant role in American linguistics, it remains important in a number of ways:

- Especially in its tagmemics form, developed by Pike and Nida, structural/descriptive remains the preferred approach for descriptive linguistics—that is, for the description and basic analysis of previously undescribed languages. Its methodology has had a lasting influence on anthropological field methods, especially those aimed at describing, explicating, and understanding cultural conceptual systems, as in ethnoscience and cognitive anthropology.
- Bloomfieldian sociolinguistics remain anthropologically important.
- Prague phonology, in one or another guise, remains the dominant phonological approach.

- Saussure's conception of language as a system of "signs" has continued modern relevance because of its focus on meaning and its emphasis on the collective, mental, and passively received (i.e., codelike) nature of language, as distinct from speech. In its focus on "signs" as the union of the signifier and the signified, it foregrounds linguistic meaning (i.e., semantics), where most subsequent linguistics has focused on the structure of systems of signifiers.

Anthropological Structuralism

The founder of anthropological structuralism was the French anthropologist Claude Lévi-Strauss, and major subsequent anthropological participants were the English anthropologists Edmund Leach and Rodney Needham.

Lévi-Strauss

Lévi-Strauss (1908–2009) started his career studying kinship in ways that echoed Durkheim while focusing on more specific anthropological data—particularly marriage patterns with some attention to kin terminologies. Some of the structural aspects of the British structural-functional approach showed up in both the focus and the content of this work, since that school had been much influenced by Durkheim (while the First World War had largely killed off his direct French academic descendents). But, unlike the British approaches that typically emphasized actual relations in actual systems, Lévi-Strauss's kinship analysis emphasized the systemic implications of whatever pattern some given combination of unit definitions and marriage rules would produce; his models thus were more abstract and ideal.

In 1941–1942 (the last year of Boas's life), during World War II, Lévi-Strauss and Roman Jakobson, in New York as escapees from Nazi Europe, had a series of meetings with Franz Boas. These meetings exposed Lévi-Strauss to Jakobson's variant of linguistic structuralism and to several aspects of Boas's work, including, significantly, his sense of the importance of linguistics for anthropology, his interest in both mythology and physical culture, and his approach to the analysis of conceptual systems. Boas, while a founder of American descriptive linguistics, was not a structural linguist. Boas's approach to the analysis of conceptual systems became—in Lévi-Strauss's hands—the structural analysis of myth, and indeed, it is Boas's study of Alaskan needle cases that can be taken as an illustration of the Lévi-Straussian approach to the analysis of conceptual entities. Lévi-Strauss's work abruptly changed after his encounter with Boas and Jakobson. His focus shifted to the structural analysis of systems of myth (a topic taken from Boas) and to a theoretical focus on structure (as he had come to understand it from Jakobson). His analyses of myth were based on patterns of analogous oppositions and on the kinds of equivalences that emerged from similarities in oppositional relations. The analytic point was often to use successively narrowed equivalence patterns to transform apparently irreconcilable oppositions into bridgeable ones. He credited his structuralism to the founder of linguistic structuralism, Ferdinand de Saussure, but there is no evidence that he ever read Saussure's *Course in General Linguistics* with any care; rather, his understanding seems to have come from Jakobson's loose attempts to generalize the Trubetzkoyian version of Saussure's approach. The richness of Lévi-Strauss's material, the breadth of his purview, and the issues of content and diffusion that he raised were breathtaking, but his tours de force were never duplicated. In spite of the excitement he generated and the new vistas he opened, Lévi-Strauss left behind no method that anyone else seemed capable of using in any way that resonated with the anthropological community, and so his actual analyses of myth never led to new understandings of the target cultures or to usable new insights into the functioning of myth.

Boas never had a particular theoretical school associated with him. His contributions spanned anthropology's traditional four fields (cultural anthropology, linguistics, archaeology, and physical anthropology), and our modern understanding of how the four fit with one another comes directly from his contributions as does our related substantive understanding of how human biology, language, and culture do and do not relate to one another. His was a broad conception of anthropology and one that influenced Lévi-Strauss.

Additionally, Lévi-Strauss was influenced by Boas in another very different but very important way. It was Boas who institutionalized anthropology in the American academic system. There had been anthropologists in the United States before him, but there were no departments of anthropology. Boas had

started by creating such a department at Columbia University, and then his students (e.g., Alfred Kroeber, Robert Lowie, Edward Sapir, Alexander Goldenweiser, Leslie Spier, Melville Herskovits, Paul Radin, Ruth Benedict, Margaret Mead, and many others) created departments at other major universities (e.g., the University of California at Berkeley, University of Pennsylvania, University of Chicago, and Northwestern University). After the war, Lévi-Strauss returned to France with the aim of accomplishing a similar institutionalization. The very different structure of French academic institutions and their interrelations necessitated a different plan; ties of French universities to the fixed curricula of the Lycée system precluded basing the discipline in departments focused on undergraduate education as had been the U.S. pattern. Instead, Lévi-Strauss moved to institutionalize the discipline within the French research establishment, through the vehicle of the Laboratoire d'anthropologie sociale. Lévi-Strauss used his status within the Left Bank intellectual scene (as the "savant" who came after Jean-Paul Sartre) to leverage the recognition of the discipline and of its importance. And, interestingly, as that goal came to be accomplished, he gradually withdrew from the savant scene.

Leach and Needham

Edmund Leach (1910–1989) and Rodney Needham (1923–2006) described themselves as followers of Lévi-Strauss, but in each case they seemed to use aspects of his approach more as a basis for fighting their own battles within the British anthropological establishment than to pursue or elaborate Lévi-Strauss's agenda. In part, they aimed at broadening social anthropology to include more of culture, though with a more structurally oriented kind of analytic emphasis than one saw in American cultural anthropology.

Needham developed what he saw as an application and explication of Lévi-Strauss's work on marriage systems to embark on new analytic generalizations. But his analyses remained rooted in the substance of particular systems in a way that Lévi-Strauss's never were. A key distinction for him was prescriptive versus preferential marriage systems—which he assimilated to Lévi-Strauss's elementary versus complex systems. The trouble was that—as Floyd Lounsbury's review (in the *American Anthropologist*) of Needham's *Structure and Sentiment* made clear—his definitional standards were intuitive and inconsistent. Both the (claimed) empirical groundedness and the inconsistency were antithetical to Lévi-Strauss's approach, and so, especially in light of Lounsbury's review, Lévi-Strauss very publicly distanced himself from Needham's version, which in turn led Needham to withdraw his allegiance to Lévi-Strauss.

Leach rooted his work in Lévi-Strauss's study of mythological and symbolic systems. Where Lévi-Strauss depended on finding patterned regularities across a wide corpus of examples and used that recurrence as evidence for the empirical reality of his analytic claims, Leach focused on particular cases and relied much more on his own intuitive or critical reading to identify key elements and relations. Leach's narrower data purview did allow him to be more careful and rigorous in his actual analytic arguments. Those of Leach's analyses that were Lévi-Straussian were often careful and explicit enough in their claims to allow independent evaluation; the problem was that, while always stimulating and thought provoking, their actual conclusions too often turned out to be in error. For example, Frederick C. Gamst showed in 1975 that Leach's analysis of traffic light colors doesn't hold up; John Halverson in 1976, similarly undermined Leach's exciting and creative analysis of animal categories and terms of abuse; and Michael Carroll in 1977 did something similar regarding Leach's analysis of the biblical Genesis story.

Subaltern Studies

A school of critical scholarship developed in India beginning in the early 1980s, subaltern studies initially focused on a broad critique of the dominant historical narratives of the colonial and postcolonial era. Key to the critique is the recognition that the dominant narratives of both colonialist and nationalist historical writing fail to acknowledge the innumerable ways in which vast numbers of socially and politically marginalized people—peasants and urban poor primarily, but also indigenous people, women, and subordinated caste groups, among others—resisted and articulated forms of politics distinct from, and sometimes at odds with, those associated with the nationalist elites. Led by the historian Ranajit Guha, the original core collective included scholars who have gone on to become major figures in postcolonial studies. Partha Chatterjee, Shahid Amin, David Arnold, Gyanendra Pandey, David Hardiman, Dipesh Chakrabarty, and Gayatri Spivak are some of the prominent intellectuals associated with the early phase of subaltern studies.

The term *subaltern* itself is associated with the Italian Marxist Antonio Gramsci, and it refers to an individual in a position of social subordination to hegemonic power. Gramsci used the term interchangeably with at least two other terms that taken together convey the nuanced sense that subaltern studies seeks to capture within its scope. *Subaltern* refers to nonhegemonic groups being "subordinated" but also "instrumental" within the scheme of power. In other words, marginalization is as much about exclusion as it is about the lack of autonomy of action. This dual facet of subordination characterizes subaltern groups as being unwitting participants in their own subordination—marginalized by their own consent.

Subaltern studies radically shifted the focus of investigation and analysis and had powerful implications for historiography, but it also profoundly influenced anthropology. Subaltern scholars criticized colonial anthropology not only for its complicity in colonialism but also for its essentialist and reductionist depictions of subalterns. Furthermore, through critical engagements with the works of anthropologists such as James Scott and Benedict Anderson, subaltern studies scholars raised useful questions for anthropologists regarding issues such as the relevance of class in social conflict and the presumed universality of the idea of the nation-state. Subaltern studies also counts within its ranks several anthropologists whose contributions include studies of the construction and silencing of gender in anticolonial nationalist discourse, of the "primitive" in the colonial institution of indentured servitude, and of the relevance of liberal democratic ideas such as "tolerance" in the context of ethnic conflict. Such anthropological works also helped add clarity to ongoing debates within the discipline around the viability of some long-held assumptions, most significantly the assumption that premodern societies were static and unchanging in comparison with Western societies, which, through colonialism and capitalism, embodied the dynamic and universalizing tendencies of modernity.

Historical Particularism and Incorporation

In the early 1980s, anthropologists led by Eric Wolf mounted a profound challenge to the historical particularism that dominated anthropological approaches to the study of non-Western cultures. They argued forcefully for a holistic perspective that made it possible to see why it was problematic for anthropology to view cultures as hypothetical isolates when in fact they were already incorporated to varying degrees into a global capitalist system

of production, exchange, and consumption. The conquest of the Americas, trans-Atlantic slavery, and colonialism had rendered much of the world "global" far before 20th-century anthropologists set about studying it. Wolf and others were intent on showing that an understanding of the interconnectedness of the world would enable us to view particular cultures as being actively involved in constituting global modernity, instead of being static, unchanging isolates that were affected by it. However, despite the force of this analytical shift, there remained a problem that continues to concern anthropologists especially in the contemporary era of globalization. When the focus is on incorporation into a global system, do we not run the risk of ignoring how the specificities of particular societies may shape politics and history? How then may we account for the agency of those being incorporated into the global capitalist system?

Challenging the Incorporation Hypothesis

It was also in the early 1980s that subaltern studies emerged, questioning the dominant view that politics in large parts of the colonized world could only be understood in terms of the incorporation of these parts into an expanding capitalist world system. It argued that the incorporation hypothesis essentially reduces vast populations into static subjects of Western domination and fails to account for the actual complexities and contradictions of the outcomes of colonialism. At the same time, the focus was not so much on dismissing the reality of capitalism or colonialism as on establishing a basis for reconstructing history by viewing changes through the myriad experiences of those marginalized by conventional historiography as "people without a history." In this sense, the efforts of subaltern studies were immensely helpful to ongoing debates within anthropology and helped shape a generation of intellectual work that paid greater attention to the lives of marginalized people, silenced voices, and subordinated memories.

Most significantly, the incorporation hypothesis renders invisible and silent the lives of the vast majority of colonial subjects. This is especially significant for the fact that silencing masks the conflicts and confrontations that lay at the heart of the colonial encounter. Thus, the recovery of the history of subalterns is primarily about reconstructing the history of colonialism in terms of conflict and confrontation between the colonial system and its subjects. Though largely focused on specific groups of subalterns such as peasants, women, or indigenous people, subaltern studies is not merely an effort to fill the gaps of history by writing their histories. What subaltern studies offers is an analysis of the active role of socially marginalized groups located within particular contexts of class, caste, and gender relations in constituting the colonial encounter. In this sense, it is also close to the tradition of British social history exemplified by the scholarship of Edward P. Thompson, especially in the sense that it concerns itself with the processes by which subordinated people actively participate in their worlds simultaneously as subjects of power and as autonomous human beings who may sometimes mount spectacular efforts to resist domination. Thus, an early figure of subaltern studies that drew a lot of attention was the insurgent, the recalcitrant subject of colonial power, who was at the same time also a marginalized social subject. Also important to subaltern studies is the emphasis on recognizing subaltern politics as deriving from autonomous sites that encompass culture and identity as much as they do political economy. This facilitates a deepened consideration of culture as a domain where ideas are not just produced and transmitted but also contested, fought over, and mobilized in practical politics.

Insurgents and Nationalist Elites

As a striking counterpoint to the long-held assumption that subaltern populations are steeped in unchanging ties to tradition and social stasis, subaltern scholars have provided ample evidence of tumultuous political activity in agrarian and nonagrarian landscapes in the colonial period. Peasant insurgencies took on a variety of forms utilizing idioms that spanned religion and linguistic-ethnic identity. Most important, insurgencies often challenged the colonial apparatus but were also directed against local power holders such as landlords, moneylenders, and merchants. For instance, in those parts of colonial India with large indigenous populations, frequent revolts also broke out against exploitative Hindu social groups that increasingly settled on foothills adjacent to forest lands. Such insurgencies often appropriated anticolonial idioms and reframed them to mobilize against locally exploitative forces.

The tendency among nationalist historians to frame insurgencies as episodic though formative instances of an assumed national consciousness is problematic precisely because it denies the relevance of localized politics in shaping insurgencies. Yet subaltern studies scholars remind us that the subaltern insurgent must also be considered as a product of contradictory tendencies, often embodying within its politics both the possibilities and the limitations of localized forms of political struggle. Insurgencies often involved the transformation of class struggles into communal/religious militancy and vice versa and could sometimes take on forms that jar with modernist notions of revolutionary practice.

The incorporation hypothesis also becomes untenable when considering the dynamics of anticolonial politics by nationalist movements. For instance, in colonial India, the key figures of Indian nationalism, the colonized elites, were conventionally, in colonialist and nationalist writings, viewed as both subjects and agents of the incorporative processes of colonialism, especially in terms of their success in instituting and consolidating "modern" political structures and practices. Yet subaltern studies shows how the role of colonized elites in the colonial system was much more ambiguous and reflective of their uneasy position in relation to *both* their colonial overlords and the colonized populations they oversaw. Nationalism in the colonial world was thus not the result of the adoption and modification of a Western prototype, but it was something distinctly developed within the context of colonial society. Yet colonial nationalism was never an effort to return to some assumed "traditional" past but was to build a nation-state that was authentically "traditional" even as it embraced "modernity."

Yet subaltern studies also argues that the quest for hegemony by the colonial state and its postcolonial successor has always remained an incomplete and somewhat failed enterprise. This view contradicts the assumption by colonial and nationalist historiographies that national elites won the consent of colonial subjects in staking their claims to a leadership role in the anticolonial struggle. There is an impressive body of evidence marshaled by subaltern studies scholars that show how even in the most momentous anticolonial mobilizations, subaltern groups transformed struggles by framing them into codes specific to traditions of popular resistance and phrasing them in idioms derived from the communitarian experience of working and living together. The colonial state as such is characterized by a form of dominance lacking in hegemony, a condition that some scholars like Partha Chatterjee argue continues into the present era, as national elites stake and defend claims to leadership by asserting authority derived only partially from consent. This incompleteness of power corresponds to the construction of the "subaltern" as simultaneously a construction of power (excluded and subordinated) and a figure of resistance to that power (incompletely and sometimes fragmentarily immersed in relations of consensual hegemonic power).

Methodology and the Problem of Representation

In attempting to reconstruct the history of nationalism as a history of domination and resistance, instead of as a hagiographical account of nationalist leaders or as the trajectory of capitalist incorporation, subaltern studies has to contend with a body of knowledge that is vastly different from that marshaled by the dominant narratives. Simply put, subalterns rarely left behind written records documenting their experiences, aspirations, and struggles. In most cases, subalterns find mention as subjects of the colonial regime, positioned in these documents as peasants, tribals, criminals, prisoners, and so on. So the methodological strategies of subaltern studies scholars included a strong emphasis on interpreting administrative texts, legal documents, court testimonies, prison records, biographies, novels, and so on. In some cases, scholars also made extensive use of oral testimony, reconstructing socially shared knowledge about past experiences, events, and actions. Reconstructing history from fragmentary sources and producing coherent narratives that try to represent the subaltern raises a host of methodological questions—key among them being the question of authorship. Most forcefully represented by the writings of Gayatri Spivak, subaltern studies has developed a fine-tuned attentiveness to the positionality of the scholar in the course of producing authoritative textual representations of subalterns. Nevertheless, scholars such as the historian Sumit Sarkar critique the turn toward literary theory and postmodernism as an indication of a shift away from concerns with subaltern histories and politics. As such, subaltern studies is seen to have shifted

away from its "dissident left milieu," where subalterns figured prominently in contexts of rebellions, struggles, and political conflict, to an enduring focus on Eurocentrism inspired by the work of Edward Said. Yet this shift did not prevent several subaltern studies scholars from deepening their analyses of the subaltern as the locus of domination and resistance. Drawing on and extending the insights of Western scholars such as Michel Foucault for instance, studies of colonial and postcolonial power relations examine the intimate and the micropolitical aspects of power in the making of subaltern subjects.

Subaltern Studies Beyond South Asia

A Latin American subaltern studies group came into existence as a collective response to the intensification of neoliberal policies in Latin America and to the perceived collapse of leftist political initiatives after 1990. Despite the vast differences in context, Latin American scholars find in subaltern studies useful tools with which to theorize the place of insurgency in reconstructing histories of domination and resistance. More broadly, scholars are also attracted to subaltern studies' critique of the idea of a single narrative whereby modernity prevails as premodern forms succumb to its universal power. As such, the subaltern studies attends to a set of theoretical questions similar to those addressed by Latin American critics of development. Subaltern studies, however, can also facilitate the extension of such critiques of development and modernity by offering theoretical tools to engage with questions of identity, culture, and autonomous action, particularly in the context of struggles by women, indigenous peoples, and Afro-Latin American/Caribbean populations.

SUBJECTIVITY

Subjectivity is a contested term within anthropological theory, with little agreement about how it should be defined, studied, or theorized. Since its entry into the anthropological lexicon in the 1970s, anthropologists have used this term to refer to seemingly disparate concepts such as intimate emotional experiences and structural categories of labor systems. These wide-ranging engagements with subjectivity derive from different philosophical traditions regarding the concept of "the subject" and its relationship to epistemology, agency, and the relationships of power.

Philosophical Groundings

Anthropological views on subjectivity historically have diverged along two main lines of intellectual thought: (1) Continental philosophy and (2) postmodern/poststructuralist critiques. The Continental tradition takes the subject as the focus of analysis and is concerned with how subjects create the reality of the world around them. Postmodern

and poststructuralist critiques read the subject as a product of structural forces and relationships of power and focus on these broader dynamics through which subjects are brought into being. Although few contemporary anthropologists fall neatly into these categories and many have worked to develop more integrative approaches (discussed below), these two intellectual traditions continue to structure the field.

Subject as Agent

The Continental tradition (including German idealism, phenomenology, existentialism, and some forms of psychoanalytic theory) emphasizes the subject as a locus of experience and agency. "Subject" in this view refers to a person who is doing, feeling, thinking, or sensing some action, even the action of being. In this usage, the subject is differentiated from the object, which is defined as anything that is not experienced by the subject as being part of himself or herself, including other people. In other words, it is the subject's own consciousness and perceptions that define the parameters of objects in the world and the conditions through which they can be known and understood. Although some theorists emphasize reciprocal relationships between subjects and their environments, the primary focus of analysis is the subject for whom the environment becomes useful. The subject in this view houses the locus of agency and control from which it extends out into the world.

Anthropologists who understand subjectivity from this perspective are interested in how people make meaning in ways that are culturally shaped but are not identical within a social group. People even in very small societies do not think, act, feel, believe, or desire in exactly the same ways. To understand how cultural processes and subjective experience interact, anthropologists take a subject-centered perspective; they spend time getting to know people on very intimate levels, learning how they engage with culturally available meanings, symbols, and values in making sense of their own experiences. By studying near-experience topics such as suffering, healing, spirituality, and mental illness in different cultural contexts, anthropologists seek to better understand interactions between culture (broadly defined) and individual somatic, emotional, cognitive, existential, and relational experiences.

Subject as Position

The postmodern or poststructuralist perspective (advanced by scholars such as Louis Althusser, Pierre Bourdieu, Judith Butler, Simone De Beauvoir, Jacques Derrida, Michel Foucault, Martin Heidegger, Jacques Lacan, Julia Kristeva, Karl Marx, and Ferdinand de Saussure) takes a very different view, emphasizing the subject not as a unique locus of experience and agency but as a product of discourse and structures of power. In this usage, "subject" refers to a *point of view* rather than a specific individual: a point of view that is thought to be intrinsic to (and continually reproduced within) a given structural position. This kind of subject is bound by the social meanings attached to his or her position within a structure (e.g., mother, factory worker, person of color), and these meanings constrain experience to the extent that one cannot easily experience the world in any other way. Proponents of this view often refer to *subject positions* rather than subjects, to retain the analytical focus on structural dynamics that constrain and enable ways of being.

Anthropologists who study subjectivity from this perspective tend to focus on how social and cultural dynamics generate categories of acceptable subjects and how individuals within a particular system are then induced to inhabit them. Which subject positions are sustained depends on the overall dynamics of the system and the existing structures of power. Anthropologists who adopt this perspective generally start with an examination of structural categories and the different subject positions within them, and then they consider the cultural practices through which people learn to inhabit those positions in ways that feel natural and indisputable.

Debates and Divisions

Clearly, different ways of thinking about the subject lead to very different, and sometimes conflicting, understandings of subjectivity. In the former (what might be called the "inside-out" view), subjectivity is closely tied to ideas about the uniqueness of individual experience. Each subject is assumed to have an idiosyncratic engagement with the world that is his or hers alone. While there may be a great deal of resonance with others who have shared similar life experiences, subjectivity in this usage refers to the special lived experience of a person that makes him or her different, at least in some ways, from everyone else. The

works of Georg W. F. Hegel, Sigmund Freud, Paul Ricoeur, Daniel Stern, Edith Stein, and Emmanuel Levinas are good examples of this perspective.

In the latter (what might be called the "outside-in" view), subjectivity is tied to ideas about commonalities of human experience based on how people are positioned within structures of power. In this view, subjectivity is not a unique, idiosyncratic experience of the world but is, instead, a sort of structural lens through which people are induced to see and engage with the world irrespective of their own individual inclinations. So primary is structure in this view, in fact, that there are thought to be no such things as individual inclinations outside the structures of subjectivity. If one does stray outside these sanctioned positions, social mechanisms come into play to correct this "deviance" and to reorient the individual toward the "proper" subjectivity for his or her structural station. Foucault, Butler, Lacan, De Beauvior, and Bourdieu are prominent theorists known for taking this position.

These differences have led to tensions within anthropological theory. Proponents of the outside-in view find fault with the inside-out model for being too focused on the experiences of individual people while discounting the importance of the structures of power that constrain and enable those experiences. Proponents of the inside-out view find fault with the outside-in model for reducing all human experiences to products of discourse and for failing to take seriously the lived realities of being in the world that people contend with in everyday life. They caution that emptying the ideas of "self" or "subjectivity" of their affective, developmental, and individual elements erases our ability to theorize any forms of agency that do not fit within the existing subject positions. If subjectivity is produced by structure, how do we account for deviance? Or resistance? Or change? The outside-in proponents might respond that subjectification (the process of becoming a subject) occurs through multiple competing discourses. From within these webs of differentially charged power relationships, individual people might be able to leverage certain concepts against others or arrange them in idiosyncratic or creative ways that undermine or alter their proscribed subject positions in some way. The inside-out proponents might respond by asking, "Who is it that is doing the leveraging or creating if there is no core subject who holds agency?" And the debate continues.

Integrative Approaches

Although these approaches to subjectivity appear to be quite distinct, they are equally necessary for understanding the lives and experiences of real people. Anthropology is unique within the social sciences in that it attends to macro-, meso-, and microcultural processes simultaneously. Because of this, contemporary anthropologists often struggle to find or develop concepts of subjectivity that adequately capture both its inside-out and its outside-in aspects. Three major areas of recent development have moved toward more integrative models of subjectivity: (1) studies of intersubjectivity, (2) embodiment, and (3) what might be called the mastery of submission. In each of these domains, anthropologists have worked to dislodge theories of subjectivity from debates about structure versus agency or subject versus object (colored as these dualities are by Western philosophical traditions) and to focus instead on locally meaningful categories for understanding human experience that capture both inside-out and outside-in dynamics.

Intersubjectivity

The concept of intersubjectivity, coming to anthropology through both philosophy and psychology, challenges the subject-object division in that it refers to the relationships *between* people, all of whom are considered "subjects" of an encounter. Intersubjectivity involves a concern with theorizing empathy and how self and other cocreate in the process of interaction. Anthropologists interested in intersubjectivity have explored topics such as phenomenologies of experience and theories of mind as cultural processes, attempting to tease out how subjective experience is inextricable from social interaction and cultural meanings. Key theorists of intersubjectivity who have been influential for anthropologists include Mikhail Bakhtin, Martin Buber, Walter Benjamin, Edmund Husserl, Levinas, Ricoeur, Stein, Stern, and Ludwig Wittgenstein.

Embodiment

Another language for collapsing dualities has been that of embodiment. Anthropologists interested in embodiment challenge the subject/object distinction not only in social interaction but also as a ground for existential and metaphysical being.

Immediate human experience, theorists of embodiment argue, is fully integrative, with no a priori distinction between "mind" and "body." Categorizing some experiences as "thought" or "cognition" and other experiences as "sensation" or "somatic" is a second-order process that is entirely cultural and is not endemic to human ways of existing and knowing. Careful and sensitive ethnographic work enables a deeper understanding of locally salient understandings of embodiment and how these relate to other domains of social and cultural life. Philosophers such as de Beauvoir, Heidegger, Hegel, Husserl, Luce Irigaray, and Maurice Merleau-Ponty have been particularly influential in the anthropology of embodiment.

The Mastery of Submission

A third area of challenge to more traditional models of subjectivity comes from an arena that might be described as the mastery of submission. Resonant with important developments within critical feminist theory in the 1980s and gaining traction in anthropology through studies of religious discipline (but extending from there into discussions of race, gender, sexuality, political economy, psychiatry, and a number of other realms), studies of willing submission note that the whole idea of "subjugation" itself is premised on a liberationalist ideal that takes individual freedom and self-determination as the ultimate good. Drawing on Foucault's ideas of "technologies of the self," these studies examine the ways in which subjugation can be a desired or even cultivated state, as when a young woman chooses to join a Catholic convent or adopt Muslim veiling practices. Western scholars have tended to read such actions as either expressions of individual internal conflict (inside-out) or as evidence of structural oppression that induces women to feel that they "must" make such choices (outside-in). Ethnographic studies have shown, however, that such practices are often much more complicated and that they do not fit easily within dominant understandings of agency, freedom, and choice. In this vein, studies of willing submission have worked to disrupt and challenge accepted understandings of processes of subjugation, implicitly (and sometime explicitly) calling into question the entire academic discourse of subjectivity itself. Talal Asad, Bourdieu, Benjamin, de Beauvoir, Foucault, and Kristeva have been important theorists for anthropologists studying willing submission.

Future Directions

Despite—or perhaps because of—the difficulties of studying and theorizing subjectivity ethnographically, it continues to be a vibrant and exciting area of emergence within anthropology. Cultural anthropology is concerned with questions about how people understand the world and why people do what they do. Implicit in the very practice of ethnography, then, is a presumption that human subjectivity, however construed, is a critical feature in the generation, transmission, and transformation of culture. Continuing to develop ethnographically grounded models of subjectivity is therefore not only necessary for successful anthropological work but is foundational to the anthropological endeavor itself.

SUSTAINABILITY

Sustainability, whose etymological roots are Anglo-Norman and Latin, implies a state that is maintainable, supportable, or bearable. In the abstract, its place in anthropology is as ancient as those swayed by Thomas Malthus and others contemplating the impact of the nexus of population, economics,

and resource use on carrying capacity: the impact of human beings on the environment. For them, changes in the material remains of the past were explained as the beginning or end of a people by extirpation, replacement, absorption, or some other process connected to human agency, climate, or the environment. For decades, the presence or absence of conservation became a particular focus; in the late 19th and early to mid-20th centuries the analysis coincided with major declines in forest and faunal resources in North America and elsewhere.

Coupling these processes specifically to ecological or environmentally maintainable (or degrading) activity under the rubric of sustainability, as well as the deliberate, self-conscious use of the concept of sustainability, emerged quite recently in time. Not until the 1980s did sustainability come into common use in anthropology, other disciplines, and the public consciousness. The floodgates opened especially wide in the years 1987–1995, when suddenly sustainability was on everyone's lips, where it has remained ever since.

The emergence of sustainability in anthropology and related fields such as sustainability science and sustainable development is linked to the 1987 publication of the Brundtland Report (World Commission on Environment and Development) and to the 1992 United Nations Conference on Environment and Development, also known as the Rio or Earth Conference. By "sustainable" (as regards development), Brundtland meant the ability to meet one's needs in the present without negatively affecting the ability of future generations to meet theirs. Neither this nor any other definition of sustainable or sustainability is easily made concrete; indeed, the very slipperiness of the concept of sustainability has plagued efforts to make it operational. Nevertheless, in the wake of Brundtland and Rio, interest in sustainability quickened considerably. As with conservation, the broader context influenced its growth: the vastly expanding global context of deep concern for the environment, biomes, species, biodiversity, and climate change—the concern, no less, for the future of life itself.

While the focus on sustainability in post-Brundtland anthropology is undeniably presentist, it unfolds into spheres that look backward for evidence of sustainability success and failure or into the present for behavior in which sustainability is a goal. Both past-looking studies and studies of the present reference the link to sustainable global futures—in the hope either that we, as human beings, learn from and not repeat history's unsustainable courses or that we develop ways that prove to be sustainable. In both, sustainability is at times conflated with conservation; yet simply because a society or resource use exhibits sustainability does not mean that human beings have acted with conservation as a goal.

The backward-looking cluster consists largely of the analysis, by archaeologists, environmental historians, and historically minded anthropologists, of evidence for societal sustainability or collapse or for the sustainable or nonsustainable exploitation of resources. It has attracted the most attention, with the lion's share going to societal sustainability or collapse, thanks mainly to Jared Diamond's provocative *Collapse: How Societies Choose to Fail or Succeed* (2005), which attributed the disappearance of Easter Islanders, temple-building Mayans, the Anasazi, and others elsewhere in the world to environmentally unsustainable habits and lives—all framed in the belief that the world today is on an unsustainable course. The debate over the thesis is robust, with many arguing that with a long view, specific cases exemplify not collapse but the resilience of a people or language, even if a particular societal course (political structures, monumental architecture, etc.) or particular use of resources (forests, fauna) appeared unsustainable as the society changed due to as-yet poorly understood systemic causes. The resilience of a societal system—its absorption of perturbation and retention of basic underlying structural elements—plays an important role in these reformulations.

Many have lowered their sights from societies to specific resources. Increasingly nuanced and fine grained, their work is likely to conclude that the data will remain partial, or that a story of extirpation, extinction, or hunting down trophic levels (from larger to smaller prey) will remain open to change. This work eschews global generalization. It takes the position (e.g., in the ancient harvest of maritime resources) that if the record is sufficiently long, it is marked by both success (resilience, continuity) and failure (extirpations, unsustainability); that climate surely played a significant role that often remains obscure; and that human impact was the least in ancient times, greater as populations increased and technology became more sophisticated, and the greatest in contemporary industrialized society. Yet in specific ancient cases, the exploitation of shellfish,

fish, sea turtles, birds, and seals and other mammals led to depletions, extirpations, and extinctions; that is, in place and time, these harvests were unsustainable.

Persistent problems in the analysis of sustainability are spatial and temporal scales (from local to global, from short to long term—the long view); the uneven nature of evidence for a postulated unsustainable human footprint on the land or the resources; and the lack of clarity on the degree to which climate or other environmental factors complicated or obscured human behavior. Nevertheless, with The United Nations Conference on Sustainable Development (known as Rio +20) in 2012, the framing of sustainability will no doubt continue and so should sustainability studies, including the analysis of sustainability within anthropology.

Swadesh, Morris

Morris Swadesh (1909–1967) came of age when American linguistics was a wholly owned subsidiary of American anthropology. The founders and early disciples—Franz Boas, Edward Sapir, Alfred Kroeber, Leonard Bloomfield, and Robert Lowie—were firmly in control of the directions that anthropology and linguistics would take in North America.

Swadesh was born in Massachusetts to immigrant Jewish parents. As with his teacher the great Edward Sapir, Yiddish and other Eastern European languages swirled about in the family ether, a fact that disposed him toward anthropology and linguistics.

Precocious, slightly insufferable, Swadesh attended the University of Chicago, where he came under the influence of Sapir's charm (Sapir, whom Leonard Bloomfield called "the witch doctor"), following Sapir to Yale in 1930. He completed his PhD dissertation (*The Internal Economy of the Nootka Word*) under Sapir's supervision in 1933.

Swadesh had what we would call today an "attitude." This complicated things throughout his life. Trying to help Swadesh get a teaching position at Berkeley, Sapir wrote to A. L. Kroeber saying that he recommended him highly despite a "certain asperity of temperament." Swadesh eventually got a position at City College of New York, which he lost in 1949 as America moved into what now is called the "McCarthyite" period. Swadesh, whose politics were well left of center, emigrated to Mexico, where he finished out his career at the Universidad Nacional Autónoma de México and the National School of Anthropology and History.

In Swadesh's formative years, the 1920s and 1930s, linguistics was a "big tent" discipline in which all kinds of the "scientific study of language" flourished, something that is no longer true. If it had anything to do with language, it was fair game for the linguist. And since social constructs are language bound, anything in anthropology was fair game as well.

Swadesh, following the master's lead (Sapir wrote elegant poetry and became seriously involved in psychoanalysis and the movement for an international auxiliary language), luxuriated in the freedom and anarchy of the early days. His range of interests and research remains remarkable even today. The bibliography of his published works comes to some 234 items. (This bibliography is taken from the most useful account of Swadesh's work in anthropology and linguistics we have: Morris Swadesh, in *The Origin and Diversification of Language*, edited by Joel Sherzer.)

Fieldwork was the ruling ethos in early American anthropology and linguistics, and Swadesh worked either firsthand or secondhand on scores of American Indian languages: Nootka, Chitimacha (Louisiana), Northwest Sahhaptin, Tarasca, Inuit, Unaalic, Zapotec, and Otomi, and on and on. In addition, he published on Mandarin, Basic English, the phonology of American English, translation, semantics, and (again) on and on.

Swadesh's great triumph in the early days was his missionary dissemination of the then revolutionary concept of the *phoneme*—the idea that a sound could have "meaning" quite apart from its phonetic structure. Swadesh's early article "The Phonemic Principle" (1934) helped put the phoneme on a theoretical pedestal where it remained until the 1960s.

What Swadesh remains best known for, however, is the subject of his last book, *The Origin and Diversification of Language* (1971). When did spoken language arise, and how did languages become different? *When* did they split off from each other? Swadesh believed that that *when* could be quantified, and to that end he invented what is known as *glottochronology*: the study of the rate of change occurring in the vocabularies of languages for the purpose of calculating the length of time (time depth) during which two related languages have developed independently.

To conduct a glottochronological analysis you start with a list of culturally neutral universal words (known now as the "Swadesh 100-Word List" or for greater precision the "Swadesh 200-Word List"). On either list would be *man*, *woman*, *bird*, *one*, *all*, for example, words almost always present as lexical items in any language. *Computer*, *nerd*, and *mosh pit* would not be on the list. Take two languages that you believe to be genetically related, calculate the percentage of cognates they share from either of the Swadesh lists, and apply a formula similar to the one devised for Carbon-14 dating, and in principle you will get a number that tells you when the two languages diverged.

There are too many problems with glottochronology, both mathematical and practical, for it to be relied on in the way an archaeologist can rely on Carbon-14 dating. For example, varieties of spoken Arabic remain lexically close because of the authority of the *Qur'an*, and Afrikaans is farther from Dutch than we know it to be—there was all that borrowing in South Africa from the languages on the ground. Swadesh's assumption that basic vocabulary is replaced at a constant rate—about 19% per 1,000 years—is shaky. But glottochronology works about as well as many things taken for granted in linguistics, and if you have nothing else to use to establish time depth of divergence and not a lot of time to take a trip to the field, you could do worse than start with glottochronology.

Glottochronology is in its particulars flawed, but its underlying questions about the origins and diversification of languages seem eerily prescient at a time when historical linguistics has been revolutionized by DNA. We know more now than ever before about the prehistory of languages, thanks to mitochondrial DNA. We know, for example, that everything started out in Africa. We know how and when language traveled from Africa to Australia. We know that Etruscan had origins in the Middle East. Pre-DNA, we could only guess at such things.

When the history of the modern revolution in historical linguistics is written, Morris Swadesh will have a well-deserved if modest footnote in the early goings-on of that history. He didn't get everything right, his enthusiasms knocked him off the rails again and again, and DNA wasn't available, but he deserves credit for asking the right questions. And he asked the most interesting question there is: "When and why did *Homo sapiens* start talking?"

Not, on the whole, a bad legacy!

Symbolic and Interpretive Anthropology

The school of thought known as symbolic and interpretive anthropology emerged in the 1960s and 1970s in opposition to materialist, scientific approaches to the study of culture. The symbolic and interpretive theorists believed that the interpretation of cultural phenomena, in their multiplicity of forms, must begin and end with the analysis of symbols and their multivalent meanings. They were interested in how local people in a variety of settings used symbols to render their social worlds meaningful. Like the British structural functionalists who preceded them, they emphasized long-term fieldwork based on close interaction with the "natives" as the best, if not the only, way of understanding culture. Like Franz Boas, the father of American anthropology, and his students, symbolic and interpretive theorists believed that symbols were best analyzed within the specific cultural contexts in which they were found.

Early Influences

Symbolic and interpretive theorists were influenced heavily by the French sociologist Émile Durkheim, in that they tended to view cultures primarily as coherent systems. Even if they first appeared unintelligible, symbolic systems would eventually make sense once trained anthropologists succeeded in cracking their code and ascertaining their internal logic. This could be accomplished only through careful observation and analysis of a people's symbols and rituals, which symbolic anthropologists believed constituted a people's culture and shaped their worldview.

Symbolic and interpretive anthropologists also borrowed their basic approach from psychoanalysis, specifically Sigmund Freud's interpretation of dreams, although Freud's influence on this school of thought is often forgotten. Before Freud, scholars believed that dreams were too bound up with primal emotion and animalistic drives to be approached scientifically and understood. Freud argued instead that a trained analyst could make sense of dreams: that their logic and coherence could eventually be determined through rigorous analytical work. The symbolic and interpretive theorists applied this general orientation and approach to the study of symbols and rituals. Although they took from Freud the notion that symbols contained deep cultural meaning, they rejected the universal meanings that Freud allocated to symbols, such as the phallic symbolism of elongated objects, and instead insisted on culturally specific meanings of symbols.

Many symbolic and interpretive anthropologists were also influenced by Claude Lévi-Strauss's theory of structuralism, such as the British anthropologist Mary Douglas in her work on food taboos and on "natural symbols" in the Hebrew Bible (known in Christianity as the Old Testament). The symbolic and interpretive theorists also borrowed from the field of linguistics, especially the work of Ferdinand de Saussure and Edward Sapir, and from philosophy, for example, the work of Paul Ricoeur, Ernst Cassirer, and Wilhelm Dilthey.

Topics of Study and Basic Approaches

Although scholars do not normally identify specific "schools" within symbolic and interpretive anthropology as a whole, there are two basic approaches that, although overlapping, differ slightly: a British version, exemplified by the work of Victor Turner, Mary Douglas, and Raymond Firth; and an American version, including Clifford Geertz, David Schneider, and Sherry Ortner. The first group was influenced by Durkheim and structural functionalism, in that they were interested in how societies remained cohesive, even in the face of social change

and conflict. The latter group shared Max Weber's concern for how ideas shaped individual subjectivities and actions. Although Turner was trained by Max Gluckman at Manchester and Geertz by the Harvard sociologist Talcott Parsons, an important synergy developed between Turner, Geertz, and David Schneider when their careers overlapped for a time at the University of Chicago. Because of this, the United States is usually considered symbolic and interpretive anthropology's specific place of origin.

Borrowing from the field of linguistics, symbolic and interpretive anthropologists defined "symbol" as something that stands for something else, where there is no intrinsic relation between the symbol and its meaning. From this general starting point, individual theorists developed more specialized, idiosyncratic definitions. For example, Turner referred to symbols as "the building blocks of ritual." Raymond Firth defined the symbol as a device enabling abstraction with some end in mind. What exactly that end was, however, varied depending on one's basic orientation. For Turner and the British theorists, symbols performed certain functions in a society, for example, they might heal an afflicted person or transform young neophytes into full-fledged adults. The American theorists, in contrast, saw symbols more as vehicles of meaning that shaped people's worldview. For example, in her chapter "Gods' Bodies, Gods' Food: A Symbolic Analysis of a Sherpa Ritual" (1975), Ortner argued that the ceremonial food offerings for the gods were a key symbol for understanding social hospitality among the Buddhist Sherpas in Nepal. In both cases, analyzing a people's symbols was key to understanding the culture itself.

British symbolic anthropologists diverged from the American theorists in their basic orientation toward culture. Influenced by Boas, the American theorists viewed culture as an autonomous entity. For the British theorists, however, culture did not exist apart from social structure and, more specifically, apart from its instantiation in social action. This basic contrast shaped these theorists' orientations toward the study of symbols. These two groups of theorists also differed in the emphasis they placed on emic, or "insider," interpretations of symbols, and on etic, or "outsider," ones. While capturing the native's point of view was key for the American theorists, for the British theorists, this was but one of many things the anthropologist needed to consider. Turner, for example, outlined a basic methodology for interpreting ritual symbols, combining observation, native meanings, and the anthropologist's interpretation. Turner thus acknowledged that anthropologists' interpretations differ from native ones, due to the former's scholarly training, to which the latter are not usually privy. This is reminiscent of the structural anthropologist Claude Lévi-Strauss's earlier distinction between conscious (native or "home-made") and unconscious models of social structure. Lévi-Strauss argued that, although they are different, both hold value to anthropologists in the field.

Symbolic and interpretive theorists varied in the extent to which they considered behavior in their works. While Douglas and Schneider tended to emphasize the rules and structures of symbolic systems as abstracted from actual behavior, Geertz and Turner paid more attention to how these rules and structures were played out, upheld, or even subverted in social action.

Beyond defining symbols and exploring their basic roles in society, symbolic and interpretive anthropologists also identified different kinds of symbols. Douglas was interested in the universality of certain symbols, such as those pertaining to the human body: for example, hair and blood. She described such symbols as microcosms for understanding society: Systems of symbols were, in short, a kind of native social theory. Turner and Ortner identified what they called "dominant" and "key" symbols, respectively. These symbols, they argued, could be understood apart from a culture's wider symbolic system. They stood alone, representing a culture's most important values and even the culture itself. Turner described three properties of dominant symbols: condensation of meanings, unification of disparate meanings, and polarization of meanings, the latter infusing symbols with the power to engage both societal principles and emotional states. Turner contrasted dominant symbols with "instrumental"symbols, or worker symbols, which could only be understood in their relationship to other symbols and which served to meet specific goals.

Major Theorists and Their Contributions: The British Approach

Victor Turner focused on the symbols and rituals of the Ndembu people of Zambia. Turner argued that at the heart of Ndembu society was a central conflict

between matrilineal descent and virilocal residence. That is, although the Ndembu traced their descent through the mother, women resided with their husbands after marriage, thus dividing the matrilineal kin group. Turner explained that enacting this irresolvable conflict through elaborate rituals or "social dramas" enabled the Ndembu to live with this paradox rather than be torn apart by it.

In *The Ritual Process* (1969), Turner built on the Belgian folklorist Arnold van Gennep's work on *rites de passage*, which he defined as rituals that accompany all changes of state in social life. In *The Rites of Passage*—originally published in French in 1909 but not translated into English until 1960—van Gennep argued that rites of passage exhibited a universal tripartite structure, consisting of (1) "separation," or the physical removal of subjects from their normal state; (2) "limen," where subjects are in-between states; and (3) "aggregation," where subjects are reintegrated into society as changed beings. Turner focused on the limen phase, describing its unique attributes. "Liminal" subjects, according to Turner, were "betwixt and between": They were egalitarian, ambiguous, and stripped of property and power. According to Turner, the liminal phase exhibited especially rich symbolism that expressed the neophytes' ambiguity. Turner explained that precisely because of their ambiguous state, close bonds developed between liminal subjects, what Turner referred to as "communitas" or "anti-structure." In Turner's model, social life everywhere consisted of alternating periods of structure and anti-structure—periods in which social principles were emphasized and periods in which they were temporarily suspended, even subverted.

Douglas also dedicated her career to the analysis of religious symbols. She conducted fieldwork among the Lele of the Belgian Congo (present-day Democratic Republic of Congo), focusing specifically on animal symbolism. She eventually extended her analysis beyond the Lele, however, to explore cross-culturally topics such as table manners, jokes, and ideas about risk.

Douglas is known most for her work on taboo and pollution, concepts she argued all religions exhibited. In *Purity and Danger* (1966), she defined dirt as "matter out of place," arguing that it could only be understood in relation to wider ideas about society. In particular, ideas about purity were related to a society's classificatory system or to the ways in which members categorize and, thus, make sense of their social world. For Douglas, ideas about pollution and taboo were actually clues to understanding a particular culture's established ideas about order and disorder.

In devising an anthropological interpretation of Old Testament food taboos, for example, Douglas argued that the early Israelites deemed animals "unclean" when they did not conform wholly to their classification system—that is, when they did not fit into the tripartite classification of the universe as outlined in Genesis: four-legged animals walk or hop on the land, scaly fish swim in the water, and two-legged birds fly in the sky. Because shellfish crawl rather than swim in the water, they threatened the order of things and were rendered a taboo food.

In *Symbols: Public and Private* (1973), Raymond Firth reflected on the scope and meaning of symbols, outlined the development of anthropological interest in symbolism, and contrasted public and private symbolization. Firth wrote that symbolic anthropologists were interested in how people in other societies think about symbols, how they behave symbolically in daily life, and how they consciously interpret the meaning of symbols. He described symbols as instruments of expression, communication, knowledge, and control, and identified symbolic action as one of the key domains through which anthropologists can explore the dissonance between statements or actions and their underlying meaning.

Firth explained that anthropologists have emphasized "public symbols," those collectively upheld in myth and ritual. But there are also "private symbols," or symbols held by individuals that correspond to personal concerns. Examples include dreams and prophetic revelations. Firth argued that anthropologists should pay more attention to the relationship between public and private symbols: how they affect or even contradict one another in the contexts of everyday life.

Major Theorists and Their Contributions: The American Approach

David Schneider was one of the most influential American symbolic anthropologists. In *American Kinship: A Cultural Account* (1968), Schneider was concerned with the internal logic of the symbolism of kinship in America. He identified the logical relationship among the central symbols, such as

"person," "relative," and "in-law." He outlined how the constituent parts created the system of meaning of American kinship, including what made a person a relative and, similarly, what made a relative a person. He outlined the categories of relatedness in American kinship: people who are thought to share "blood" and are thus joined by nature, and people related by marriage—those who were joined by "law" and characterized by the absence of "blood." At the core of the system, Schneider argued, is the act of sexual intercourse within marriage, which unifies the "nature" and "culture" opposition and provides the foundation for both forms of relatedness.

Schneider was concerned less with patterns of behavior than with culture as a set of idealized units and rules that may or may not be upheld in everyday practice. He believed that anthropologists should separate "patterned behavior," what people do or even what they say they do, and "culture," a second order analysis that allocates meanings to practices.

Sherry Ortner wrote a seminal work titled "On Key Symbols" (1973), in which she defined the concept of "key symbols" and outlined a methodology for their identification and analysis. Similar to Victor Turner's notion of dominant symbols, according to Ortner, symbols are "key" when people identify them as important, when natives are emotionally aroused by them, and when these symbols appear in a wide variety of contexts. Key symbols also have a greater elaboration surrounding them, and there are more restrictions governing their use as well as sanctions regarding their misuse. Ortner explains that anthropologists can use two basic methodological approaches to identify key symbols. First, they can analyze a culture or symbolic system for its most basic value orientations and then look for the symbol that best represents these. Second, anthropologists can observe a symbol that seems "key" and then analyze it for its cultural meanings.

Ortner identifies two basic types of key symbols: (1) "summarizing" and (2) "elaborating." Summarizing symbols sum up or represent for participants what their culture means to them. These are often sacred symbols or objects of worship, and they do not tend to inspire much reflection. The American flag is one example. "Elaborating" key symbols, in contrast, sort out complex ideas and emotions so that these can be understood, communicated to others, and acted on. There are two types. First, there are "root metaphors," which order the world by providing basic orientations—for example, Dinka cattle herders in Sudan speak about various social relationships in symbolic terms related to cattle. Second, on the Northwest coast, ceremonial feasting and gift giving (Potlatch) provide a key scenario for understanding social action.

The most influential figure in the American branch of symbolic and interpretive anthropology was Clifford Geertz. In *The Interpretation of Cultures* (1977), Geertz searched for a theoretically more powerful concept of culture than those established by the early evolutionists (in particular, E. B. Tylor's "complex whole" definition) and outlined a basic methodology for the study of culture. Geertz proposed a semiotic theory of culture—that is, culture dealt with symbols and their complex meanings. Following Weber, he argued that human beings were suspended in cultural webs of significance of their own creation.

According to Geertz, what anthropologists "do" is ethnography, and they do this in the field, through establishing rapport, by selecting informants, and through the act of writing. Ethnography entailed, Geertz argued, "thick description," deciphering layers of meanings as they unfold in the contexts of everyday life. The anthropologist's goal, according to Geertz, was to understand a situation and then explain it to others through writing. Whereas the British symbolic anthropologists never explicitly broached the subject of writing in their work, Geertz identified it as central to the anthropological endeavor. This was a crucial insight as Geertz proposed that ethnography involved the creation of written works that were better approached with the tools of literary criticism than with those of the natural sciences.

One of Geertz's most important contributions to symbolic and interpretive anthropology was his discussion of the location of culture: It is not located inside people's heads but is, in contrast, public, and it can be observed firsthand. Cracking the code of culture and communicating this in ethnographic writing for Geertz, however, inevitably involved interpretation. Indeed, he argued that anthropological writings constitute "second-order interpretations," which are removed from the first-order interpretations that only natives can make. Ethnographic writing is thus fictional, in that it is fashioned or made; it is imaginative, incomplete, and indeterminate. For Geertz, the analysis of culture was not, therefore,

an experimental science in search of laws but an interpretive one in search of meaning.

The most famous example of Geertz's approach is his analysis of a Balinese cockfight. Although cockfighting was illegal at the time of Geertz's fieldwork, cockfights were common and held deep significance for the Balinese people. Geertz argued that the cocks symbolized masculinity and animality: In identifying with his animal, a Balinese man confronted both his ideal and gendered self, and also what most repulses and fascinates him. Geertz identified the structure of the cockfight, interpreting it as a mirror of the hierarchical Balinese society, a playing out of conflict, and a form of art. Most important, the cockfight is, like all cultural phenomena, a "text" that can be read. In the same way that a person may have a strong identification with a football team, may organize his life around the season, and may be very affected by the outcome of the team's matches, the cockfight is a story the Balinese tell about themselves: about who they should be, who they could be, and who they actually are.

Critiques and Contemporary Status

One of the most common critiques of symbolic and interpretive theorists is the lack of specificity in their interpretations. It is not always clear, according to critics, to what extent a particular symbolic interpretation is due to the anthropologist's own training or unique positionality (e.g., his or her ethnicity, gender, training, and specific life experiences), and to what extent it may be attributed to the "natives" themselves, who are equally positioned subjects.

Symbolic and interpretive anthropologists have also been criticized for downplaying, or ignoring altogether, political and economic realities, particularly the notion of power. Critics have accused them of ignoring, for example, how dominant groups endow symbols with meanings that contradict the meanings attached to them by subordinate groups. Along these lines, many have been accused of being antihistorical in their analyses, of neglecting the historical processes that give rise to a particular symbol's meaning. Finally, symbolic and interpretive theorists have been accused of overly romanticizing the cultures they study, downplaying how meaning is created through engagement with a wider world of globalization and conflict.

Although symbolic and interpretive anthropology is generally defined as a historical period within the discipline, contemporary anthropologists were either trained by major figures in this field or simply use symbolic or interpretive analyses in their work. Those who work under this designation today have retained a focus on long-term fieldwork and the pursuit of local meanings, and in their research and writing, they tend to emphasize religion over political economy. But these two topics are not mutually exclusive in the contemporary period, and many who work with political and economic issues, such as Arjun Appadurai, John and Jean Comaroff, and David Kertzer, adopt symbolic and interpretive approaches.

Symbolic Interactionism

Symbolic interactionism is a micro-sociological perspective. Its proponents view human society as the product of everyday interactions based on shared meanings. Meaning is constructed through the use of symbols in a fluid process in which social roles emerge through conscious or subconscious negotiation. This perspective has been influential among sociologists and social psychologists. While relatively less frequently referenced by cultural anthropologists, its major assumptions are similar to those of qualitative and interpretive anthropology.

History and Basic Concepts

George Herbert Mead (1863–1931), a major figure in the pragmatist school of American philosophy, believed that humans are dynamic actors for whom knowledge is an instrument for problem solving. They are not, in other words, puppets of unseen, deterministic forces of history, economics, social class, or the environment, and their behavior can be understood in terms of shared subjective meanings or *significant symbols*. His contemporary, the sociologist Charles Horton Cooley (1864–1929), suggested that we become who we are based on how we think others see us, a concept he called the "looking-glass self." Another key piece of the conceptual landscape of symbolic interactionism was provided by William I. Thomas (1863–1947) and Dorothy S. Thomas (1899–1977), whose eponymous theorem holds that if one defines a situation as real (whether or not it is objectively so), then there will be real consequences, since people act on what they *think* is happening rather than on what is objectively happening.

These basic insights were codified by Mead's student Herbert Blumer (1900–1987), who coined the term *symbolic interaction*. Blumer came to believe that significant symbols are shared in the process of social interaction, which is based on our ability to interpret and define the actions of others. We do not react to others' actions (as the behaviorist psychologists of his era suggested) but rather to the meaning that we attach to those actions. Words and gestures are the most commonly deployed symbols, but the human symbolic repertoire also includes body language, clothing, religious or patriotic artifacts, architecture and landscaping, artistic expressions, and choice of recreational activities, all of which can be used by people to define themselves. These symbols may be modified depending on how others choose to interpret a person's *presentation of self*, a concept closely associated with Erving Goffman (1922–1982), who developed an understanding of social roles through a dramaturgical analogy: Human social behavior follows a kind of script, and individuals are role-playing actors. Despite the presence of a script, however, roles always have an improvisational quality, which introduces a measure of uncertainty to the social process. We must interpret the cues provided by others, and so we are creative participants in our environments, not passive players of prearranged parts.

As human beings use symbols in meaningful ways in the process of interaction, they become conscious, self-reflexive, and active shapers of their own behavior. A social act is one in which one's behavior takes others into account and is shaped by others' perceived reactions. It is thus the basic unit of analysis. Culture is the system of shared meanings that make social acts possible. The most significant interactions are usually those that characterize intimate relations among family members and/or members of the peer group, but people can and do interact in meaningful ways with larger reference groups and, increasingly, with vast and unseen "virtual" communities. Symbolic interactionists do not contend that economics or the other large forces play no part in shaping the world, but they pay particular attention to the way people interpret the world and how they respond to those interpretations.

The process of interaction leads to temporary, socially constructed, and negotiable relations. Stability comes not from a fixed set of institutions, statuses, and roles but from a consensual agreement about the nature of the social process itself. A useful analogy might be to a football game. Each game has its distinct characteristics, depending on the lineup of players, the conditions of the field, and so forth. Each game is, of course, governed by a set of rules that everyone acknowledges, but we cannot predict

the outcome of any given game simply by memorizing the rule book. The game will certainly follow the rules, but its outcome will depend on how particular players interact with one another under the particular conditions that obtain at the time of the game.

Interactionists' interest in symbols, negotiated reality, and the social construction of the self is expressed through an analysis of the roles people play. Humans take on acceptable roles to the extent that they are capable of entering into the perspective of others and of trying to figure out what their actions might mean to those with whom they interact. Interaction, however, also depends on our ability to make new roles for situations that are ambiguous or unfamiliar.

Research Methods and Affinities With Cultural Anthropology

Blumer's followers in sociology and social psychology have relied on qualitative ethnographic research methods. As such, they have made common cause with many cultural anthropologists, although the latter do not typically label their theoretical perspective "symbolic interactionism." There is, however, an underlying conceptual link with symbolic or interpretive anthropology as espoused by Clifford Geertz (1926–2006), who famously adopted Max Weber's image of humans as beings suspended in webs of self-spun significance. Geertz championed the study of culture as an interpretive process rather than as one based on experimental science.

Microlevel social research dealing with interpersonal interactions and the social construction of self-identity has often been conducted using the participant observation stance commonly associated with anthropology. Interactionist research requires close contact with the people being studied, as well as immersion in the everyday activities of those people, the better to understand the meanings of actions and the processes by which those people construct encounters. As anthropologists have long recognized, this sort of immersion necessarily involves a degree of subjectivity that some sociologists, bred in a tradition of value-neutral research, have tended to resist. Symbolic interactionists in sociology and social psychology thus share epistemological ground with many cultural anthropologists rather than with quantitatively oriented members of their own disciplines.

Symbolic interactionists use participant observation–based ethnographic techniques to study socialization, which leads to their understanding of that process as a reciprocal one in which the identities of parents (and other caregivers) are shaped through interaction with children almost as much as the children's self-concepts are formed by the training they receive from their elders. Such research has also clarified the idea that socialization is not simply something associated with childhood; each person is constantly being socialized and resocialized as he or she enters into new relationships in new interactive settings.

Ethnomethodologists in sociology and ethnolinguists allied with anthropology share with symbolic interactionists a commitment to small-scale, face-to-face, and immersive research. Ethnolinguists have been interested in the way language both shapes and is shaped by cultural contexts. Ethnomethodologists have made significant contributions to the study of basic conversations, revealing how turn taking and alternative conversational maneuvers are developed and deployed in social situations. They have, however, tended to view meaning as intrinsic to the minds of individuals, who impose it on social life through individual practices; symbolic interactionists, by contrast, have understood meaning as behavioral and collective, arising out of the processes of communication.

A variant strand of symbolic interactionism is represented by Manford Kuhn (1911–1963), a quantitative sociologist. Kuhn and his associates (the Iowa school) were critical of Blumer's Chicago school and its focus on the particularities of interactions, at the expense of seeking broad generalizations about human behavior. Contemporary interactionists have effected a rapprochement between the two schools, but they are in general still relatively more committed to qualitative research. They have focused on studies of the self and the dynamics of the interactive encounter in settings as varied as schoolrooms, public restrooms, mental hospitals, street gangs, and monasteries. Studies of virtual communities have demonstrated how language can be used to authenticate identities in the absence of standard visual and aural cues. Social identities in cyberspace, no less than in "real" space, are not objectively defined roles to be assumed but are the result of specific, ongoing, emergent, and negotiated social interactions.

Because of their continuing interest in socialization and the self, symbolic interactionists have also contributed to modern gender studies. Gender, like other elements of one's social identity, is seen as a construct arising out of the exchange of significant symbols in the process of interaction. This perspective has also influenced studies in the sociology of deviance and the anthropology of disability through the development of labeling theory, which emphasizes the ways in which people label behaviors or attributes that violate norms. Labeling theorists argue that what we call deviant or disabled is the result of how we respond to the labels (which carry symbolic weight) rather than to the behaviors as objectively defined. Interactionists prefer to see both deviance and disability in relativistic rather than absolute terms.

Interactionists have also made important contributions to the study of social movements by developing resource mobilization theory, which holds that a social movement is not likely to emerge and spread—even when the economic or social conditions seem to provide fertile ground—unless a group of individuals are willing to interact with one another in such a way as to accumulate the resources (both material and symbolic) needed to sustain the movement. People are likely to join a social movement when they are part of an existing social network that provides an established system of contacts and communication through which individuals can be recruited into the movement.

Criticisms and Conclusions

Symbolic interactionism began as a response to positivistic social science. Its adherents tend to favor descriptive accounts of particular encounters over macrolevel theories involving overarching social institutions or abstractions like social class. Like other social researchers who use qualitative ethnographic methods, symbolic interactionists are sometimes criticized for being untheoretical and hence of representing a humanistic rather than a scientific perspective. Interactionism has generated generalizing, explanatory theories, such as labeling theory and resource mobilization theory, but the emphasis remains on detailed accounts of how those general factors work in particular situations. It is certainly true that the emphasis of interactionist research has been on the micro level of the social encounter, but interactionists do acknowledge macro forces to the extent that they form part of the context in which personal encounters develop.

Another criticism of symbolic interactionism has been that it has had limited impact on social policy. Interactionists' research, which is often relativistic and reliant on subjective analysis, tends to favor narrative description over statistical analysis. This makes it difficult for policymakers to use it. It should be kept in mind, however, that the roots of interactionism are in the pragmatic movement in American philosophy. There is no inherent reason why interactionist research cannot contribute to policy, although it is probably most effectively applied at the local level concerning particular programs.

Symbolic interactionism is a distinctive perspective on social life. It emphasizes meaning and the personal encounter and looks to evolving social process rather than to fixed structures as the basis of human socialization and group life. Studies of the self, emotion, social roles, and negotiated order, all of which are important to modern sociology, social psychology, and cultural anthropology, have been influenced by the symbolic interactionist perspective.

Systems Theory

For decades, in one form or another, systems theory has permeated multiple fields of study. Its purpose is a simple one—to facilitate the examination of why there is order in our world. It is more than a specialized disciplinary construct that directs observations and structures analysis; it is a *way* of doing science that (a) creates a framework for articulating complex observations in a coherent manner, (b) facilitates an understanding of the interrelationships between the various elements of analysis, and (c) forms a bridge spanning disciplines that encourages intellectual cross pollination.

Overview

Looking at our world, both natural and social, there are two characteristics everyone can agree on: It is both (1) complex and (2) ordered. Science is a methodological and conceptualizing process that attempts to simplify the observed complexity and to understand the mechanisms behind the order. There are two basic approaches one can use in this process. The most common and traditional option is to identify a single element of study and to analyze it largely in isolation from its context. We can label this approach reductionist or bottom up—going from the specific to the most general. For example, a biologist studies the frog as an organism, or an anthropologist studies a culture's kinship terminology as a cultural construct. The second option is to study these objects within a more complete natural and cultural context. This approach is more top down—from the most general to the most specific. For frogs, one would study their interactions within their habitat or environment—an ecological approach that recognizes that the frog has an impact on, and is in turn affected by, its environment. For kinship networks, one would study the familial relationships as they articulate within higher social and political systems. In each case, the initial object of study is viewed as an element in a network of subsystems that interact to create the ordered whole we ultimately are most interested in understanding. Systems theory is a formalization of the latter approach.

Inherent in any definition of *systems* is the idea of some whole composed of interacting parts (subsystems). The recognition that all aspects of our world can be conceptually decomposed into sets of interacting parts spawned a paradigm in which the world is seen as a matrix of discrete subsystems connected by mechanisms that exchange information or energy. This exchange process has the ability to either maintain or transform the "state" of the subsystems and, subsequently, the whole. Although the ancient Greeks, the Romans, and later thinkers expressed some systems concepts, it was not until 1937 that a formal definition of general systems theory was presented by the Austrian biologist Ludwig von Bertalanffy, at a University of Chicago conference.

Bertalanffy's argument contrasted the tendency of sciences, especially biology, of mimicking physics' (i.e., the ultimate science's) atomistic focus on the smallest or singular element as the primary analytical unit—the reductionists' approach noted above. In biology, one studied the cell in great detail without regard to its existence in a much larger context of the organism, which, in turn, existed and interacted within a larger ecological realm. Organisms are more than just cell aggregates. The sum of the parts does not equal the whole. Anthropologists likewise often focused their studies on individual cultural elements, such as kinship, language, technology, material items, and so on, to the exclusion of their collective roles within a much larger and complex matrix of human interactions and behaviors. Culture, then, is more than a collection of human constructs.

Although, for centuries, reductionism was the predominant norm of science, Bertalanffy noted that every science, social or physical, had theoretical components that recognized the place of interacting elements within a larger whole. He argued that for the sciences to be useful they must broaden their analytical scope to encompass the relationships between the elements with the goal of understanding how these interactions define the whole. Implicit in this view is the recognition that all sciences share a framework commonality that at the highest philosophical level links them together as science. One outcome of this perspective is the expectation that science should be a multidisciplinary reasoning process, given this shared framework and the fact that the components of systems often span disciplinary specialties. Furthermore, analogies should exist between disciplines that might enhance their

research methodologies—that is, disciplines should be able to (cautiously) borrow tools from other disciplines. For example, the incorporation of open system thermodynamic principles borrowed from physics might serve the study of human cultures by anthropologists. In this way, systems theory became a method of abstraction that spanned all disciplines.

Following Bertalanffy's recognition of interacting components, the focus of systems research shifted away from the reductionist's elements of analysis in favor of the interchange of information and/or energy between subsystems. William Ross-Ashby, in his explication of the mechanism of this interchange, incorporated the concept of *homeostasis*—the ability of a system to maintain itself at or near equilibrium by means of feedback mechanisms between subsystems. Norbert Weiner and others formalized the study of the structure of this process as the field of *cybernetics*. In simplest terms, systems theory applies a worldview that what we observe is composed of subsystems that interact via structured feedback mechanisms in a way that either maintains the current state (negative feedback or first cybernetics) or alters that state (positive feedback, second cybernetics, or multiplier effect) into a new form, preserving the whole in a new way.

In the late 1940s and early 1950s, a group of multidisciplinary researchers met in what became known as the Macy Conferences to discuss and develop the concept of systems theory as it applied to the human mind. William Ross Ashby and Weiner were key participants along with two anthropologists, Gregory Bateson and Margaret Mead. Bateson became the leading proponent of systems theory within anthropology as he applied the theory to understanding the workings of the mind. For Bateson, systems theory provided a framework for placing the brain (i.e., an individual) within the context of a greater whole (i.e., the cultural system). The mind was not seen as separate or independent from the various subsystems it was an active part of. Archaeologists, however, have been anthropology's loudest incorporators of the approach, and it is their application that will be used here to delineate an anthropological application of systems theory.

Systems Theory in the Social Sciences

Archaeology in the 1960s and 1970s witnessed a theoretical revolution referred to as *processual archaeology* or *new archaeology*. At its most basic level, the movement attempted to recreate archaeology as a "science" that concentrated on the "processes" empowering culture change. In the spirit of systems theory's multidisciplinary approach, processual archaeologists heavily borrowed research analogs from other disciplines. This was especially true of their incorporation of the systemic mindset of systems theory. Many of these archaeologists used the systems view to organize their observations, but one in particular, Kent Flannery, best articulated its value to processual studies.

Flannery's application examined the development of agriculture in Mesoamerica. Prevalent views on the origin of agriculture tended to focus on singular causes like climatic change, population pressure, and so on, forcing societies to adopt a sedentary lifestyle supported by domesticated species. Archaeological remains suggested such explanations were inadequate largely because the change slowly took place over centuries of time. Flannery viewed cultures as integral components of their immediate ecological surroundings. These ecological systems included the plants, animals, physical conditions, and weather/climate impacts, each conceptualized as a dynamic subsystem. For centuries, Mesoamerican subsistence systems (another subsystem) developed protocols to extract resources designed around seasonality (When are the plant foods ready for harvest and the animals most easily hunted?) and scheduling (At any given time, where do people need to be to take advantage of seasonality?). Changes to the subsistence subsystem could sufficiently alter the population dynamics of animals and plants necessitating a concomitant adjustment in the subsistence system to maintain the needed supply of these resources. This back-and-forth interaction is a classic example of systems theory's concept of negative feedback—responses designed to maintain the status quo.

Flannery argued that the shift to domesticated resources was a slow one, as demonstrated in the culture chronologies. He envisioned subtle, probably accidental, changes in the genetics of plant resources that slowly shifted their value within the subsistence base from low to high. The changes could have been the result of random mutations or human interaction encouraging the reproduction of some characteristics (like maize kernel size and row number) over another. These minute alterations over time accelerated in a positive feedback process

eventually creating a dependence on these domesticated species of plants. As the shift toward more controlled and predictable resources occurred, there was a concomitant change in the scheduling and seasonality constraints. Population size increased under reduced nutritional stress leading to an increasing aggregation into larger sedentary groups, which in turn subjected social and political systems to change. For Flannery, systems theory provided a process-driven conceptualization of culture as an integrating component within a larger system of interacting and dynamic subsystems. Accepting this view shifted archaeology away from the specific (i.e., the oldest, the biggest, the first, etc.) in favor of the general (i.e., the processes involved in cultural evolution).

During the same period, ethnographers conducting research under the paradigm of cultural ecology—the study of societies within their environmental context—were also inclined to organize their observations around Systems Theory perspectives. Roy Rappaport became ethnography's most eloquent prophet of systems thinking in the presentation of his research on New Guinea societies. Systems theory, born out of biology's ecological paradigms, was a natural fit for ethnographers doing ecological research. Rappaport's application focused on the adaptive value of the interacting cultural components within their environmental context and not on their more traditional functional aspects. He was particularly interested in delineating how subsystems exhibited system maintenance qualities as they worked to stabilize the flow of critical elements, such as protein intake, within a society's limitations (e.g., technology, climate, land resources, etc.). This form of homeostasis was not, however, changeless in form. Maintenance in the face of external changes would require internal adaptations to the system components as well as their interactions. Homeostasis did not equate to a formal status quo.

Additionally and perhaps most important, Rappaport emphasized the potential of cultural systems to become destructive in nature as they reacted to feedback. What might best serve the homeostatic balance could eventually be system-destroying. Ideally, cultural elements must exist to minimize this effect. Rappaport saw New Guinea rituals as serving this purpose. The *kaiko*, or yearlong pig festival, served to systematically cull the herds in order to maintain pig populations below their environmentally destructive levels. Rituals evolved to buffer the long-term negative impact of the system's success in maintaining critical protein resources (pigs). The function of rituals could only be defined within the broader context of subsystem interactions. Rituals, in a sense, are the control mechanisms of systems on the edge of self-destruction.

Critics

Critics of systems theory judged its viability based on their perception of social science goals. Their tone was more one of disinterest in this avenue of research than a denial of the systems argument that elements of study are part of a network of interactions. Many postmodernists were quick to associate the concept with a mechanization of culture when, often explicitly, the role of the individual was ignored (e.g., R. L. Ackoff, C. W. Churchman, and N. Luhmann). The individual appeared to be a pawn in some programmed environment. Such criticisms were amplified by the postmodernists' emphasis on the individual, which contrasted with the processual generalists' denial of the role of individuals in the grander scheme.

During the early developmental period of systems theory, the emphasis of social science was shifting away from smaller units of analysis in favor of understanding the individual(s) in his/her/their context. But the further one steps back, the smaller the individual can become. Eventually, culture can be described as a "black box" with inputs, outputs, and hidden mechanisms of interaction. Since the 1980s, there has been a shift back to the individual in what are collectively referred to as "agency studies." However, the individuals or agents are often viewed within a larger whole or system. Agents are seen as simultaneous creators and consumers of their cultural structure. Examples can be found in the recent and extensive social network research. Systems Theory's framework concepts are still useful in representing agent interactions. Today, General Systems Theory may be nearly axiomatic in its conceptual usefulness. Research arguments implicitly accept the interconnectedness and instead focus on the nature of interactive mechanisms. Integrated with complexity theory, game theory, and information theories, systems theory is still the "skeleton of science."

Tambiah, Stanley

Stanley Jeyaraja Tambiah (1929–), a Sri Lankan anthropologist, is mostly known for his performative theory of rituals; studies of the interrelations among Buddhism, politics, and society in Thailand and Sri Lanka; and explorations of ethnic violence in South Asia.

Early Life and Influences

Stanley Jeyaraja Tambiah was born in 1929 into a Tamil Christian family. He received his primary and secondary education at Saint Thomas College in Colombo, a colonial institution modeled after English public schools. At the University of Ceylon, he studied economics, with sociology and anthropology as secondary fields. There he met the American sociologist Bruce Ryan, who first introduced Tambiah to the practices of fieldwork, organizing weekend research trips to local villages. These experiences had a lasting impact on Tambiah's young mind and fostered his interest in local culture and villages, which would direct much of his intellectual trajectory. In 1951, Tambiah went on to do his PhD in sociology in Cornell University, with anthropology and social psychology as secondary subjects. There he worked under the supervision of Robin Williams, a former student of Talcott Parson and Robert Merton, strengthening Tambiah's engagement with the work of Max Weber and Émile Durkheim. After graduating from Cornell in 1954, Tambiah went back to his alma mater, where he taught sociology. In 1957, Tambiah initiated his first long-term participant observation in collaboration with Gananath Obeyesekere. Concurrently, Tambiah entered into conversation with Edmund Leach, who recognized the promise of the young sociologist but harshly critiqued his use of quantitative surveys. It was Leach who convinced Tambiah to abandon this approach and to adopt more qualitative methods.

The "Thai" Years: Myth, Ritual, and Histories

In 1960, Tambiah was invited to become the leading anthropologist of a United Nations Educational, Scientific, and Cultural Organization/Thai research unit on rural education. This assignment generated three monographs and established Tambiah in the field of anthropology. The first text, published in 1970 with the title *Buddhism and the Spirit Cults in Northeast Thailand*, explored how Buddhism as a civilizational force structured the social life of a Thai village. For the most part written in Cambridge, where Tambiah began teaching in 1963, the book revealed the influence of Edmund Leach, who introduced him to structuralism and Claude Lévi-Strauss. After this first project, Tambiah decided to further his analysis of Thai Buddhism by approaching it as a totality, examining its connections with larger social, political, and state formations. The outcome, *World Conqueror, World Renouncer*, was completed in 1976, the year in which he moved to Harvard University, after teaching for 3 years at the University of Chicago. In this text, he analyzes the historical oscillations, a theme dear to Leach, in the structural

relations between Buddhist monks as renouncers of worldly life and Buddhist kings as righteous rulers and protectors of Buddhism. Tambiah, influenced by his conversations with Marshall Sahlins in Chicago, proposed a rethinking of the relation between history and anthropology, through Sartre's critique of the anti-historicism of structural anthropology. While *World Conqueror, World Renouncer* followed rural monks moving to urban centers to gain education and social mobility, Tambiah's third monograph, *The Buddhist Saints of the Forest and the Cult of Amulets*, published in 1984, focused instead on the monks who remained at the periphery of state power. In it, Tambiah explored the Weberian theme of charisma, its transferal to relics and amulets, and their uses in manipulating economic, political, and historical processes.

Theoretical Engagements

After the Thai trilogy, Tambiah condensed his more theoretical reflections into two books, which are often celebrated as his main contributions to anthropological theory. The first, *Culture, Thoughts, and Social Action*, published in 1985, dealt with two classic themes of anthropological inquires: rituals and cosmologies. In the first part of the book, Tambiah proposes, through a mix of structural analysis, J. L. Austin's pragmatics, and Charles Sanders Peirce's reflection on indexes, a reading of rituals as performative acts, enactments of cultural conceptions that generate social reality. A similar attempt to study these totalities animates the second part of this book, which analyzes the relation between cosmologies and social structures in Southeast Asia.

It was again an interest in totalities that oriented Tambiah's second theoretical intervention, *Magic, Science, and the Scope of Rationality*, published in 1992. In the text, Tambiah reconstructs a cultural history of the categories of magic, religion, and science in Western thought and anthropological theory. While he individuates two modes of human thought, one concerned with causality, logic, and classification and the other concerned with participation and experience, he refuses to separate them and sees them as both operating in science as well as in magic.

Return to Sri Lanka: Ethnic Violence in South Asia

Following the violent anti-Tamil riots in Colombo in 1983, after years of estrangement from Sri Lanka and its tumultuous politics, Tambiah went back to his native land to explore collective violence in its relation to ethnic and religious dimensions. Another trilogy was the result. The first book, *Ethnic Fratricide and the Dismantling of Democracy*, published in 1986, examines the genesis of the 1983 violence and its underlying political dynamics, showing ethnic conflict and the demise of democracy as two sides of the same coin. In the second text, *Buddhism Betrayed?* Tambiah explored the historical development of political Buddhism in Sri Lanka to solve the dilemma of how such heinous violence could be possible in a country largely dominated by a religion that teaches nonviolence. Starting from this question and an engagement with Gustave LeBon's and Émile Durkheim's discussions of collective ritual, effervescence, and crowds, Tambiah published in 1996 his last monograph, *Leveling Crowds*, which focused on ethnonationalist conflicts and violence as a means to conduct democratic politics in South Asia. Tambiah is currently the Esther and Sidney Rabb Research Emeritus Professor of Anthropology at Harvard University and now resides in Boston.

Tax, Sol

Although most widely remembered today for his organizational contributions, particularly the founding of *Current Anthropology*, Sol Tax (1907–1995) was also an experienced and innovative scholar and an influential teacher and mentor. His contributions to Robert Redfield's project in Mesoamerican

economic development were significant at the time, but his "action anthropology" is increasingly relevant as the discipline rediscovers collaborative and applied approaches and internationalist perspectives.

Biography

Tax was born in Chicago on October 30, 1907, the third of four children of Russian Jewish immigrants, who were secular and socialist leaning despite a rabbinical ancestry. Shortly after his birth, the family moved to Milwaukee, then one of the centers of progressivism in the United States, where the family's political inclinations were reinforced by the local milieu. Small and shy as a child, Sol nevertheless dreamed of somehow saving the world from its troubles. His entrepreneurial aspect was also evident early: By the age of 12, he was active in the Newsboys' Republic—a local organization of paper carriers, with their own publication (which Tax went on to edit). He also served as chief justice of their "supreme court" and lost a closely contested election to be president.

After graduating high school in 1925, Sol and his older brother went to Florida, working to make money for college as assistant circulation manager at the Miami *Daily News*. Sol then spent one quarter of his money at the University of Chicago, before transferring to the University of Wisconsin due to financial pressures; there, he continued to be quite active in political and organizational causes—sometimes to the detriment of his studies. He began by intending to major in political science and economics, but a chance reading of Robert Marrett's *Anthropology* (1912) led him to sign up for Ralph Linton's first anthropology course at Wisconsin, and he quickly decided that anthropology's relativist appreciation of human diversity was the best fit with his interests and philosophy.

In 1930, Tax went to Algeria with Beloit College's Logan Museum expedition. The anthropology he was learning was Boasian four-fields in approach, and the archaeological focus of that project would provide field experiences and supplement the other areas he was studying in the classroom. The expedition crew lived and worked closely with the local people, and Tax spent Passover there with a family of Algerian Jews; he wrote about that experience for his first anthropological publication. His bachelor's thesis sought to integrate the cultural and biological aspects of anthropology, and he insisted that "therapeutic science" (applied anthropology) must rest on a foundation of "pure science." Tax then participated in Ruth Benedict's Summer Ethnology Program with the Mescalero Apaches, before beginning graduate work at the University of Chicago.

At Chicago, Tax worked with A. R. Radcliffe-Brown and Robert Redfield, but he continued his connection with Linton and always considered him as his main influence. Radcliffe-Brown supervised Tax's fieldwork in 1932–1933 with Central Algonquian groups (in 1933 accompanied by his new wife, Gertrude Jospe Katz Tax) and then in 1934 with the Fox (Meskwaki) Indians in Iowa, which formed the basis for his dissertation. During this work, Tax developed an "egoless" kinship diagram, using color-coded bars to show all terms of address between charted individuals, not just tracking through a designated "ego"—and taking advantage of a color-printing process developed by his brother.

Following his defense in 1934, Tax left for Guatemala with his wife to join Redfield's Middle American ethnographic project. That commitment, intended to complement Redfield's research in Yucatan, continued over the next 8 years and led to the publication of *Penny Capitalism* (1953) as well as the edited volume *Heritage of Conquest* (1952). The economic studies of this project were widely influential, although limited by delays in publication from the time of their original preparation. The project, and Tax in particular, also explored cultural persistence in a context of change, an early effort to qualify the more dominant models of acculturation and to recognize agency for all participants.

In 1940, Tax was given a research appointment at Chicago, and in 1942, he began teaching anthropologists in Mexico, including a 6-week field program in Chiapas. Those students, including liberal students exiled from Spain by Franco as well as Mexicans, raised again for Tax the necessity of considering the relationships between anthropological science and social problems. Also during this period, Sol and Gertrude's two daughters, Susan and Marianna, were born. Both spent much of their infancy in the field with their parents, and Susan later followed her father into the profession, as an anthropologist of Spain.

In 1945, Tax joined the faculty of the University of Chicago as associate professor; he was promoted to professor in 1948, served as assistant dean in the Division of Social Sciences in 1948–1953, and

chaired the anthropology department in 1955–1958. His initial charge had been to develop a new graduate curriculum in anthropology, which became the 3-year sequence of comprehensive training that characterized the Chicago program for more than a decade. He remained in Chicago for the rest of his career, retiring from teaching in 1976 but remaining active in campus life into the 1990s—including attending thesis defenses for many candidates working in Native American communities. Sol Tax died of a heart attack after a short illness on January 4, 1995.

From Field-Worker and Theorist to Organizer, Facilitator, and Editor

With his promotion in 1948, and the subsequent assumption of institutional obligations, Tax effectively shifted from a role as an active field-worker and anthropological theorist to one as an organizer and facilitator—although in his formulations, these roles were not as distinct or separate as many tend to see them. The many students who came to the university after the end of the Second World War needed teaching and training, and the discipline (from Tax's perspective) needed institutions and orientations to study and to seek to improve the problems facing so many people in the postwar world. Tax sought to contribute on both fronts, through the development of an applied field training program, on the one hand, and professional organizations and venues for publication, on the other.

In early 1948, Tax began plans to train graduate students in fieldwork methods with a specific focus on working with local communities to define social problems and develop possible solutions, returning to his earlier field site in Iowa to work with the Meskwaki Indians in a project that continued for more than a decade and came to be known as "The Fox Project." This was the origin for "action anthropology," a collaborative approach involving anthropologists with a group of people united around a project of solving some problem or problems. This approach is explicitly distinct from the more common modes of applied anthropology that work in the service of some particular agency or group. The distinctive quality of action anthropology was to explicitly demand that the anthropologist's scientific desire to learn something and the community's desire to solve problems were equally significant and neither could be inferior to the other. This approach was one of the first to insist on the agency of all participants, which was fundamental to the need for inclusivity. The project began with concerns around acculturation and assimilation but quickly recognized the importance of alternative value systems, the inevitability of conflict—both within the community and within and among the scholars—and the necessity of a dynamic, pragmatic, and dialogic approach to theory, grounded in the social realities of the field situation. Consensus building as used among the Native societies themselves was one of the models employed in the attempt to move away from hierarchical, paternalistic structures. Eventually, Tax came to view the ideas of assimilation and acculturation themselves as coming from colonialist sets of values that cast progress against preservation—regardless of which was valued positively—and are thus counter to fundamental rights of self-determination.

Concurrently with these developments, Tax pursued institution building for the discipline not just at Chicago but nationally and internationally. He was involved in the reorganization of the American Anthropological Association in 1945–1946 and served as associate editor (1947–1952) and editor (1953–1955) of *American Anthropologist*. He also edited three volumes of selected papers from the 29th International Congress of Americanists, *An Appraisal of Anthropology Today* (1953) from a Wenner-Gren Symposium (with Loren Eiseley, Irving Rouse, and Carl Voegelin), and *Evolution After Darwin* (1960) from the Darwin Centennial conference at the University of Chicago. In 1958, with support from the Wenner-Gren Foundation, Tax founded *Current Anthropology* as an explicitly internationalist journal with a holistic vision of the field and dedicated to scholarly dialogue, and he served as its editor until 1974. He also edited the Viking Fund Publications in Anthropology series from 1960 to 1968. These activities sought not only to develop and structure the discipline but also to encourage and facilitate the dissemination of anthropological methods, approaches, and findings to others within and beyond the discipline and the academy.

The two strands, action anthropology and institution building, came together in the 1961 American Indian Chicago Conference. Planning began in 1960 with the recognition that the time was ripe for a reconsideration of federal Indian policies in light of

the issues and problems in the Native communities. Tax attended the Denver convention of the National Congress of American Indians to pitch the idea, and it was met with strong support—including an offer of funding. Further funding was obtained from the American Anthropological Association and others. Tax defined his role as that of a coordinator rather than a "leader," and he worked with the Native scholar and activist D'Arcy McNickle in planning the event, seeking to draw in all possible factions and perspectives. In the end, about 600 people participated—more than 450 of them Indians, representing close to 100 tribes—plus several hundred members of the Chicago Native community who joined some of the events. In addition to plenary sessions and open debate, there was feasting and dancing on the Chicago Midway late into the night, contributing not only a social atmosphere but also the community spirit necessary for consensus building. The formal result was a Declaration of Indian Purpose that sought more active participation and self-rule in tribal–federal government relationships, but perhaps more important, the gathering helped develop personal and tribal networks that contributed to Pan-Indian political activism over the next decade and a half.

Beyond Native concerns, in the 1960s, Tax also was involved in more general issues of social conflict in the United States, including urban conflict and the war in Vietnam and its draft, and he organized conferences and edited publications in these areas as well. His last major professional activity was presiding over the Ninth International Congress of Anthropological and Ethnological Sciences in 1973 (where he also attempted a nonhierarchical, dialogic structure) and editing the 90+ volumes of papers in the *World Anthropology* series that ultimately came out of it. Along with *Current Anthropology* (and its dialogic "CA" treatment"), this can be seen as the foundation for today's projects of engaged, collaborative, and world anthropologies.

Tedlock, Barbara and Dennis

Barbara Tedlock (1942–) and Dennis Tedlock (1939–), referred by those in the field as "the Tedlocks," are a team, one rarely found in academia, whose lives and research are as intertwined as they are separate. Having met at Berkeley with the discovery of a mutual interest in 1960s poetry and performance, they set on a course of study and publication remarkable for its insights into the poetics and aesthetics of society and culture. Early in their professions, they coedited *Teachings From the American Earth: Indian Religion and Philosophy* (1975), which was an international success, reissued in 1992, 2000, and 2007 and adopted as the main text in Native American studies around the world. *Teachings* heralded the Tedlocks' lifelong commitment to engaging students in the understanding and appreciation of Native American cultures. From 1993 to 1998,

the Tedlocks were editors-in-chief of the *American Anthropologist*, and they were awarded the 1997 American Anthropological Association President's Award for their distinctive leadership in forging a new vision for the journal—emphasizing anthropology's scientific *and* humanistic approaches.

Barbara Tedlock's scholarship covers a wide range of topics, from shamanism to dreaming, aesthetics to historiography, yet throughout she has shown a consistent commitment to understanding the cultural workings of symbols. Early in her career, she questioned the objectivity of the participant-observer and, along with like-minded colleagues, set out to reconfigure ethnographic epistemology with an alternative approach that combined the "participant as observed" and "narrative ethnography." Both the observed participant (the anthropologist as observer *and* observed) and narrative ethnography address the nature of the relationship between Self and Other, not only as it develops in the field but also as it plays out in the writing later. Tedlock made the scientific and moral claim that ethnographic data are coproduced, gathered in conversation with others, and filtered by the life experiences of the interlocutors within an interactive Self-Other dialogue. Reliable data arise from "intersubjective" rather than (intra-)objective field experiences. Tedlock countered her critics, who accused her of devaluing the objective goals of science, by arguing that social science could only advance if it combined, rather than segregated, the empirical orientation of science with the analytical, critical, and exploratory approach of the humanities.

In her book *Time and the Highland Maya* (1982), Tedlock turned the tables on traditional ethnography by introducing a problem-oriented approach to a genre that more characteristically organized its data into discrete categories—the economy, the household, religion, and the like. Wanting to understand how the Quiché Maya of Guatemala comprehended time, she soon discovered that timekeeping permeated all sectors of life in such a way that compartmentalization of the topic into a discrete chapter would be impossible. Debunking the accusation that "going native" meant risking one's claims to scientific insights, Tedlock, the granddaughter of an Ojibwa herbalist and midwife, gained direct access to timekeeping wisdom by apprenticing to a shaman, an expert in calendrical knowledge. After 4½ months of intense training that culminated in an indoctrination ceremony, she gained insight into how the highland Maya divine not only quantities but qualities of time, especially as they concern human affairs.

In *Dreaming: Anthropological and Psychological Interpretations* (1987), an edited volume, Tedlock wrests the discussion of dreams from the hands of Jungian and Freudian analysts, with their focus on the individual dreamer, universal archetypes, and the unreal nature of dreams. Noting that reality itself is "an indeterminate concept influenced by imaginative and symbolic processes" (p. 1), she posits the thesis that dreams in many cultures have complex communicative processes and social realities, and enjoy a status as high as or higher than other experiential memories, including those drawn from waking states. In *Dreaming*, Tedlock pushes the methodologies of the observer-observed out to include the Self, suggesting that there is value in having an awareness of one's own dreams and filters on reality while studying those of others.

In *The Beautiful and the Dangerous: Encounters With Zuni Indians* (1992), Tedlock takes on Western philosophy with the introduction of "ethnoaesthetics," a bold attempt to move discussions of beauty from the academy to the village: Just how does the Other see, create, and discuss it? She found that the Zuni do so with two terms, *tso'ya* ("beautiful") and *attanni* ("dangerous"), creating a dynamic that influences the composition of most designs, including the sacred Shalako wall designs. In *The Beautiful*, Tedlock, an artist herself, continues to explore the Self-Other relationship by bridging memoir to ethnography and by writing herself into the narrative. In *The Woman in the Shaman's Body: Reclaiming the Feminine in Religion and Medicine* (2005), Tedlock steps back from specific cases to scrutinize the historiography of shamanism and reshape the discussion of the worldwide phenomenon, long dominated by scholars (e.g., Géza Róheim, Mircea Eliade, Norman Whitten, and Robert Torrance) who claimed that shamanism was a predominantly male practice. Rereading earlier scholarship, while assembling her own field notes from Guatemala and Mongolia, other ethnographies on shamanism, and the mounting archaeological and paleontological evidence, Tedlock reaches the unorthodox conclusion that women were most likely the original shamans, not men, thereby challenging

more than 100 years of "objective" social science claims to the contrary.

Dennis Tedlock's scholarship has focused on language, particularly the literary complexities of Native American stories. Shifting the focus away from what he saw as the limitations of literary criticism, especially with its preference for printed texts and its Eurocentric notion of "great literature" (i.e., written and read in Indo-European languages), Tedlock's analysis of Native American storytelling has focused on the fluidity of prose in performance. In Tedlock's scenario—much like Barbara Tedlock's—truth is dialogical and intersubjective.

A published poet and the son of an English professor, Tedlock draws on Charles Olson, who in his essay "Projective Verse" (1950/1966) argued that poetic verse is best if it responds less to the traditional, poetic conventions of meter, rhyme, syntax, and semantics and more to the qualities of sound and the physics of breath. Native narratives, Tedlock argues, ask for different kinds of mindfulness when they embed formulaic genres of prayer, oratory, and poetic recitation within their shape-shifting figures. They raise the breath, voice, gestures, intonations, incantations, pauses, and silences of the raconteurs to an essential level, as they do the temporal and spatial layering of enactment, including audience engagement. Yes, the who, what, when, and where of the plot are critical to the meaning of a story, but their existence depends on the performance.

As early as the 1970s, Tedlock's treatment of storytelling challenged the structuralist assertion that myth, the core of many Native American tales, is a method of overcoming time. As Tedlock describes in *The Spoken Word and the Work of Interpretation* (1983), after listening to his recordings, a method distinct from the reading of transcripts, he discovered that the "*internal* timing of the performance . . . not only in its sequences but also in the proportions of its durations" (p. 5) and the syncopation of storytellers conversing with their characters, audience, and ethnographers were used in an effort to expand, explore, honor, and journey with time. For Tedlock, translation has been the key challenge. Not only do Native American stories originate in languages that are unrelated to English, but the multisensory and multitemporal aspects of their production must be turned into written notation, if it is to be replicable by readers.

Throughout his career, Tedlock has radicalized practices of translation by attending to performance as constitutive of both medium and message. His most notable achievement in this area is his edition of *The Popol Vuh: The Mayan Book of the Dawn of Life* (1985), recognized by critics as a *tour de force* in the interpretation of ancient texts and awarded the PEN Translation Prize in 1986. In it, Tedlock engages in *ethnopaleography*, a term he coined and introduced in *The Spoken Word and the Work of Interpretation.* Ethnopaleography refers to a practice of translation that takes a text (e.g., *the Popol Vuh*'s post-European contact, in alphabetically written form) back in time via contemporaneous resources (e.g., archaeological) to its possible original production (which, for *the Popol Vuh*, was likely enacted, as suggested by the narrator within the text). It does this while looking for clues in contemporary spoken arts to aid in the process. The result is Tedlock's reconnection of a two-dimensional written (500-year-old) text to its far older, presumably spoken, origin and to its multidimensional reconstitution into a breathing document.

For Tedlock, the art of translation is not only academic but political, a sentiment that was sown in his first publication, a magazine for poets, *Alcheringa/ Ethnopoetics: A First Magazine of the World's Tribal Poetries* (1970–1980), coedited with the poet Jerome Rothenberg, in which he reached out to contemporary Western poets to engage in experimental translation of works by marginalized artistic communities. In addition to a series of books that are as much *festschrifts* ("fixed scripture") as academic exegeses of native poetics, Tedlock has published a collection of his own poems, inspired by non-Western poets in content, meter, and metaphor, and a book of photographs, which examines the narrative of architecture and its quotidian uses. The sum of Tedlock's efforts in translation, while introducing new ethnographic data, methods, and theories to a scholarly readership, has, above all, been to honor the storytelling of Others, by placing it on an equal footing with Indo-European or Western literature.

The sum of both Dennis and Barbara Tedlock's efforts might be found in one of the missions of *Alcheringa/Ethnopoetics: A First Magazine of the World's Tribal Poetries*: "To combat cultural genocide in all its manifestations."

Thick Description

Thick description is an approach to cultural analysis popularized by the anthropologist Clifford Geertz in the introductory essay of his 1973 book *The Interpretation of Cultures*. This method involves densely textured descriptions and explanations of social acts and activities, which strive to uncover the layers of cultural significance underlying them. This effort by social researchers to construct actor-oriented understandings of meaning is necessarily interpretive. Geertz's position that ethnography (cultural anthropology's principal method of inquiry) is fundamentally a project of thick description and his definition of culture (anthropology's chief organizing concept) as interconnected webs of significance render thick description a more or less complete explanation of what anthropologists should do—that is, endeavor to identify and represent the cultural contexts in which behaviors and the meanings behind them are embedded in order to figure out what people are *really* up to. Cultural anthropologists today recognize Geertz's articulation of thick description as a seminal moment in debates over the discipline's position as closer to either the social sciences or the humanities. Geertz's work also helped usher in the next generation of ethnographers who championed more literary approaches to ethnographic writing and analysis. The remainder of this entry expands on the notion of thick description through (a) a brief overview of its initial articulation by the philosopher Gilbert Ryle, (b) a discussion of the debates and criticisms surrounding Geertz's application of thick description, and (c) an elaboration on its significance and legacy.

Gilbert Ryle and Thick Description

Although Geertz introduced thick description as an important concept in anthropology, he in fact borrowed both the term and the best known example for explaining it from the Oxford philosopher Gilbert Ryle. Through a series of thought exercises, Ryle juxtaposed the idea of a "thin description"—that is, a surface-level explanation of a directly observable act—with a "thick description," which additionally presents the intentions of social actors as well as the reasons for and meanings behind their behavior. The most famous of these exercises considers the thinly described contracting of an eyelid as either an involuntary twitch or an intentional wink. Ryle demonstrates that a contracting eyelid only becomes recognizable and understood as a wink with an awareness of the cultural context and circumstance—both the social codes through which a wink takes on meaning and the various situations that might prompt its use. Methodologically, this distinction highlights the importance of ethnographic embeddedness. In other words, simply being present to observe and record an act will not suffice—any video camera can document a contracting eyelid; the researcher must be familiar enough with the social environment to (at least attempt to) understand the meanings that actors attribute to their actions.

Criticisms of Thick Description

Criticisms of thick description primarily come from two camps. Anthropologists committed to more

objective social scientific principles see Geertz as attempting to thrust social inquiry into an interpretive quagmire. For example, positivists such as Paul Shankman and materialists like Marvin Harris view thick description's lack of systematic analytical rigor as a form of anything-goes relativism and regard Geertz's thickly descriptive writing as excessively wordy ivory tower musings that don't say much of anything and make little to no effort to address the pressing issues facing contemporary society. On the other hand, researchers predisposed to an interpretive approach, including postmodernists like Vincent Crapanzano and Graham Watson, cite a number of ambiguities and/or contradictions in Geertz's explanation of thick description and how to go about doing it. One common source of confusion concerns the relationship between describing and explaining. Although scholars frequently reference "thick description" to mean the former, as an approach to cultural analysis it is incomplete without the latter. Explaining the circumstances, intentions, and meanings behind a wink may seem straightforward enough. However, for more elaborate cross-cultural situations—including most of the concrete examples of thick-description-at-work offered by Geertz—sorting out the layers of significance underlying different actors' actions and motivations involves a considerable imaginative leap. While Geertz appears comfortable in moving from descriptive accounts of cultural contexts to diagnostic understandings of the frames of interpretation that guide social actors' behaviors, critics such as Crapanzano argue that his explanations are often too neat to account for the inherent contradictions and tensions of lived reality and, furthermore, lack sufficient evidence for how he reaches his interpretive conclusions. To this end, Crapanzano characterizes Geertz's writing as deliberately illusive and perpetually inconclusive. Another ambiguity surrounds the difference between describing/explaining particular situations and generating knowledge about either the broader society or social life on the whole. Geertz clearly promotes thick description as an effort toward cultural theory building rather than a means of studying particular places. Yet, as such, he advocates for the intrinsically unfinished nature of cultural analysis, arguing that the aim of (interpretive) anthropology is to progressively refine what are inevitably unresolvable on-the-ground debates regarding the nature of social life.

Thick description, which came of age during a particularly acrimonious moment in anthropology, was unquestionably introduced in response to the scientific models that dominated the discipline during the 1950s and 1960s. It in turn influenced a generation of social researchers—within anthropology and beyond—suspicious of hard (social science) facts and dedicated to more literary approaches to ethnographic representations. This postmodern turn in anthropology, which reached its apex in the mid- to late 1990s, moved from a Geertzian understanding of social life as a text to be read and interpreted by researchers to the position that ethnographers not only describe/explain but, in fact, construct culture through the process of writing about it—advocating for a cultural anthropology that is very much akin to literary scholarship. Such attention to issues of writing and representation marked a monumental shift that, in chorus with important critiques coming from feminist and native anthropology, transformed the discipline during the final decades of the 20th century. As such, many contemporary anthropologists view Geertz's articulation of thick description as a turning point in repositioning anthropology closer to the humanities.

Torres Straits Expedition

The 1898 Cambridge Anthropological Expedition to the Torres Straits was an important turning point in the development of British anthropology,

establishing fieldwork by trained observers as the central methodology for the nascent discipline. Several of its members played a leading role in the professionalization of anthropology in the United Kingdom and beyond.

The expedition was designed and led by Alfred Cort Haddon, a Cambridge-trained natural scientist, part-time lecturer in comparative anatomy at Cambridge, and professor of zoology at the Royal College of Science in Dublin. Haddon's anthropological interests developed during his 1888 field trip to the Torres Straits to study marine biology. Working closely with Islander assistants, he became fascinated with their culture and was concerned that traditional beliefs and practices were under threat.

Within a paradigm of salvage ethnography, Haddon returned as leader of the 1898 Cambridge Anthropological Expedition to the Torres Straits. The goals and expertise of the expedition members reflected an unprecedented comprehensive vision of anthropology. Haddon researched local customs, physical anthropology, and decorative art and oversaw the collection of artifacts. William Rivers, a medical doctor trained at St. Bartholomew's Hospital and a Cambridge lecturer in the physiology of the sense organs, focused on experimental psychology and physiology with an emphasis on vision. Rivers was assisted by Charles Myers, who had just completed his medical studies at Cambridge, and William McDougall, a physician at Saint Thomas's Hospital in London. Myers, a skillful musician, concentrated on hearing and music, while MacDougall studied tactile sensation. Charles Seligman, a specialist in tropical diseases at Saint Thomas's Hospital, researched native medicine and local pathology. Sydney Ray, a schoolteacher in East London, noted for his self-taught expertise on Oceanic languages, became the expedition's linguist, compiling word lists, constructing grammars, and assisting with translations. Haddon's student, Anthony Wilkin, took photographs under Haddon's direction and investigated house construction and land tenure.

The expedition members brought with them the latest equipment, methods, and skills developed in natural history, laboratory, and medical practice. The testing and recording apparatus included a color wheel, Holmgren's wool test for color blindness, eye charts, Francis Galton's whistle for testing aural perception, the two-point discrimination test for tactile sensitivity, visual perception diagrams, a recording wax cylinder phonograph, a magic lantern projector, two or more cameras, and a cinematograph. The expedition members' perceived ability to record, analyze, and disseminate the results of their research depended crucially on the adaptation of these objects and related techniques to the field.

The research agenda was comparative, with fieldwork divided between Mer in the far-eastern islands and Mabuiag in the western islands. Expedition members also conducted short stints of research in the Central District and Papuan Gulf regions of New Guinea. Following more than 7 months' fieldwork in the Torres Straits, the expedition was extended to Sarawak for 3 months at the invitation of District Resident Charles Hose. They returned to England in April 1899.

With the assistance of Islanders, the expedition's work generated an enormous corpus of information and materials, supplemented by correspondence with Islanders and other specialists for more than 20 years. The results included the six volumes of *The Reports of the Cambridge Anthropological Expedition to Torres Straits* (1901–1935), numerous scholarly and popular publications, a collection of approximately 1,000 artifacts, more than 500 photographs, 400 indigenous drawings, several short sequences of moving film, sound recordings, and genealogical charts. The sources of the expedition's data were acknowledged in the *Reports*, with named Islanders and other informants quoted verbatim.

The expedition's main contributions to anthropology were its methodological advances, consolidated by the "Cambridge school," Haddon, Rivers, Myers, and Seligman, in the 1912 British Association for the Advancement of Science edition of *Notes and Queries in Anthropology*. The expedition marked a clear break between the amateur and antiquarian of the 19th century and the development of the professional anthropologist who would combine field-based observation with theoretical analysis. A central concern was the diversity, complexity, and distribution of "racial" and cultural groups throughout Melanesia, with analysis based on a comparative study of the distribution of physical characteristics, languages, sociocultural traits, and material culture. The 1912 guidelines promoted "the intensive study of limited areas" and outlined how best to collect and record anthropological "facts" for comparative study and analysis. Photography was an essential tool, and the edition included a long appendix on

photographic techniques. A major innovation was Rivers's development of the "genealogical method," originally intended as a means of determining the influence of inherited traits for medical research; it became the basis for kinship studies well into the 20th century. Crucially, the results of the psychophysiological research indicated that the Islanders' capacities were similar to those of British test subjects, including the expedition members. Their claims that variants within a test group were greater than those between different groups demonstrated that there was no evolutionary hierarchy of sensory aptitudes. Ray's farsighted linguistic research included the local version of Pacific Pidgin English as well as a detailed study of the two indigenous languages of the Torres Straits, Meriam Mir and Kala Lagaw Ya. While Pidgin was generally scorned by his contemporaries as inferior English, it was later transformed into the creole Torres Straits Broken, which became the modern lingua franca of the region.

The expedition had a significant impact on the careers of some of its members, and they played leading roles in the institutionalization of anthropology within the United Kingdom and beyond. Haddon was appointed the first university lecturer in ethnology at Cambridge in 1901 and reader in 1909; in 1910, Seligman became the first lecturer and then, in 1913, professor of ethnology at the London School of Economics; and Rivers contributed to anthropological teaching in Cambridge alongside his psychological and physiological work. Haddon continued his Melanesian research throughout his lifetime, conducting fieldwork in the Papuan Gulf in 1914. Rivers developed his work on anthropological method and kinship during his Indian field research with the Todas, noted for their practice of fraternal polyandry. Seligman's coastal survey during the Cook Daniels Expedition to New Guinea in 1904 and Rivers's research through the islands of the New Hebrides and the Solomon Islands aboard the mission ship *The Southern Cross* in 1908 led to major monographs on Melanesian history. Seligman went on to conduct fieldwork in Sri Lanka in 1907–1908; and from 1909, his research with his wife Brenda focused on the Sudan.

Throughout their careers, the veterans of the Torres Straits Expedition energetically advocated for the professionalization of the discipline and its wide-ranging public value. Haddon, Rivers, and Seligman became fellows of the Royal Society; held leading positions in the main British learned societies, such as the Anthropological Institute and the British Association for the Advancement of Science; and published extensively. Along with Henry Balfour and Robert Marett at Oxford, they taught the first generations of professionally trained anthropologists in Britain, who were encouraged to undertake solitary intensive fieldwork and went on to establish a distinctive form of British social anthropology. Their most famous students included Alfred Reginald Radcliffe-Brown, Bronisław Malinowski, Edward Evan Evans-Pritchard, and Gregory Bateson.

The results of the expedition's work remain foundational for scholars working in the region and continue to be of great interest to Torres Straits Islanders. Information from the expedition's *Reports* has been used as crucial legal evidence in the Islanders' struggles for self-determination, leading to the landmark successes of the 1992 Murray Island Land Case, which overturned 200 years of *terra nullius* and marked the first time the Australian government recognized the prior ownership of land by an indigenous group. In 2010, the determination of the Torres Straits Regional Sea Claim established native title over 42,000 square kilometers of sea.

Turner, Victor W.

Victor Witter Turner (1920–1983) was a Scottish-born British anthropologist and an innovative thinker. A prolific contributor to the anthropology

of ritual, symbol, and performance, Turner had a prodigious impact across a spectrum of disciplines from anthropology, religious, and theological studies to cultural, literary, and performance studies.

Life and Work

The son of Captain Norman Turner, an electronics engineer, and Violet Witter, founding member and actress of the Scottish National Theater, Turner was born in Glasgow, Scotland, on May 28, 1920. He studied poetry and classics at University College, London (1938–1941) and, as a conscientious objector, joined a noncombatant bomb disposal unit during World War II. In 1943, he married Edith Turner (with whom he had five children), who eventually became a respected anthropologist in her own right and was, according to Barbara Babcock, the "subjunctive mother" of his work. He completed a BA in social anthropology at University College in 1949, after which he studied for his doctorate under Max Gluckman at Manchester University (completed in 1955). Turner's theory of "social drama," forged in ethnographic research conducted among the Ndembu tribe in Northern Rhodesia (now Zambia), was introduced in his dissertation published as *Schism and Continuity in an African Society* (1957), which gained recognition as a unique entry in political and processual anthropology. After earning his doctorate, Turner became Simon Research Fellow, lecturer, and senior lecturer at Victoria University of Manchester (1957–1963), though he soon cut a path beyond the Manchester school and neo-Marxist analysis. In 1963, he left England with his family to take up a position as professor of anthropology and chairman of the Committee on African Studies at Cornell University in Ithaca, New York (1964–1968), having been previously (1961–1962) appointed a fellow at the Center for Advanced Studies in the Behavioral Sciences at Palo Alto, California. He later took up professorial positions in anthropology at the University of Chicago (1967–1977) and the University of Virginia in Charlottesville, where he was R. Kenan Professor of Anthropology and Religion and a member of the Center for Advanced Studies and the South Asia Program, until his death from a heart attack in 1983 (Turner also served as visiting professor of American studies at the University of Minnesota in 1980).

Turner's influences include, most directly, the process anthropology of Max Gluckman, with Émile Durkheim and Arnold van Gennep, Wilhelm Dilthey, and Mihaly Csikszentmihalyi offering foundations for conceptual innovations on ritual. Turner's ethnographic method—what he called "comparative symbology"—was shaped by the drama theorists Kenneth Burke and Erving Goffman, as well as by a uniquely poetic sensibility. Prospero, Rainer Maria Rilke, Herman Melville, Søren Kierkegaard, and others informed his theories, and he taught Blake and Dante alongside anthropological theory. A tireless interdisciplinarian and iconoclast, Turner was instrumental in the formation of the field of ritual studies. While carrying forward the Durkheimian understanding of "ritual" as an efficacious socio-religious phenomenon serving to transfer individuals/groups from the "profane" to the "sacred," Turner understood symbols, ritual, and indeed religion as processes in which individuals and collectivities were wholly engaged—where symbols possess ontological value.

While the literary and dramatic arts provided fertile conceptual material for Turner, he promoted anthropological models of ritual to assist comprehension of theater and other performance genres. This dialogue was critical to the formation of performance studies under the guidance of the performance theorist and experimental theater practitioner Richard Schechner, who was especially influenced by Turner's approach to ritual and performance. Turner's approach is outlined in numerous research articles and anthologies of essays and lectures, including those (re)published posthumously by Schechner in 1987 in *The Anthropology of Performance* and by Edith Turner in *On the Edge of the Bush: Anthropology as Experience* (1985) and *Blazing the Trail: Way Marks in the Exploration of Symbols* (1992). In particular, the article "Are There Universals of Performance in Myth, Ritual, and Drama?" offers a rare condensation of Turner's ideas on ritual and performance.

From his earliest and most memorable work on Ndembu ritual to later investigations of performance genres in postindustrial society, Turner pursued a processional understanding of society and culture. From cultic symbols to theater and leisure genres, the chief objective was to understand the ways in which symbolic units, social "fields," and aesthetic genres condense, evoke, and channel

meaning and emotion. While diverse in its scope, the entire corpus of Turner's work illustrates a fascination with the way sociocultural "structures" are re/produced—the formed, the performed. And rather than pursue structural-functionalist or depth psychological analyses of such processes, Turner proposed an "anthropology of experience" (with Edward Bruner). In this approach, meaning would be found in temporalized "structures of experience" (the *Erlibnise* of the German philosopher Wilhem Dilthey) rather than formal categories of thought, such as the "dualistic rigor mortis" of Lévi-Strauss's structuralism.

Ndembu Ritual Symbolism

Turner gained a reputation through his early immersion in the social and semantic complexity of rituals, largely through his ethnography of the Ndembu. His path-breaking analysis of the sensory and ideological character of symbols in his 1967 essay "Symbols in Ndembu Ritual" is a primary example of this process and led to a better understanding of how rituals are effective and transformative. This and other essays published in *A Forest of Symbols* (1967) clarified the method of analysis. Turner identified seasonal and contingent ritual, with the latter including "life crisis" rituals and "rituals of affliction." Symbols in these rituals were identified to possess several attributes: *multivocality or polysemy* (possessing multiple referents), *unification of apparently disparate significata* (disparate, even contradictory meanings are interconnected by analogy or by association), and *polarization of significata* (symbols possess two poles of meaning: the ideological and sensory). Turner also sought to understand the various properties (i.e., manifest, latent, and hidden meanings) of symbols—the observation of which demonstrated influence from Freud's *The Interpretation of Dreams*—and approached the study of symbols employing three "analytical frames": (1) *exegetical*, where meaning is supplied by those inside the ritual system; (2) *operational*, where meaning is derived from the use made of the symbol; and (3) *positional*, where meaning derives from the relationship of the symbol to other symbols in the total ritual system. Essays found in *The Forest of Symbols*, such as "*Mukanda:* The Rite of Circumcision" and "*Muchona*, the Hornet" are richly detailed analyses of the complex symbolic life among the Ndembu. Another essay in that volume, "Color Classification in Ndembu Ritual: A Problem in Primitive Classification," introduced the black-white-red triad fundamental to the semiotics of color and the pattern of color mediations that came to be known as "the Turner effect."

In the 1960s, Turner earned world renown as a symbolic anthropologist. Perhaps his greatest achievement remains the early monograph *Chihamba, the White Spirit: A Ritual Drama of the Ndembu*. Originally published in 1962 (and republished in 1975), this classic analysis of the symbolic significance of the "ritual of affliction," *Chihamba*, offers, with assistance from the likes of Melville's *Moby Dick*, Turner's key theological statement on religion and the beginnings of his "comparative symbology." Providing further evidence of Turner's method, *The Drums of Affliction* (1968) analyzed divination, rituals of affliction, and female initiation ritual in terms of the wider field of social and kinship relations, demonstrating Turner's ongoing interest in the total political field in which individual actors are implicated.

Liminality, Drama, and Redress

As outlined in essays in *The Ritual Process* (1969) and *Dramas, Fields and Metaphors* (1974), society is the product of the dialectical historical relationship between "structure" (society's status and role differentiation, behavioral norms, and cognitive rules) and "antistructure" (those regions of experience in culture—outside, in between, and below structure). In this dialectic, "fixed" and "floating worlds" correspond with "indicative" and "subjunctive moods." This dramatic scheme reveals a structural processualism, with such "worlds" or "moods" deemed to be necessary sources of *resolution* (or redress). The explorations in later work blazed trails across the margins and vital thresholds of dissolution where cultural order is said to be re/constituted. These moments were "liminal," a term rooted in the Latin *limen* ("threshold"), used by Arnold van Gennep to describe the central phase in his tripartite (separation, transition, and reincorporation) rites-of-passage model, and richly outlined in Turner's 1967 essay "Betwixt and Between: The Liminal Period in *Rites de Passage*."

Liminality, a universal condition of growth and potential novelty in which individuals, societies, and

cultures are periodically implicated, would become the leitmotif in Turner's philosophy. Significantly, liminal conditions are both provisional of a cultural means of generating variability and facilitate the continuity of proved values and norms. Thus, the limen would be a protostructural vehicle of cultural re/creation. Since liminality is essentially an arena of recombinant indeterminacy, "a storehouse of possibility," it was understood to be "the realm of primitive hypothesis." Turner's career became an exercise in enunciating and unpacking this realm, elaborating on the limen's diverse manifestations and implications for diverse audiences, among them psychologists and neurobiologists. Later in his life, Turner strove to include studies of the brain in a holistic approach to culture. In his 1985 essay "The New Neurosociology," he passed conjecture on the dramatic—and evolutionary—significance of tensions between the brain's hemispheres.

Throughout his life, then, Turner identified the "form" of social process as agonistic or "dramatic." Based on his research on the role of ritual in Ndembu conflict resolution and in affliction cults, Turner argued that the redressive nature of such social processes found cultural form in the spectrum of performance genres (or "cultural dramas"). And these performances—from rites and festivals to sports events, theater, film, and television, and indeed literature—in turn provide fuel for renewed social drama. Life and art would imitate each other according to a perpetual cultural feedback mechanism. Like Gregory Bateson's "ritual frames" or Clifford Geertz's "metasocial commentaries," Turner argued that social performances facilitated collective inquiry into the historical and daily exigencies and contradictions of social existence. For Turner, variant fields of performance from tribal ritual to global leisure genres demonstrate the perennial reliance of culture on frameworks of meaningful action where subjects may become the object of their own awareness. Performances may then themselves be "designs for living" and active agencies of change. They may also be contexts in which tradition is installed in a community of believers, creating what Turner called "communitas," as is the case with pilgrimage, to which the Turners, as practicing Catholics, devoted considerable attention in the 1970s.

Turner embraced a "comparative symbology" involving interdisciplinary analyses of traditional ritual and the emergent symbolic genres of postindustrial societies, as evidenced by the essays in *From Ritual to Theatre: The Human Seriousness of Play* (1982). In this endeavor, "liminality" itself underwent a conceptual transition, one aptly characterized by uncertainty. While the concept had been applied to illuminate the central phases of transition rites common to small-scale and agrarian societies, gazing on the "floating worlds" of industrial and predominantly capitalist societies with a complex social and economic division of labor, Turner detected the presence of "quasi-liminal," or "liminoid," elements in performance. While liminal cultural phenomena reveal the collective, integrated, and obligatory ritual action of premodernity, shaped by new media technologies, rationalization, and bureaucracy, liminoid leisure genres are voluntary, plural, fragmentary, and experimental.

Turner's liminal/liminoid distinction, was provocative and insightful, albeit speculative and contradictory. These somewhat confusing categories are illustrative of the legacy of Durkheim and the complex fate of the sacred in modernity. On occasion, Turner appears to have recognized the loss, or attenuation, and at other times, the resilience, or rebirth, of *the sacred* as expressed in ritual form. In the former narrative, the decline of ritual, or "deliminalization," is the tragic consequence of secularization. In modern times, where societies have grown in scale and complexity, as the division of labor has increased and as work and leisure spheres became more clearly demarcated, ritual's power and potential for transformation is said to have been denuded. It is largely the perceived shift from collective, obligatory social bonds—as seen in rites of passage—to individual voluntary association that has foreshadowed and accompanied the emergence of aesthetic, fragmentary, and liminoid genres. However, Turner was also keen, especially in later writing, to demonstrate that the symbolic action of premodernity could be observed in his time—albeit through a miasmic ensemble of magnifying and distorting lenses such as film and sports events. But not only was liminal ritual residual, strong pockets of revival were detected in the liminoid genres (especially the new theater, to which the Turners themselves were committed). In this project, the tragic *decline* of ritual (the sacred) remains a key intellectual investment, forming the necessary background to its *resurgence* in performance genres. For Turner, the depiction of modern secularization became a

strategic narrative—a condition out of which the sacred (the authentic liminal) was rediscovered or relived. While modern history appeared to be the stage for an epic drama of the kind where performance itself was performing tragic and heroic roles, in Turner's ontohistorical melodrama, in one way or another—in fragmented and/or resurgent forms—the sacred lingered.

The problem with this historical perspective (from liminal to liminoid) is that by comparing contemporary ritual performance with genuine and presumably premodern "liminal" actions, of which they may represent a remnant, contemporary symbolism may be deprived of significance, "religious" or otherwise. This circumstance has required rethinking in light of the development of digital, virtual, and communication technologies and of new spiritualities and alternative religions. As global media technologies (from satellites and mobile/smart phones to virtual digital media) have transformed the lives of global populations, enabling and enhancing immediacy, social spontaneity, and belonging across distances, new models have been sought. Contemporary cultural theorists have indeed jettisoned the liminal/liminoid distinction. Inspired by Turner, Michel Foucault, and Gilles Deleuze and Félix Guattari, in *Perform or Else: From Discipline to Performance* (2001), Jon McKenzie reconfigures liminality in the digital age. Within this perspective, the work/play and labor/leisure distinctions are recognized to have dissolved. McKenzie's work also addresses the imperative power of the liminal and thereby attempts to correct the tendency within American performance studies whereby the conflation of liminality with resistance or liberation led to its representation as that discipline's "metamodel" of cultural performance, at the expense of research into the ways individuals and societies are disciplined. Attention to the ways rituals—from ceremonies of state to cinema—control or manage hegemonic, patriarchal, or disciplinary power returns us to the re/creation pivotal to Turner's thesis.

Legacy and Contemporary Relevance

Turner was a cultural theorist occupying an ambiguous place between modern and postmodern thought. The work the Turners performed among the Ndembu remains landmark ethnography, but his later work with the semiotic, subjunctive, and reflexive characteristics peculiar to ritual, festival, theater, and narrative genres helped shape the fields of performance studies and literary criticism. Furthermore, his contention that religion has moved into the leisure sphere attracted students of religion, tourism, popular culture, and media.

Scrutiny of Turner's work not long after his death demonstrated his critics' mistrust of transcendental principles and universal absolutes. But while the utopian concept of "communitas" attracted controversy and the resolutionary process implicit in "social drama" contrasts with instances where rituals fail or become illogical, or where meaning remains elusive, observers have returned to Turner to retrain the anthropological gaze on, for instance, the office workplace, family therapy, rave and other dance cultures, queer cultures, tourism behavior, and emergency structures arising in the wake of natural disasters. And with varying faithfulness to or comprehension of the intended logic, researchers have located an almost ephemeral liminality: in sex, illness, consulting activity, narrative genres, media events, and sites of media production; in consumption behavior and shopping malls; in transpersonal states of consciousness; in "cyborg" subjectivities; and in the cybercommunication of digitally virtual spaces. It is also apparent that, in the United States and elsewhere, new ritual practitioners have adopted the conceptual architecture provided by Turnerian universalisms to legitimate their own ritualized inventions.

Tyler, Stephen A.

Stephen A. Tyler (1932–), the American anthropologist, linguist, and rhetorician, is among the most important figures of contemporary American anthropology.

Biography and Major Works

Tyler was born in Hartford, Iowa. He is married to Martha G. Tyler and has a daughter, Alison Elisabeth Tyler. After serving in the Air Force during the Korean War, Tyler enrolled at Simpson College and later received his master's and doctorate degrees from Stanford University. His early influences came from Asian studies and the culture and personality approaches of the anthropologists Douglas Haring, Ruth Benedict, and Gregory Bateson. He taught at the University of California, Davis; University of California, Berkeley; and Tulane University. In 1970, he joined the faculty at Rice University and later held the Herbert S. Autrey endowed chair in anthropology and linguistics. He retired in 2011.

Tyler conducted fieldwork among the Koyas of India. This work is detailed in *India: An Anthropological Perspective* (1973) and *Koya: An Outline Grammar* (1969). The former is an ethnological overview of the people and cultures of India and the latter an extensive descriptive linguistic study of the Koya (Gommu dialect). During this period, he also undertook a formal study of kinship, with emphasis on the Koya and Dravidian kinship systems. Tyler was a participant in the School of American Research seminar that led to the publication of *Writing Culture* (Clifford & Marcus, 1986), and he was famously pictured on the cover of the same text in an image from his 1963 fieldwork among the Koya.

In 1969, Tyler edited *Cognitive Anthropology*—a collection that would become one of the definitive texts of the field called cognitive anthropology that Tyler helped to popularize. His book *The Said and the Unsaid: Mind, Meaning, and Culture* (1978) challenged formalist approaches to language and argued for linguistic and hermeneutical understandings that emphasized the context of language. His most influential work is *The Unspeakable: Discourse, Dialogue, and Rhetoric in the Postmodern World* (1987)—a text that established a theoretical foundation for notions of postmodern anthropology. Tyler also was associate editor of *The Annual Review of Anthropology* (1973–1992), associate editor of *American Ethnologist* (1973–1976), associate editor of *Journal of Anthropological Research* (1981–2010), associate editor of *Cultural Anthropology* (1984–1993), and editor (with Ivo Strecker) of Volumes 2 and 3 of *Rhetoric and Culture*. He has published widely in numerous journals on topics including ethnographic method, kinship, rhetorical theory, and linguistics.

Critical Contributions to Anthropology

Tyler's contributions to anthropology are significant and especially relevant in popularizing the subfield of cognitive anthropology and, much later, stimulating the critical, sometimes called postmodern, wing of contemporary anthropology.

Cognitive Anthropology

In 1969, Stephen A. Tyler edited the collection *Cognitive Anthropology* and helped popularize the influential theoretical approach known as cognitive anthropology. This collection offered a sampling of the various methods of the approach—folk typologies, ethnosemantics, formal analysis, componential analysis, ethnoscience, and sociolinguistics—and suggested a new trajectory for achieving the emic, or insider's, view of culture. Tyler argued in the book's introduction that anthropologists until then had been more concerned with the culture of anthropology than with the actual cultures that were being studied. Cognitive anthropology sought to understand how people conceptualize their own cultures by focusing on the organizing principles that underlie behavior and reside in the mind. Tyler encouraged anthropologists to ask what phenomena are important for people of a particular culture and how these people organize these phenomena. Cognitive anthropology offered substantial reworkings of the concepts of culture and ethnography, and its methods were distinctive for their formal scientific use of mathematics and logic.

Critique of Cognitive Anthropology

In a manner appropriate to a good postmodernist, Stephen A. Tyler helped found a school of anthropological thought—cognitive anthropology—that he subsequently, many years later, helped to critique and partially dismantle. Following a close reading of Ludwig Wittgenstein's *Philosophical Investigations* (1953), Tyler discovered major flaws in many of the fundamental principles of cognitive anthropology. Ultimately, he felt that the cognitive anthropology movement had become too concerned with a one-dimensional, referential notion of language that discounted the many complexities of language and culture. Tyler also posited that cognitive anthropology had become narrow, specialized, and focused solely on lexical fields and, over time, had become co-opted by cognitive studies.

Hermeneutics, Linguistics, and Rhetoric

As a linguistic anthropologist, Tyler published important work on Dravidian language and in the philosophical aspects of language and rhetoric. Many of his philosophical ideas in this area—including the middle voice (in which the subject is neither the agent nor the acted on, instead the subject actively and reflexively acts on itself), the idea of pictorial and performative communication, the critique of realist means of communication, and the idea of parody as a critical and textual device—have influenced the contemporary understandings of anthropological fieldwork and textuality. His explicit attention to issues of discourse, interpretation, and representation provided important innovation in the discussions of ethnography associated with *Writing Culture*.

Thought Picture

A common element in Tyler's teaching and, especially his academic publications, is the use of what he called the *thought picture*. For Tyler, the thought picture represents a critical yet playful use of what could be called traditionally a diagram or illustration. He has stated that the use of the thought picture serves two vital purposes. One is to offer a critique of the prevalence of the visual as the primary mode of representation and understanding in Western thought. The second is to suggest a form of writing that takes seriously the idea of the picture. In his 1995 essay "Prolegomena to the Next Linguistics," Tyler argues for an approach to language that moves away from alphabetic writing to picto writing (the hierogram, rebus, etc.). For Tyler, the thought picture is a mechanism that has both methodological and epistemological purposes.

Postmodern Ethnography and Evocation

Tyler's criticisms of Western scientific methods and modernist discourse resulted in one of the most significant concepts of contemporary postmodern anthropology—evocation. His notion of evocation draws on the Latin root "voc-" which means to voice, speak out, or speak for. According to Tyler, the foundation of evocation is not trying to get a reader to do something, not trying to describe something, and not making claims about knowing something. Instead, evocation hinges on the idea of moving ethnography beyond representation. Evocation

is foundational to one of Tyler's most provocative contributions to contemporary anthropology—his notion of postmodern ethnography. The foundations of his ideas appeared first in Tyler's essay "Post-Modern Ethnography: From Document of the Occult to Occult Document" in *Writing Culture*. Of the many chapters that appeared in the monumentally influential *Writing Culture*, only Tyler's suggested a practical and applicable future for postmodern ethnography. In fact, he has suggested that many of the texts that have purported to be postmodern in their approaches are only simple reworkings of modernist ethnography that retain a modernist orientation. According to Tyler, a postmodern ethnography is a cooperative document that contains fragments of speech and discourse that aim to create an evocative and therapeutic effect in the mind of the reader. Tyler has not specified specific exemplars of postmodern ethnography, but he has argued for a number of qualities that would move ethnography in a postmodern direction. These include a crosscutting of textual genres (including a merging of forms of scientific writing with forms of poetic writing); the use of nonlinear textual forms (including electronic means); the advocacy of pictorial writing, the use of the middle voice; explicit attention to the audience of ethnographic texts; the development of reflexivity and self-conscious textual forms, cooperative texts, countertexts with critical responses, polyphonic texts, and fragmentary writing approaches; an emergent holism; and restorations of the commonsense world. While these ideas are fragmentary, they are inspirational in terms of the current (and future) impacts on ethnography. As Tyler said in his 1987 book *The Unspeakable: Discourse, Dialogue, and Rhetoric in the Postmodern World*, postmodern ethnography is a vehicle of mediation, not a map of knowledge.

Tyler's Legacy

Tyler's work has offered profound and provocative inspirations for cultural anthropology. Tyler is among a small group of anthropologists who have inspired changes within the discipline that range from the extremes of scientific method to humanistic and aesthetic postmodernism. Tyler's critics have been many. Many of the reviews of his influential "Post-Modern Ethnography: From Document of the Occult to Occult Document," for example, have focused on his appeal to poetics, his denial of an explicit political voice for ethnography, his linguistic and theoretical complexity, and his rejection of the many foundations of modernist ethnography. To these critics, Tyler has envisioned a postmodern approach to ethnography and anthropology that necessitates the rejection of the classical methodological and representational approaches of the discipline and the adoption of entirely new and disturbing approaches. Especially for students new to the discipline and to graduate students in search of a provocative stimulus for their ethnographic projects, Tyler's work will perhaps have the most lasting influence.

Tylor, Edward Burnett

Sir Edward Burnett (E. B.) Tylor (1832–1917) is widely considered to be among the founders of anthropology.

Brief Biography

Tylor was the fifth child and third son of Harriet Skipper and Joseph Tylor. His parents were well-off industrialists, the owners of a brass foundry in London and coal mines in the Rhondda valley of Wales. The Tylors were members of The Society of Friends (Quakers), and since, at that time, attending Oxford or Cambridge required a student to sign the "thirty-nine articles" of faith of the Anglican Church, education at these institutions was not available to them or their children. Instead, Tylor attended Grove House, a Quaker boarding school in London (Tottenham). At the age of 16, Tylor apprenticed in his father's brass factory, which was managed by his older brother Alfred. Alfred, 10 years older than Edward and also educated at Grove, became a noted geologist. Elected a fellow of the Geological Society, in 1851, Alfred Tylor was a juror at the Crystal Palace exhibition, where copper coal scoops produced by the family firm were also displayed. George Stocking speculates that E. B. Tylor's interests in both progressive evolutionary change and the wide variety of human societies may well have been stimulated by his attendance at this exhibition.

Tylor worked in the family business for only 6 years. In 1854, he was diagnosed with tuberculosis and sent to the southern United States to recuperate. In 1856, in far better health, he traveled to Havana, Cuba, where by chance he met Henry Christy, a wealthy fellow Quaker, who was Tylor's senior by more than 20 years. Christy was interested in archaeology, hunter-gatherer societies, and amassing collections of ethnographic artifacts. Christy had traveled to southwest Asia, Scandinavia, and the Americas building his collections, and he now invited Tylor to join him on a 4-month tour of Mexico. This trip formed the basis for Tylor's first book, *Anahuac: or Mexico and the Mexicans, Ancient and Modern* (1861). Tylor's association with Christy continued until the latter's death in 1865, and it was important as Christy was involved in critical archaeological discoveries in Europe in the 1860s, particularly in the caves in the Dordogne, in southern France.

Returning to England, he married Anna Fox in 1858. Support from his older brother, who was by now extremely wealthy, allowed Tylor to devote himself to his interest in the development of human society and the progress of civilization. This resulted in the 1865 publication of *Researches Into the Early History of Mankind and the Development of Civilization* and, in 1871, *Primitive Culture: Researches Into the Development of Mythology, Philosophy, Religion, Language, Art and Custom*. *Primitive Culture* is generally considered Tylor's most important work.

Tylor's scholarship was well received, and in 1871, he was elected a fellow of the Royal Society. Oxford University awarded him an honorary doctorate in 1875 and appointed him keeper of the University Museum in 1883. He was appointed a reader in anthropology in 1884 and became the first person to hold a professorial chair in anthropology at Oxford in 1896.

Through much of this era, Tylor remained extremely active. He investigated spiritualists around London in 1872 and traveled again to the United States in 1884. He published an introductory textbook, *Anthropology: An Introduction to the Study of Man and Civilization*, in 1881, as well as numerous journal articles on diverse topics including marriage customs, religion, Native American games, and Tasmanian stone implements. Tylor was also the most important voice on the British Association for the Advancement of Science committee that, in 1874, produced *Notes and Queries on Anthropology*, a work designed to allow researchers as well as colonial administrators, missionaries, and travelers to collect ethnographic data. *Notes and Queries* was widely used over the next half-century, and this was one factor that gave Tylor's ideas far-reaching impact. Between 1889 and 1891, Tylor also gave the prestigious Gifford Lectures in Aberdeen; however, though he worked at preparing these for publication for a decade, they never appeared in published form.

Tylor retired in 1909, and though he was knighted in 1912, he was largely inactive. He seems to have

been increasingly ill and perhaps confused (sources speak of failing mental capacities). He died in 1917 and was survived by his wife of almost 60 years. They had no children.

Tylor's Contributions

The remainder of this entry examines several aspects of Tylor's work. It begins with a discussion of Tylor's understanding of evolution and continues with sections on psychic unity, comparative method, and survivals; animism and the evolution of religion; Tylor's definition of culture; Tylor and fieldwork; and critiques of Tylor. It concludes with a brief assessment of Tylor's contribution to anthropology and his idea of anthropology as a "reformer's science."

Tylor and Evolution

George Stocking has noted that issues concerning the nature and antiquity of humanity were central intellectual concerns in Europe in the 1860s. Although ideas of human progress had played a strong role in European intellectual currents since the mid-18th century, the older notion of degenerationism was still strong. Degenerationists held that the variety of human societies was explained by differential historical degeneration from a more perfect state. The publication of *On the Origin of Species* not only raised the profile of the debate between degenerationists and progressivists but also revived the possibility of polygenesis, the idea that different groups of humanity had different biological origins. In this intellectual context, Tylor stood as a firm supporter of monogenesis and progressivism. The first of these may well have been inspired by his humanitarian and Quaker background, particularly the Quaker notion that "there is that of God in every person." The second seems to have had numerous sources, including his reading of German social evolutionism, his friendship with Christy, also an ardent progressivist, and his understanding of new archaeological discoveries. Tylor's social milieu probably played a key role as well: As the scion of a family that was involved in industry and had become wealthy within the past two generations, Tylor was probably predisposed to believe in progress. Many supporters of degenerationism came from the aristocracy or clergy, or sometimes both.

Tylor's ideas of evolution should be clearly distinguished from Darwin's. In the preface to the second edition of *Primitive Culture*, Tylor claims that his ideas were developed without reference to Darwin, and there is no reason to doubt him. While Darwinian evolution is based around competition and reproductive success, these elements are almost totally lacking in Tylor's work. Instead, Tylor follows Auguste Comte and other progressivist philosophers in seeing evolution as the sum result of human intellectual experiences. These drive humanity through a series of fixed states to ever greater degrees of rationality. Tylor argued that humanity had begun in a state of primitive savagery and progressed to civilization. Although Tylor believed that his own society was the most highly evolved and most civilized of its day, he thought that it still contained many irrational elements that progress would eventually eliminate.

Psychic Unity, Comparative Method, and Survivals

Tylor's belief in monogenism meant that he believed that all human brains followed the same course of development, an idea often referred to as psychic unity. Tylor, following the thinking of the German ethnologist Adolf Bastian, believed that the widespread presence of similar material artifacts in diverse areas of the world proved the uniform nature of human thinking. He argued that all humans would solve in similar ways the problems their societies and environments presented to them. Each new social order presented problems that had to be solved with increasing rationality. Differences between societies resulted from the fact that some societies had progressed farther along this pathway than other societies. However, the fact that humanity was a single species and that human thinking ran along predictable pathways meant that all societies would follow the same course of progress. Thus, for Tylor and other scholars of his era, such as Lewis Henry Morgan, psychic unity was based in biology but tied to the idea that humanity had to follow a single course of progressive social development.

Given Tylor's belief in psychic unity and evolutionary progress, the general goal of anthropology seemed clear: Using examples from currently existing societies as well as those recorded in the literature, particularly ancient texts, anthropologists should strive to show examples of every stage of human development. The comparative method was the key tool for doing this. The traits and characteristics of

societies could be compared with one another to determine where each fit on the evolutionary scale. A clear path from savagery to civilization could then be delineated. Note that the comparative method is different from simply comparing one society with another; it assumes a single path of progress followed by all societies and ranks societies as more or less evolved depending on their position relative to one another. In this view, indigenous societies were considered to be living fossils. They were examples of earlier stages of social evolution.

Tracing the history of social customs was critical to reconstructing the evolutionary pathways of humanity. Tylor recognized the importance of diffusion, famously writing that "civilization is a plant much oftener propagated than developed"; however, independent invention and inheritance were far more critical to his argument. Although he focused on diffusion in *Researches into the Early History of Mankind* and in some later work, *Primitive Culture* emphasized both independent invention and the doctrine of survivals.

The notion of survivals is particularly critical to Tylor's methodology. A "survival" is a material trait or a social custom existing in a society that had no clear, logical use and necessity within that society. For example, in *Anthropology* (1881), Tylor describes the ways in which the specific styles of the formal fashions of his day had practical origins, largely in the demands of horsemanship. He writes that the formal evening dress coat had its origins in "the old-fashioned practical coat in which a man rode and worked." For Tylor, such customs were relics of earlier stages of society. On the one hand, since they were irrational, they would eventually evolve out of society, but on the other, they provided information about the society's earlier stages and could be a key tool in reconstructing its evolutionary history and in determining its place in the evolutionary hierarchy.

Animism and the Evolution of Religion

Much of *Primitive Culture*, including the final third of Volume 1 and all of Volume 2, is devoted to a discussion of mythology, animism, and religious ritual. Tylor defines animism as "the general belief in spiritual beings" and refers to it as the "groundwork of the Philosophy of Religion." It is the most basic form of religion. According to Tylor, animism has two elements: (1) the continued existence of the individual soul after death and (2) the existence of spiritual beings, who affect or control events in the world. Tylor proposes that these beliefs probably came into existence for practical intellectual reasons: Primitive people invented them to provide a reasonable explanation of death and of dreams. Thus, he understood this element of religious belief as a kind of primitive science.

Tylor argued that as human rationality progressed, religion moved from the animistic belief in spirits of the dead and of inanimate objects to polytheistic belief and then to monotheistic belief. The progress of religion thus moved along with the general progress of humanity: Animistic belief in spirits of the dead and spirits of inanimate objects was associated with the most primitive societies, more advanced societies were associated with polytheism, and the most advanced societies practiced monotheism.

Ultimately, for Tylor, human progress would take the form of more materialistic and dependable ways of explaining the world as scientific observation and thinking developed. Consequently, religion would increasingly become a system of morals rather than a method of explanation. Although Tylor believed that his own society had made strong advances in this direction, he was also stridently anticlerical and believed that much of the religion of his era, particularly Catholicism, had not yet made the transition from irrational explanation and ritual to rational morality. This is evident in his critique of Spanish and Catholic actions in Mexico in *Anahuac*. It may not be incidental in this regard that the Quakerism of Tylor's own religious background had very minimal ritual elements.

Tylor's Definition of Culture

One of the most famous aspects of Tylor's work is his definition of culture as "that complex whole which includes knowledge, belief, art, morals, law, custom, and any other capabilities and habits acquired by man as a member of society" (1920, p. 1). Particularly, in the first half of the 20th century, American anthropologists saw this idea as similar to their own understanding of culture as a holistic pattern including all material possessions, behaviors, and ways of thought. However, as Stocking has pointed out, Tylor's meaning was different from

that of American, and indeed virtually all modern, anthropologists. Tylor saw culture as a universal possession of humanity. There was a single human culture. Different societies simply possessed more or less of it (or were positioned differently with regard to it). Thus, for example, Victorian Englishmen had the same culture as Australian Aborigines; they just had a different piece of it and very much more of it. This understanding of culture is consistent with Tylor's belief in psychic unity and comparative method as well as the use of survivals (in fact, it is a strong implication of them).

Tylor and Fieldwork

Although Tylor did travel to the United States and Mexico and visited archaeological excavations and sites in France, he is best known as an "armchair anthropologist." This is accurate, since almost all the sources he used in his work were based on existing ethnographic reports and classic European literature. However, Tylor encouraged the fieldwork of others and guided the content of that fieldwork through his central role in the publication of *Notes and Queries* in 1874 as well as several other guides to collecting ethnographic information. *Notes and Queries* formalized and expanded on earlier questionnaires developed by the British Association for the Advancement of Science. Contributors included Augustus Henry Lane-Fox (later Pitt Rivers), Francis Galton, and John Lubbock, though Tylor's contribution was larger than these others. James Urry notes that Tylor not only wrote questions but also provided specific instructions on how they should be asked, as well as advice on objectivity. The questions also tended to reflect Tylor's research interests. Urry notes that there are 49 questions on "social relations" but almost 250 on religion. Tylor was chairman of the committee that wrote the second edition of *Notes and Queries* in 1892 and the third edition in 1899, and he again contributed heavily to these editions. However, when the fourth edition came out in 1912, Tylor's contribution was very much diminished.

Critiques of Tylor

Although Tylor was widely revered within the anthropological community, as his small contribution to *Notes and Queries* of 1912 shows, even within his lifetime, his ideas and style of anthropology were succeeded by other approaches. Several critical problems marred his work. First, as Franz Boas and his students repeatedly noted, Tylor and other evolutionary anthropologists, particularly Morgan, took cultural traits out of context as they built their evolutionary model. Therefore, although they could place societies on an evolutionary scale, they could not show that the development of these societies had followed the same evolutionary pathways. It was an assumption only and, given their style of argumentation, one that could not be proven. Second, Tylor had a difficult time distinguishing between cultural traits that were the result of a society's independent historical development and those that were the result of borrowing or the fact that two societies might have a common origin. This critique, first voiced by Francis Galton in 1888, has become known as "Galton's Problem" and is also found in current-day opinion polling and survey research (though various statistical solutions minimize its effect). Third, Tylor's reasoning often seems tautological. For example, in the first chapter of *Primitive Culture*, Tylor argues that the pathways of human social evolution are so well established that he is able to determine the accuracy of ethnographic reporting. If the reported traits do not fit the known patterns of evolution, then the reporting must be in error. Of course, such filtering of the data can only result in confirmation of Tylor's theory. This problem was particularly egregious because it undermined the use of survivals, which was key to Tylor's method. Tylor often saw cultural traits as both survivals of earlier forms of society (e.g., matrilineality, which he believed to precede patrilineality) and confirmation of the existence of these forms, again assuming what he set out to prove. For these and other reasons, by the early 20th century, almost all anthropologists had abandoned research on demonstrating a single evolutionary sequence for humanity.

Tylor's Legacy: A "Reformer's Science"

Although Tylor's understanding of anthropology and his research methods are not shared by current-day anthropologists, he was critical to shaping the emerging discipline. His intellectual and organizational talents began the institutionalization of anthropology in Great Britain. His promotion of fieldwork and of younger scholars ensured its future. His books were essential reading for anthropology students for

much of the half-century following the publication of *Primitive Culture*. His work on religion acted as a spur to scholars such as William Robertson-Smith, Robert R. Marett, James G. Frazer, and many others.

Reading Tylor today can be difficult. His evolutionary perspective and his certainty that his own society was the most advanced of its era make his work ethnocentric, even racist to the modern reader. However, born in 1832, Tylor was certainly not a modern person. Within his own context, he was a humanitarian and believed that, ultimately, all humans were equal. He concludes *Primitive Culture* by calling anthropology a "reformer's science." However, here too, his interests were different from those of current-day anthropologists. Current-day reformers may be concerned with oppression and social justice. For Tylor, reform meant finding irrational practices and superstitions and "mark[ing] these out for destruction."

U

University of California, Berkeley

The University of California at Berkeley is home to one of the world's most important anthropological programs. The Department of Anthropology and the Hearst Museum, both located in Kroeber Hall, are the core; additional facilities also serve archaeology, physical anthropology, and linguistics. The faculty has garnered national and international recognition for their innovative research, while producing BA and PhD students who have gone on to make important careers in academia, government, nongovernmental organizations, and the private sector.

Early History

Founded in 1901 by the University's Board of Regents, the department and museum were created in response to archaeological and ethnological activities funded by Mrs. Phoebe Apperson Hearst, wealthy patron of the arts and member of the Regents. The department and museum were initially directed by an executive committee, chaired by Frederick Putnam, who became head in 1903. The field staff consisted of the geologist John Merriam, the archaeologists George Reisner and Max Uhle, and the ethnohistorian Zelia Nuttall. In addition, two instructors—Alfred Kroeber (PhD, Columbia, 1901) and Pliny Goddard (PhD in linguistics, Berkeley, 1904)—did fieldwork among California Indians, the most famous of whom was known as Ishi. During the first decade, a treasure trove of artifacts overwhelmed the storage space at Berkeley, requiring their removal to San Francisco.

The teaching program trained professionals while providing undergraduates with general knowledge. Kroeber taught courses such as General Introduction to Anthropology, North American Ethnology, North American Languages and North American Archaeology and conducted seminars on ethnology and languages. Goddard offered courses such as Experimental Phonetics, the Athapascans of the Pacific Coast, and Religions of Non-Literary Peoples.

The first dissertation, *Pomo Indian Basketry*, was accepted, and the PhD was awarded in 1908 to Samuel Barrett. The second PhD followed in 1911, for *The Ethnology of the Salinan Indians* by John Mason. Following Putnam's retirement in 1909, Kroeber took charge. One of his early acts was to bring the independent department of linguistics (founded in 1901) into anthropology, where it remained until 1953.

Anthropology Between the Wars

Trained by Franz Boas, Kroeber was well prepared to develop a department and a museum. Growth required additional faculty. Robert H. Lowie—also a student of Boas—joined the faculty in 1921. For years, he and Kroeber shared the main teaching and graduate-training responsibilities, with the assistance of Edward W. Gifford and Ronald L. Olson (PhD, Berkeley, 1929). Their success led Kroeber to publish his *Anthropology* textbook in 1923, followed in 1924 by the *Sourcebook for Anthropology* (with T. T. Waterman).

While teaching undergraduates, Kroeber, Lowie, Gifford, and their colleagues continued their research and graduate programs. The department's third dissertation did not appear until 1926, when William Duncan Strong submitted *Analysis of Aboriginal Society in the Southwestern United States*. Subsequently, there was steady doctoral production; through the 1930s, more than 20 had been produced, all but 3—Charles Voegelin on linguistics (1932), Waldo Wedel on archaeology (1936), and Theodore McCown on physical anthropology (1939)—dealing with aboriginal populations or comparative cultural analysis. The graduates of the Berkeley program before 1940 included Julian Steward, Ralph Beals, Isabel Kelly, Laura Thompson, Cora DuBois, Harold Driver, Margaret Lantis, Homer Barnett, and Omer Stewart. Several worked in the Great Basin and the Southwest on Kroeber's "culture element survey," which reflected the departmental emphasis on ethnographic fieldwork and comparisons.

Thus, during the 1920s and 1930s, anthropology became well established on the Berkeley campus. The museum and its collections were moved back to the campus in 1931, even though there was no space for public exhibitions. Although four-field training was required of graduate students, the program focused on North American aboriginal studies. Thompson's 1933 dissertation, *Trade in South Eastern New Guinea*, was the first one based on fieldwork beyond Native North America.

Transforming the Department and the Museum: 1940–1959

World War II slowed the production of dissertations and faculty research, as many faculty and graduates became involved in the war efforts. For example, both Steward and Beals participated in government programs focused on ethnological research and training in Latin America. Two immediate products of their work were the creation of the Institute of Social Anthropology within the Smithsonian Institution and the publication of the *Handbook of South American Indians.*

After spending the period from 1944 to 1953 working for the Institute of Social Anthropology in Mexico and in Washington, D.C., the ethnologist George M. Foster (PhD, Berkeley, 1941) returned to Berkeley in 1953, becoming head of the museum when Gifford retired in 1955 and then department chair in the late 1950s. He played a key role in designing a new building—honoring Kroeber, who had retired in 1946—as the new home of the department and the museum.

By the 1950s, with Kroeber, Lowie, Gifford, and Olson, all retired or deceased, a second generation was taking charge of the department and the museum. Foster, the archaeologist Robert Heizer (PhD, Berkeley, 1941), and the physical anthropologist Theodore McCown (PhD, Berkeley, 1939) held faculty positions. Other key faculty at that time included William Bascom, an Africanist who served as museum director from 1957 to 1979; David Mandelbaum, a specialist on India; and John Rowe, a Harvard-trained Andeanist archaeologist. Sherwood Washburn left the University of Chicago and brought the "New Physical Anthropology" to Berkeley in 1958, where he directed projects related to human evolution and behavioral primate studies.

Faculty growth was driven to a great extent by an increase in enrollments, due in part to the desire of returning veterans to pursue work in anthropology. The number of PhDs granted doubled from 20 during the 1940s to 40 during the 1950s. Faculty and graduate student research expanded from North American aboriginal populations to indigenous peoples outside the United States, as well as to contemporary nonindigenous communities within the United States. This transformation is reflected in articles appearing in the *Kroeber Anthropological Society Papers*, established in 1950. By 1959, the Robert H. Lowie Museum of Anthropology (so renamed when it moved into Kroeber Hall) had more than 417,000 catalogued specimens in its collections, only half of which were related to California ethnology and archaeology.

Expansion Through Research and Training Grants: 1960–1979

After moving into their new facilities, the department and museum were positioned for major growth. Fortunately, external funding for supporting field research and the training of graduate students was increasing. For example, Foster received a 3-year National Science Foundation grant in 1958 to return to Tzintzuntzan, Michoacán, where he had done fieldwork during 1945–1946 while with the Institute of Social Anthropology in Mexico.

His grant supported four dissertations. Through his initiative, the department received three consecutive 5-year National Institute of General Medical Sciences training grants, lasting from the mid-1960s until Foster's retirement in 1979 and supporting more than 100 graduate students for research on medical and social topics. This success led to the creation in 1972 of the joint UCSF-UCB (University of California at San Francisco and Berkeley) program in medical anthropology, initially directed by Foster's first doctoral student, Margaret Clark (PhD, Berkeley, 1954).

New faculty members brought to Berkeley their distinctive contributions. Laura Nader came in 1960 as an assistant professor. She received major funding for her Berkeley Village Law Project (1965–1975), through which 10 students did dissertations on the disputing process in diverse communities around the globe. Eugene Hammel (PhD, Berkeley, 1959) rejoined the department in 1961 after a brief stint at the University of New Mexico. Alan Dundes brought his wide-ranging interest in folklore in 1963. Elizabeth Colson, known for her work in eastern Africa, came as a professor in 1964, bringing with her what would become the long-term Gwembe Tonga Relocation Project. Other senior professors included Burton Benedict, Gerald Berreman, George DeVos, and John Gumperz. In the 1970s, two more Berkeley-trained anthropologists were added: Stanley Brandes, who would become well-known for his work in Spain and Mexico, and John Ogbu, who would become a leader in anthropology and education.

During the 1960s, more than 70 PhDs were granted in cultural anthropology alone, plus another 20 or so in the other subfields. These numbers more than doubled during the 1970s. By 1979, the collections of the museum had grown to half a million catalogued specimens, with most recent acquisitions coming from far beyond California and Native North America.

Building for the Future: 1980–1999

In 1980, the faculty consisted of 17 cultural anthropologists, 6 archaeologists, 4 physical anthropologists, and 4 linguists. In addition, 3 emeritus professors in cultural anthropology and 1 in archaeology were still active in teaching and research. Eight other anthropologists were located in other units on the campus. By 1999, the faculty had a different profile: 13 full-time cultural anthropologists plus 10 with emeritus status, 8 archaeologists and 4 emeritus individuals, no full-time physical anthropologists but 4 with emeritus status, 1 linguist and another with emeritus status, and 15 anthropologists located in other campus units.

The tradition of having a core of faculty members who had received their doctorates at Berkeley was sustained when Nancy Scheper-Hughes (PhD, Berkley, 1976) returned in 1982 to become a leader of the medical anthropology program. Other important additions to the departmental faculty included Margaret Conkey, Patrick Kirch, and Ruth Tringham in archaeology and Aihwa Ong and Paul Rabinow in cultural anthropology.

Anthropology at Berkeley moved in directions that Kroeber could never have imagined. Capitalism and colonialism, conflict and inequality, critical medical anthropology and biotechnology, cultural symbolism and modernity, gender and sexuality, and globalization and transnationalism became topics of everyday conversation in the second-floor student-faculty lounge (known as the Gifford room), as well as subjects of faculty research and doctoral dissertations. The more than 350 dissertations submitted between 1980 and 1999 represented a 50% increase over the 1960–1979 period, even though funding for graduate studies and dissertation research had shrunk considerably. The historical midpoint in the number of dissertations from 1908 to 2011 came in 1990.

The 1990s also witnessed two important institutional changes. In 1997, the Anthropology Library was renamed, amid great celebration, in honor of George and Mary Foster, longtime benefactors of anthropology at Berkeley and other institutions. The Lowie Museum was renamed, with considerable controversy, in honor of Phoebe A. Hearst in 1991. By 1999, its collections had grown to more than 600,000 catalogued items, representing about 3.8 million individual objects, accessible through Delphi, the museum's online collections browser.

The Centennial and Beyond

The department and the museum jointly celebrated their centennial in 2001. Exhibits, conferences, and colloquia marked 100 years of accomplishments in conducting ethnographic and archaeological

fieldwork, studying primates and human evolution, understanding languages in social contexts, and collecting artifacts from everywhere.

Although economic challenges have plagued California since 2000, anthropology has been able to retain senior faculty, promote and grant tenure to junior faculty, and make new hires—although none had a Berkeley PhD. By 2011, the full-time faculty had grown to 28, with 17 in cultural anthropology, 9 in archaeology, and 2 in physical anthropology. Fifteen faculty members were emeritus, and 11 anthropologists were in other units on the campus. The 1st decade of the 21st century saw more than 250 dissertations submitted to the department.

Over more than a century, the diversity of faculty research and that of hundreds of Berkeley graduates has expanded far beyond the original visions of Mrs. Hearst and Professor Kroeber. Because of their accomplishments, numerous Berkeley anthropologists (and those who were trained there) have been elected to the National Academy of Science and the American Academy for Arts and Sciences, have received prestigious Guggenheim and Fulbright Fellowships, and have served in high offices in professional organizations. The first 110 years of Berkeley anthropology have witnessed significant contributions to the development of theories and methods and to the growth of the discipline in the United States and beyond.

University of Michigan

The Department of Anthropology at the University of Michigan has grown into a department internationally recognized for its teaching, graduate training, scholarship, cutting-edge research, and the contributions its faculty and students have made to the four subfields of anthropology and especially to anthropological theory. Indeed, the faculty at Michigan have been some of the leaders of theoretical developments in American anthropology. The department has been ranked first (or tied for first) in the three most recent National Research Council rankings, in 1982, 1995, and 2010–2011. Michigan's commitment to four-field anthropology has been one of the reasons why it has maintained that ranking over the decades.

Background

The University of Michigan's Department of Anthropology was established in 1929 by Carl E. Guthe (1922–1946 at Michigan), aided by Julian H. Steward (1928–1930). The department initially occupied one room in the Museum of Anthropology (established in 1924). Guthe and Steward were joined in 1930 by Leslie A. White and in 1936 by Misha Titiev. Steward left the department in 1930 for the University of Utah (a move he would come to regret). After World War II, as was true elsewhere in the United States, the department expanded rapidly, reflecting the postwar increase in the student population and a growing awareness of the importance of understanding different cultures and world areas.

Michigan's PhD program in anthropology, established in 1948, was the second in the Midwest, following the University of Chicago. In 1954, to accommodate a growing faculty that now included 15 members, the department moved from the museum to Angell Hall. In 1963, Norma Diamond, a China specialist, became the department's first female assistant professor. By 1965, there were 24 faculty members, rising to more than 30 by 1970. (This author joined the department in 1968, remaining there for 42 years through 2010.)

In 1981, the departmental headquarters and most of the faculty moved again, this time to the first and second floors of the College of Literature, Sciences, and the Arts building—just down the hall

from the dean's office. The department's archaeologists (along with the paleoanthropologist C. Loring Brace) stayed in the museum, where they still have their offices, even after the department's most recent move, to more spacious quarters in West Hall in 2004. Michigan's Department of Anthropology currently boasts more than 60 faculty members, offering more than 250 courses at the undergraduate and graduate levels. The department now trains more than 200 graduate students, graduates some 100 majors annually, and attracts more than 5,000 student enrollments per academic year.

The Four-Field Approach to Anthropology

The hallmark and major strength of the department has been its commitment to a classic four-field approach. Michigan anthropologists are well-known for their scholarly contributions in sociocultural anthropology, anthropological archaeology, biological anthropology, and, most recently, linguistic anthropology. Basic training in the four subfields is required for graduate students and undergraduate majors. About 2,000 undergraduates annually take Anthropology 101, which surveys the four subfields. Reflecting and helping spread the Michigan tradition, Conrad Kottak's four-field textbook *Anthropology: Appreciating Human Diversity* entered its 15th edition in 2013.

Among the subfields, sociocultural anthropology is the largest. (Biological anthropology, however, has been particularly attractive to Michigan undergraduates.) Nine of the 16 department chairs have been sociocultural anthropologists (Leslie White, 1944–1956; Elman Service, 1962–1963; William Schorger, 1965–1966 and 1967–1970; Eric Wolf, 1970–1971; Richard Beardsley, 1971–1972; Roy Rappaport, 1975–1980; Sherry Ortner, 1986–1989; Conrad Kottak, 1996–2006; and Tom Fricke, 2009–present).

The department's contributions to theory have been particularly significant, with the name of Leslie White among the most prominent in the history of anthropological theory. White, who remained at Michigan for 40 years (1930–1970), trained influential anthropologists such as Robert Carneiro, Gertrude Dole, and Beth Willingham. In the 1950s and early 1960s, White, Elman Service, and Marshall Sahlins (along with Steward at Columbia University) championed a resurgence of cultural evolutionary studies in anthropology. The high points included White's *The Evolution of Culture* (1959), Sahlins's and Service's *Evolution and Culture* (1960), and Service's *Primitive Social Organization* (1962). During the 1960s, Michigan had so many Columbia PhDs—including Wolf, Sahlins, Service, Roy Rappaport, Niara Sudarkasa, and Conrad Kottak—that people talked of a "Columbia-Michigan axis" made up of anthropologists interested in evolution, ecology, and social change.

Besides his evolutionism, White was an equally strong advocate for the importance of culture as an autonomous field of study. Laying out his case in *The Science of Culture* (1949), White saw cultural anthropology as a science that he called culturology. He disputed what was then called the "great man theory of history," the idea that particular individuals were responsible for great discoveries and epochal changes. White looked instead to the constellation of cultural forces that produced great individuals. During certain historical periods, such as the Renaissance, conditions were right for the expression of creativity and greatness, and individual genius blossomed. At other times and places, there may have been just as many great minds, but the culture did not encourage their expression. As proof of this theory, White pointed to the simultaneity of discovery. Several times in human history, when culture was ready, people working independently have come up with the same revolutionary idea or achievement at the same time. Examples include the formulation of the theory of evolution through natural selection by Charles Darwin and Alfred Russel Wallace and the rediscovery of Mendelian genetics independently by three different scientists in 1917.

Joining the Michigan faculty in 1961 and remaining there for 10 years, Wolf became a key figure in the anthropology of complex societies and was known especially for his studies of peasants in Europe and Latin America. As White, Sahlins, and Service were reviving interest in cultural evolution by focusing on ancient and nonindustrial societies, Wolf chose to study more recent changes—historical processes in societies clearly formed within or influenced by the post-Columbian world system. Because of his interest in cultural history, the world system, and colonialism, and his penchant for interdisciplinary collaboration with social historians like Charles Tilley and Sylvia Thrupp, Wolf was a key figure in Michigan anthropology's historical turn. The focus

on social and cultural history, and the comparative approaches that Wolf helped inspire, is embodied today in Michigan's outstanding joint doctoral program in anthropology and history.

Rappaport (hired in 1966) drew international attention to the Michigan department with his work in ecological anthropology and, later, the anthropology of religion. Along with Rappaport, Kent Flannery, Richard Ford, and Conrad Kottak offered training, including a jointly taught course, in ecological anthropology. The ecological approach at Michigan today is represented by Tom Fricke and Stuart Kirsch.

Also influential in Michigan's historical turn was Sherry Ortner, who joined the faculty in 1977 and served as department chair between 1986 and 1989. Trained in symbolic and interpretive anthropology at the University of Chicago, Ortner wrote an influential article, "Theory in Anthropology Since the Sixties (1984)," which established her as a prominent voice in theory in sociocultural anthropology (especially practice theory). Ortner worked with Nicholas Dirks (1987–1997 at Michigan) to establish the University's Joint Doctoral Program in Anthropology and History, which continues to thrive today. After Ortner and Dirks left Michigan for Columbia in 1995 and 1997, respectively, Ann Stoler, Fernando Coronil, and David William Cohen ably led this joint program.

Ecological and historical anthropology (both particularly suited to a four-field department) continued as departmental foci into the 21st century. Research on complex and contemporary societies has been another traditional departmental strength, ranging from Wolf's studies of peasants in the 1960s to current interests in colonialism, postcolonial studies, globalization, and nationalism. The area studies centers established after World War II at various major American universities have ensured Michigan's continuing expertise in China, Eastern Europe, Japan, and the Middle East/North Africa.

Michigan was not one of the universities granted postwar funding for area studies centers focusing on Africa or Latin America in the late 1940s. Since 1970, however, Michigan's strength in those regions has increased significantly. Michigan's Africanist faculty has grown along with that of the Department (formerly the Center) for African and Afro-American Studies, of which the former Michigan anthropologist Niara Sudarkasa (1967–1986) was a founder and early director. Similarly, the growth of the department's Latin Americanist faculty has accompanied that of the Center for Latin American and Caribbean Studies, led for several years by Bruce Mannheim, who also has been influential in establishing the university's Andean Studies and Quechua training programs.

The theoretical orientations of current department members range from humanistic to strongly scientific. Sociocultural faculty members elected to the National Academy of Sciences include Steward, Sahlins, and Wolf (after they left Michigan), along with Kelly Askew (1971–2004) and Kottak. Michigan anthropologists elected to the American Academy of Arts and Sciences include Flannery, Ford, Kottak, Joyce Marcus, Ortner, John O'Shea, Rappaport, and Katherine Verdery. MacArthur "Genius" awardees have included Wolf and Ortner, along with the current faculty members Ruth Behar, Erik Mueggler, and Henry Wright.

Anthropological archaeology also remains a strong and well-represented subfield at Michigan. Two archaeologists have served as department chair (James Griffin, 1972–1975, and Ford, 1989–1996). Michigan archaeologists are known for their focus on cultural evolution and their contributions to understanding key origins: of human culture, of Neolithic economies, of hereditary inequality, and of chiefdoms and states. Some of this work has involved collaboration with Michigan's sociocultural anthropologists pursuing similar interests—for example, Kelly, Kottak, and Rappaport. Michigan archaeologists elected to the National Academy of Sciences include Griffin, Flannery, Marcus, and Wright. Both Marcus and Flannery have served 3-year terms as chair of Section 51, Anthropology—as, most recently, has Kottak. In 2013, Marcus began a 3-year term as secretary of Class V, Social Sciences, to be followed by a 3-year term as Class V chair. Michigan's anthropology PhDs are particularly well represented among current academy members.

Key figures in biological anthropology at Michigan have included Stanley Garn (1968–1992 at Michigan and a former member of the National Academy of Sciences), Frank Livingstone (1959–1996), John Mitani and Milford Wolpoff (both still active), and the recently retired Loring Brace (1967–2008) and A. Roberto Frisancho (1968–2011). Brace, Frisancho, and Wolpoff have been honored with the Darwin Award, bestowed annually by the

American Association of Physical Anthropologists. Three biological anthropologists (Fred Thieme, 1957–1958; James Spuhler, 1959–1962, 1963–1965, and 1966–1967; and Frank Livingstone, 1983–1986) have served as department chair. Michigan's expertise in biological anthropology encompasses paleoanthropology, primate behavior and evolution, human adaptation, and evolutionary biology and ecology.

Linguistic anthropology has grown substantially at Michigan over the past 2 decades, spurred largely by the vision and efforts of Mannheim, so that Michigan today has one of the nation's preeminent programs in this subfield. Along with Mannheim, Michigan's linguistic anthropologists now include Judith Irvine (department chair, 2006–2009), Alaina Lemon, Barbra Meek, and Michael Lempert. Webb Keane, well-known for his work in semiotics, contributes to this subfield as well as to sociocultural anthropology. Emeritus professor Robbins Burling (1963–1995) served as department chair from 1980 to 1983 and is recognized for his work with linguistic theory, and language and culture.

Inderdepartmental and Interdisciplinary Initiatives; Recent Developments

Michigan's Department of Anthropology has a tradition of working actively with other departments and centers, including joint appointments with several other units. Michigan's anthropologists maintain affiliations with the biological and health sciences, the other social sciences, and the humanities, as well as with geographic area centers, women's studies, Latino studies, and African/Afro-American studies. The Horace H. Rackham School of Graduate Studies offers nationally recognized joint programs in anthropology and social work, and anthropology and history. Michigan's anthropologists have been influential in the establishment and direction of area studies centers and the development of interdisciplinary initiatives, most notably the Evolution and Human Behavior Program and the Program in the Comparative Study of Social Transformations.

By 1975, Michigan was awarding equal numbers of anthropology PhDs to men and women. By the 1990s, more women than men were receiving PhDs from the department. Michigan's anthropology faculty has included well-known senior women in the past (Diamond, Ortner, Stoler, and Verdery) and present (Kelly Askew, Behar, Gillian Feeley-Harnik, Irvine, Alaina Lemon, Laura MacLatchy, Marcus, Elisha Renne, Jennifer Robertson, Gayle Rubin, Carla Sinopoli, and Beverly Strassmann).

The department has been careful to keep up with the changes in anthropology while maintaining its commitment to the four-field approach. Today, various faculty members are investigating issues of globalization, development, gender, race, ethnicity, and environmental anthropology. Studies of colonialism, states, and power relationships, and the analysis of the ethnographic enterprise itself also have been important. Michigan's Department of Anthropology has grown into a large and inclusive academic unit that is remarkable for the diversity of its faculty and students, along with its wide geographic spread and its diverse theoretical orientations. (For current Michigan faculty members and their areas of specialization, see http://www.lsa.umich.edu/anthro/people/faculty.)

Urban Studies

Some anthropologists do research in cities but without much concern, if any, for the urban context; others are more concerned with the structure of city life and its impact on human behavior locally or cross-culturally; and still others are concerned with the development of international urban systems through

time and space as distinctive social cultural domains. The focus on urban studies by anthropologists is usually on relatively small populations (e.g., people from one village who have migrated to a city, the culture of one ethnic population of one city, female members of one gang in one city). Urban anthropologists then describe and explain why a particular population behaves as it does in the specific setting(s) in which it is located. Thus, urban studies as conducted by anthropologists focus on the cultural systems of selected populations, compare the cultural systems of these populations, and offer contextual explanations for the attitudes and behaviors observed among these populations.

Development of Urban Studies in Anthropology

Although the term *urban anthropology* began to be used widely in the 1960s, earlier anthropologists had started to redefine their field as more than the study of "primitive" peoples living in exotic locales. From the 1930s to the 1950s, cultural anthropologists increasingly turned their attention to the study of peasants, small-scale food producers incorporated into nation-states dominated by cities. Robert Redfield's research in Mexico, especially his 1926–1927 community study of the village of Tepoztlán and his collaborative project published in 1941 as *The Folk Culture of Yucatán*, raised a number of provocative questions about the impact of cities on relatively isolated peasant villages and the contrast between the ideal types of what Redfield called "folk" and "urban" communities. The focus was on the scale of communities, their ways of life, and the degree to which any specific community (and its residents) displayed "urban" characteristics. In taking this approach, Redfield was following the model of his sociological colleagues at the University of Chicago, especially that represented by Louis Wirth in his famous 1938 essay "Urbanism as a Way of Life."

In the 1940s, Oscar Lewis did a restudy of Tepoztlán and concluded that peasant life was far from idyllic. He then turned his attention to the migration of some villagers from Tepoztlán to Mexico City and their lives in the metropolis. His fieldwork led him to challenge U.S.-based models about urban life. His 1959 book *Five Families: Mexican Case Studies in the Culture of Poverty* became controversial because of his attention to what Mexican critics termed the "lurid" aspects (i.e., sexual exploits, criminal activities, and immoral acts) of life in Mexico City. A group of elite Mexican intellectuals accused Lewis of defaming the Mexican national character, but the Mexican courts found him innocent of the charge.

By the 1950s, a number of anthropologists were conducting research on urban phenomena. In 1951, Ralph Beals published the lead article in the journal *American Anthropologist* on the problem of defining and differentiating the terms *urbanism*, *urbanization*, and *acculturation*. In mid-decade, in a manner similar to what Lewis had done for Mexico City, William Bascom offered a test of Western urban theories in an article on urbanization among the Yoruba published in the *American Journal of Sociology*. In the same year, Gideon Sjoberg published a model for what he termed the "preindustrial city," a form of urban place that stood in contrast to the kinds of cities that developed after the European Industrial Revolution. Meanwhile, in Europe and in Africa (especially at the Rhodes Livingston Institute), anthropologists were discovering that social network analysis provided important insights about personal interaction in urban settings.

By the end of the 1950s, anthropologists and other social scientists were combining ethnographic observations drawn from specific case studies with national-level census data to develop new ideas about trends in urbanization in Latin America, Africa, and Asia. For example, the United Nations organized a conference in 1959 on the theme of urbanization in Latin America, at which the Peruvian anthropologist José Matos Mar presented a now classic paper on the *barriadas* (squatter settlements) of Lima. His paper, and others like it, set the research agenda for the following generation of scholars interested in rural-urban linkages, peasant migrants in cities, and squatter settlements as arenas of urban adaptation.

The 1960s

The growing interest in urban studies among anthropologists reflected their recognition that the traditional subjects of anthropological fieldwork were increasingly being integrated into an urban-dominated world. The "War on Poverty" in the United States and the expansion of funding for international development projects—especially in Latin America, Africa, and Asia—greatly increased opportunities for anthropologists and other social scientists to carry out significant urban research.

There was a steady expansion of urban studies by anthropologists during the 1960s, with particular attention given to rural-to-urban migration, urban adaptation, ethnicity, and poverty. The decade of the 1960s ended with the publication of papers delivered at the 1968 Southern Anthropological Society conference on "Urban Anthropology: Research Perspectives and Strategies." Two similar conferences, one held at an American Anthropological Association meeting and the other at the School of American Research in Santa Fe, New Mexico, also took place in 1968. Their joint results appear in the 1972 volume *The Anthropology of Urban Environments*.

The 1970s

By the beginning of the 1970s, urban anthropology came to be defined by most of its practitioners as a distinctive domain within cultural anthropology. The result was a tremendous growth in textbooks, readers, and reviews aimed at students taking new courses in urban anthropology. The journal *Urban Anthropology* was started in 1972 and has continued to the present under the editorship of Jack Rollwagen. The Commission on Urban Anthropology was created in the late 1970s within the International Union of Anthropological and Ethnological Sciences. The commission not only conducts sessions at the congresses of the International Union of Anthropological and Ethnological Sciences, held every 5 years, but it also sponsors international conferences and occasional publications on urban anthropology. Thus, the subfield of urban anthropology took its place among the burgeoning number of specializations within sociocultural anthropology (e.g., educational, legal, medical, political, psychological, and visual anthropologies).

Among the top priorities was working out the similarities and differences between traditional fieldwork and the new urban studies—that is, how anthropologists in cities should do their research and what should be their thematic foci. When Richard Basham published his influential textbook *Urban Anthropology: The Cross-Cultural Study of Complex Societies* in 1978, the essential themes of urban studies in cultural anthropology were becoming clear. He discussed the nature of urban and complex societies; the origin and evolution of cities; rural-to-urban migration and the growth of cities; kinship in the city; migrants and urbanites; class, caste, and ethnicity; and urban ethnology and ethnology.

The 1980s

During the 1980s, a second generation of readers, textbooks, and surveys of the subfield of urban anthropology appeared, as well as a torrent of case studies on specific urban populations and places. In 1980, two readers were published to compete for the market in urban-anthropology courses. The first, *Urban Life: Readings in Urban Anthropology*, edited by George Gmelch and Walter Zenner, contained 30 contributions organized within the domains of urbanism, migration and the adaptation of migrants to city life, family and kin in urban society, ethnicity and class in the city, the urban poor, and urban fieldwork. The second, *Urban Place and Process*, edited by Irwin Press and M. Estellie Smith, had 34 papers arranged under the categories of urbanism, the urban milieu, the development and differentiation of cities, urbanization, units of urban organization, urban places, economic and cultural differentiation in the city, and the urban future.

These and similar volumes set the stage for a decade in which urban anthropologists would raise their sights (and sites) from local, isolated urban communities to the linkages among communities within regional, national, and international sociocultural and political-economic systems. The resultant transformation in the work of urban anthropologists not only involved a change of geographical scale but also meant that more attention was paid to historical issues.

A provocative assessment of the subfield was offered by Roger Sanjek. After a brief history of the field, Sanjek discussed "urban anthropology as anthropology" and then provided coverage of urban ethnography on a region-by-region basis, including the United States, the Caribbean and Latin America, Europe, the Middle East and North Africa, Africa, and East Asia, and Southeast Asia and Oceania. He concluded his review by suggesting that the urban anthropology of the 1980s might offer *all* anthropologists conceptual pathways to practice.

The 1990s

Whereas earlier urban anthropologists had focused on issues (e.g., migration, family and kinship, social networks, poverty, ethnicity, and urban adaptation)

derived from or contrasted with traditional rural-based fieldwork, by the 1990s, anthropologists had expanded their interests to include virtually every dimension of urban life—from individual life stories to city neighborhoods and institutions (e.g., hospitals, schools, and jails) to linkages among places and populations of different scales within a global and transnational urban system. Anthropologists gave attention to class-based models of cities and their contexts, the impact of colonialism on cities, and the integration of cities into a worldwide urban system. As a result, urban anthropology became more integrated into the discourse of other social sciences, and urban anthropologists cited non-anthropological works more frequently and with less hesitation. A marker of this shift in orientation came in 1997 when the Society for Urban Anthropology (established in 1979) became the Society for Urban, National, and Transnational/Global Anthropology.

Another emerging thrust in anthropological urban studies during and since the 1990s was a concern for "space and place." The importance of spatial and symbolic features of community was especially evident in the work of Setha Low, a specialist in cultural and environmental studies. In 1999, she edited a volume titled *Theorizing the City: The New Urban Anthropology Reader*. This volume focused on the divided city, the contested city, the global city, the modernist city, and the postmodern city. The 12 essays, each a case study of specific communities within particular urban settings emphasized "new" perspectives for understanding urban life.

The 2000s

Urban studies is now an important subfield within the anthropological discipline, not just in the United States but also on a global basis. Research and teaching about cities and urban systems has become a standard component of contemporary sociocultural anthropology. Whether anthropologists are dealing with problems such as the destruction of tropical rain forests or ethnic violence in inner-city slums, we are constantly reminded that the global system is tightly tied to metropolitan nodes of power and culture. As the world continues to become more urban—with more than 50% of the world's people living in cities as of 2012—we all are involved in urban studies. Perhaps the current century will witness a time when "urban anthropology" will become the norm and we will create a "rural anthropology" specialization as the marked category within our discipline, as it came to pass with the development of "rural sociology" during the early 20th century.

Utilitarianism

Utilitarianism is a moral theory or a family of moral theories. After providing an initial characterization of utilitarianism, this entry briefly discusses the theory's history, some of the ways in which it has been developed recently, and some of its possible implications.

A moral theory attempts to explicate the difference between morally right and morally wrong actions. Utilitarianism belongs to a broader family

of moral theories known as *consequentialism*. In its simplest form, consequentialism states that we are morally obligated to do whatever would produce the best outcome—that is, whatever would have the best consequences. What utilitarianism adds to consequentialism is a particular understanding of what counts as the best outcome. Utilitarians subscribe to "welfarism," the view that only well-being or "utility" has intrinsic value (i.e., is valuable for its own sake). They therefore conclude that producing the best consequences means producing the greatest amount of well-being possible—in other words, *maximizing utility*. So in its simplest form, utilitarianism holds at any given moment we are morally obligated to choose, out of the various actions that it would be possible for us to do, the one that would yield the greatest total amount of well-being. To do anything else would be wrong. This means the greatest amount of *total* well-being, which depends not only on how the different actions that we could perform would affect us but also on how they would affect everyone else to whose lives they might make a difference at any point in the future. Thus, what we should do depends on which of our potential actions offers the optimal balance of costs and benefits. Notice that utilitarians believe that the empirical knowledge that the social sciences provide plays a crucial role in our reasoning about what our moral obligations are, since we need it to predict actions' consequences.

Although one can find historical antecedents for utilitarianism going back to the classical world, the view first really crystallized in 19th-century Britain. Jeremy Bentham (1748–1832) is usually credited with being its founder. Bentham was a hedonist, which is to say that he believed that the only things that are valuable in their own right are pleasure and freedom from pain. This was his definition of "happiness," and for Bentham happiness was identical with well-being. Bentham believed that we are obligated to produce as much of what we might call "total net happiness" as possible, where "net happiness" refers to pleasure minus pain. John Stuart Mill (1806–1873), a utilitarian of the next generation, made a controversial revision to Bentham's hedonism. Mill claimed that a given quantity of a distinctly human pleasure, such as intellectual pleasure or aesthetic pleasure, is more valuable and contributes more to our happiness than the same quantity of a bodily or animalistic pleasure. So Mill believed that maximizing happiness does not simply mean maximizing pleasure (or even maximizing pleasure and minimizing pain), since greater weight must be given to the "higher" pleasures. Other important British utilitarians from this century include Henry Sidgwick (1838–1900) and Herbert Spencer (1820–1903).

In the 20th century, many utilitarians rejected Bentham and Mill's hedonistic conception of well-being. It is not difficult to imagine lives that are full of pleasure and yet seem to involve only low levels of well-being; consider, for example, a person who derives great pleasure from believing that she has a loving spouse and many friends, when in fact she is deceived or otherwise deluded on these points. Today, utilitarians more commonly identify well-being with the satisfaction of one's preferences or of some subset of one's preferences, such as one's preferences about one's own life. This brings the contemporary utilitarian's understanding of utility closer to that of contemporary economists, although utilitarian philosophers generally do not follow economists in insisting that we can know people's preferences only insofar as they are revealed by their choices. Utilitarians also tend to be more sanguine than economists about the possibility of comparing the utility levels of different individuals.

While the simplest form of utilitarianism applies the imperative to maximize utility directly to individual actions, this so-called act utilitarianism is not the only form that the view can take. One alternative is "rule utilitarianism." The rule utilitarian maintains that whether particular actions are right or wrong depends on whether an authoritative moral code or a set of moral rules would permit or forbid them. The utilitarian element of the view comes in its account of this authoritative moral code. According to the rule utilitarian, this is the moral code whose "general acceptance" would have the best consequences.

Peter Singer, arguably the English-speaking world's most prominent living philosopher, has done much to draw out the practical implications of act utilitarianism. According to Singer, utilitarianism requires us to make significantly less use of animals for food or scientific experiments, since it says that we must take into account the well-being of every sentient creature and that many of the harms that we inflict on animals are of greater magnitude than any benefits to us. Singer also argues that utilitarianism requires members of affluent countries to make

considerable personal sacrifices in the interest of fighting poverty in the Third World and to permit abortion and euthanasia when this would prevent unnecessary suffering. Of course, what implications one takes utilitarianism to have will depend not only on what precise version of the theory one considers but also one's empirical beliefs.

Rule utilitarianism's implications are presumably similar to those of act utilitarianism in many respects. It is likely that rule utilitarianism would also demand major changes in our treatment of animals and entail the permissibility of abortion and euthanasia in certain situations. But in some areas, their implications would differ. For example, the moral code whose general acceptance would have the best consequences might require citizens of affluent nations to give approximately 10% of their income to fight extreme poverty, since if everyone gave that much, we could provide food security, clean water, and basic medical care worldwide. That is much more than most people give today, but it is still far less than what Peter Singer takes act utilitarianism to require us to sacrifice. This is because rule utilitarianism requires us to follow rules that should be widely accepted even if in reality they are not, whereas act utilitarianism tells us to do whatever would have the best consequences given what other people are actually doing (or, in the case of contributing to eliminating poverty, not doing).

V

Vayda, Andrew P.

Andrew "Pete" Vayda (1931), professor emeritus of anthropology and ecology at Rutgers University and senior research associate at the Center for International Forestry Research, has been a leading thinker in human ecology and ecological anthropology for more than half a century.

Biography and Major Works

Vayda was born in Budapest, Hungary, and was taken at the age of 7 by his mother to live in New York City. He completed a BA and PhD in anthropology at Columbia University. His doctoral dissertation, based on library research in New Zealand, described in detail what Maori warfare was like and how it related to environmental, economic, and demographic factors before it was greatly altered by European weapons and ways. Completed in 1956, it was published in 1960 as a monograph, *Maori Warfare*, and formed the basis of a seminal article, "Expansion and Warfare Among Swidden Agriculturalists" (1961).

After completing his PhD, Vayda used a grant from the Social Science Research Council to conduct fieldwork in 1956–1957 on three coral atolls of the Cook Islands in Polynesia. Vayda's first academic position was a limited-term appointment to the Department of Sociology, Anthropology, and Criminology at the University of British Columbia (1958–1960). At the University of British Columbia, he wrote "A Re-Examination of Northwest Coast Economic Systems" (1961), a groundbreaking interpretation of the potlatch ritual of Pacific Northwest Coast Indians, using neo-functionalist (systems) ecology.

Vayda returned to Columbia University as a faculty member in 1960. In the ensuing decade, he conducted fieldwork in Papua New Guinea; wrote articles interrelating war, economics, and ecology; edited two anthologies, *Peoples and Cultures of the Pacific* (1968) and *Environment and Cultural Behavior* (1969); and, with Anthony Leeds, coedited *Man, Culture, and Animals: The Role of Animals in Human Ecological Adjustments* (1965). With his then graduate student Roy Rappaport, he also coauthored "Ecology, Cultural and Non-Cultural" (1968), a highly influential critique of Julian Steward's cultural ecology.

While still at Columbia, Vayda became founding editor of the new journal *Human Ecology*. But by the early 1970s, he had become disillusioned with the neo-functionalist systems thinking and cultural materialism that were then influential among anthropology faculty at Columbia. This contributed in 1972 to his accepting a position at Rutgers University, with a mandate to integrate the biological and agricultural programs of the College of Agriculture and Environmental Sciences with the social sciences and humanities. He subsequently served as dean, played a lead role in the development of interdisciplinary environmental curricula, and founded the Department of Human Ecology. In 1975, Vayda coauthored with his former graduate student and new Rutgers colleague Bonnie McCay the influential article "New Directions in Ecology

and Ecological Anthropology," a critique of the neo-functionalist ecological anthropology that he had previously advocated. His book *Warfare in Ecological Perspective* was published in 1976.

In 1979, Vayda initiated what would become a long-term program of multisited, multidisciplinary research on peoples' interactions with tropical forests in Indonesia. In the following 3 decades, he would work in association with the United Nations Educational, Scientific, and Cultural Organization–Man and the Biosphere program, the University of Indonesia, World Wide Fund for Nature, The Center for International Forestry Research, The Food and Agricultural Organization of the United Nations, the Ford Foundation, and others on a range of topics including the causes and consequences of tropical deforestation and forest fires, local forest use, and integrated pest management. A number of significant publications emerged during this period, including "Progressive Contextualization: Methods for Research in Human Ecology" (1983), "Failures of Explanation in Darwinian Ecological Anthropology" (1995), *Methods and Explanations in the Study of Human Actions and Their Environmental Effects* (1996), and "Against Political Ecology" (1999, coauthored with then graduate student, Bradley Walters).

Vayda retired from formal teaching duties at Rutgers in 2002 but has since continued his field research, teaching, and writing. A Festschrift in his honor, *Against the Grain: The Vayda Tradition in Human Ecology and Ecological Anthropology*, was published in 2008. *Explaining Human Actions and Environmental Changes*, a selection of his essays on explanation and explanation-oriented research in the social sciences and human ecology (spanning the late 1980s to 2008), was published in 2009, and *Causal Explanation for Social Scientists: A Reader*, coedited by him and Bradley Walters, was published in 2011.

Key Contributions to Theory and Methodology

Arguably no anthropologist other than Vayda has had such a large and sustained influence in bringing an ecological perspective to the discipline. Early in his career, Vayda, like most of his contemporaries, concentrated his research on non-Western societies and looked for the "big ideas" that would explain cultural similarities and differences. This way of thinking was manifest in the development (with Marvin Harris, Tony Leeds, Roy Rappaport, etc.) of a "neo-functionalist ecological anthropology" that challenged the cultural ecology of Julian Steward and gave birth to modern human ecology. The neo-functionalist approach situated humans within dynamic ecological systems and made populations, not cultures or societies, the central units of analysis. Cultural phenomena as perplexing as the Northwest Coast Indian potlatch, Melanesian pig feasts, and warfare were explained as adaptations that maintain the stability of the human-environment system over time.

A growing skepticism of holistic, adaptationist, and neo-functionalist analysis led Vayda subsequently to recant the ideas espoused in many of his early writings, despite their wide appeal. In fact, many of Vayda's key intellectual insights emerged through the course of his career as critical responses to preexisting theoretical ideas and research paradigms in anthropology and the wider social sciences, including some of his own making. Notable among these were critiques of cultural ecology, neo-functionalist/systems ecological anthropology, Darwinian ecological anthropology or human behavioral ecology, political ecology, and local knowledge studies.

The analysis of events and human actions had been a concern of Vayda since his earliest research on Maori warfare. Yet it was not until the late 1970s that he came to fully embrace a philosophical position that called into question anthropology's preoccupation with deriving general theory from the description and analysis of cultures and societies. In its place, Vayda argued for a focused, question-based approach to inquiry that makes attention to evidence and the details of human behavior paramount considerations, and causal explanation of events, including actions, the goal.

Vayda's highly eclectic thinking has gradually set him apart from the mainstream of anthropology, although he continues to be widely read and cited within environmental/ecological anthropology and in other disciplines, especially geography. The evolution of his distinctive approach to research and analysis draws from a wide array of influences, including diverse social and natural scientists (T. C. Chamberlin, Fredrik Barth, David Freedman, and Geoffrey Hawthorn) and philosophers (C. S. Peirce, Isaiah Berlin, David Lewis,

Michael Scriven, and Harold Kincaid). Many of his later works are steeped in the philosophy of causation and explanation and focus less on matters of theory per se and more on methodological considerations, namely, the logic and justifications guiding deployment of methods and the interpretation of research results.

Vayda's pragmatic, question-based approach to research and causal explanation was first conspicuously articulated in 1983 as "Progressive Contextualization" but was subsequently refined (in collaboration with Bradley Walters) as "Event Ecology" and, finally, "Abductive Causal Eventism." Given their (still) relative novelty to anthropologists, the full impact of these ideas remains to be seen.

Veblen, Thorstein B.

Thorstein Bunde Veblen (1857–1929) was an early-20th-century American social scientist who made his greatest contributions to sociology and economics. However, the foundation of his critical theory of modern society, including his most famous idea of "conspicuous consumption," stemmed from an anthropological perspective on early human cultures. Veblen's theory of the beginnings of the division of labor and the rise of a leisure class emphasized distinctions between "industry" and "exploit." This idea underpinned his later works on modern capitalism, technology, and war in books such as *The Theory of Business Enterprise* (1904), *The Instinct of Workmanship* (1914), *Imperial Germany and the Industrial Revolution* (1915), *The Engineers and the Price System* (1921), and *Absentee Ownership* (1923). Veblen argued that a crucial change in human development occurred in the transition between the earliest phase of human society, peaceable savagery, and its successor, predatory barbarism. Peaceable savagery was an amiable form of industrious anarchy; the more advanced civilization of barbarism stressed patriarchal class rule and glorified power, conflict, competition, and war. For Veblen, later human history produced great gains in human knowledge, especially in science and technology. It also spawned democratic institutions, and savage values of community, equality, and peace survive in the interstices of democracy. But modern societies still celebrate and reward dominant classes at the expense of underlying populations. In Veblen's view, therefore, modernity is not so modern; democracy is not so democratic; and barbarism is anything but passé.

Biography

Thorstein Veblen was the child of Norwegian immigrants. Born in rural Wisconsin in 1857, he grew up on a farm near Northfield, Minnesota. He received his undergraduate degree from nearby Carlton College and a PhD from Yale. After a 7-year hiatus from the academy, he took up the study of history and political science at Cornell, moving to his first teaching post at the University of Chicago, followed by a brief stint at Stanford and a longer tenure at the University of Missouri at Columbia. After working

briefly for the U.S. Department of Agriculture, he helped found the New School for Social Research in New York City and wrote for the radical newspaper *The Dial*. Veblen retired to northern California, where he died in 1929, months before the great stock market crash, whose financial undercurrents he had analyzed so presciently in *Absentee Ownership*.

Industry and Exploit

According to Veblen, contemporary people *think* that they have advanced well beyond the intellectual and cultural limits of aboriginal humans. Veblen was sure they have not. He argued that the distance between humankind's oldest experience and modern-day institutions and values is less than we like to think. Although their habits and practices are wrapped in contemporary garb, modern people still think and behave in ways that adhere to archaic beliefs and values. Veblen's work is an attempt to explain this contradiction anthropologically and to assess its implications for the future of the species.

Building on late-19th-century scholarship, Veblen tried to understand how the earliest forms of human society, preoccupied as they must have been with simply earning a living, changed into seemingly more advanced but warlike forms. His answer centered on a painfully slow transformation of human consciousness.

Early humans inhabited a strange, mysterious, and even enchanted world. Veblen theorized that, gradually, our aboriginal ancestors tried to understand this peculiar environment by developing distinctions between two kinds of phenomena. Many things in their world seemed to lack inner spiritual force; they seemed lifeless, inert. People learned that they could hammer or shape this kind of dead, spiritless stuff into useful objects, things necessary to carry on everyday life. This activity—Veblen termed it *industry*—was calm, uneventful, and invaluable to human survival. This sober industrious attitude—Veblen later termed it "an instinct of workmanship"—would evolve into modern technological rationality, the intellectual basis of today's machine-driven, digital society.

At the same time, early humans experienced other kinds of things in their mysterious environment: These seemed anything but inert. Things such as animals, thunder, or waterfalls appeared to resist human will, regularly evading our ancestors' best-laid plans. Veblen claimed that early people explained such recalcitrance by projecting onto these elusive aspects of their environment human characteristics of will and purpose. Such things must fight or flee from people because they are like people; they must want to be free in some sense. That is why they refuse to allow themselves to be hammered into submission. To capture this more elusive prey, people had to learn how to be hunters, not mere workers. They had to use inner guile and physical strength to defeat and master the animated forces, to make them serve human will and purpose. Veblen called this activity of strategic conquest, *exploit*. Compared with the quiet work of industry, exploit was considerably more dramatic, exciting, and stimulating. It offered a theater for the display of human prowess or power.

Of course, for Veblen, exploit was based on an illusion: the animistic idea that natural phenomena possessed human-like attributes of willfulness and purpose. But no matter, strong cultural pressures to dominate and master continued to evolve. Exploit succeeded more often than not. And as people grew ever more infatuated with their growing sense of power, exploit became a self-reinforcing, self-renewing process. Gradually, infatuation with the hunt, with capture, control, and domination, spread from the environment to other human beings as objects of exploit, especially to women. There seemed no better way to symbolize male power than to subjugate women. Thus, initially, for Veblen, the distinction between "industry" and "exploit" applied to gender: Males charged themselves with the responsibility for exploit. Taking center stage, they imposed what they saw as the drudgery of everyday labor onto women, to be performed in the dark backdrop of culture.

Through time, Veblen insisted, these social patterns hardened into habit and belief, into social norm and expectation. Men came to see exploit as the chief activity worthy of their predatory selves, the activity most deserving of social honor, prestige, and reward. Here lay the roots of what Veblen would call "the leisure class," especially its characteristically barbaric insistence on freedom from industry as the most potent sign of power and honor. Conspicuous consumption developed out of these beginnings. The ability to spend and even waste large sums, after all, was a sure sign of one's insulation from the mundane problems of earning a living.

Early humans thus left us an extraordinary anthropological legacy: Today, we pretend to know

that we must work to live, but we nonetheless continue to honor and reward those most able to avoid actually producing anything. Humans are, for Veblen, the only species in which not only do the most successful members evade activity essential to survival, but these so-called upper classes are also esteemed and rewarded for doing so. Social evolution has thus uplifted barbaric values, practices, and institutions that actually threaten the continuation of human life. This is why, for Veblen, barbaric civilizations keep rising and falling. They fail to remember the chief lesson of peaceable savagery: Work, not power, is the necessary condition of human existence.

Visual Anthropology

Visual anthropology is the area of anthropology that looks at the visual materials that cultures produce, such as art, video, and other visual objects, as well as the documentation of culture through visual forms like film and photography. Because of this splitting of focus between visual representations in films, photographs, and so on, and the visual productions of art, material culture, architecture, and performance, the definition of what visual anthropologists do has led to confusion within the field itself as it continues to struggle to find an identity defined by a single theory or method. Yet as visual signifiers become more prominent in media-saturated cultures, visual anthropology can provide the framework within which to explore cultural products and processes. Recent research by Tim Ingold, Cristina Grasseni, and Bruno Latour examines the idea that people learn how to "see" the world in specific ways. For example, people learn to understand that a map, which is not the world, is a scientific representation of space that they learn to understand as the world. This approach incorporates the ideas that seeing is cultural and that understanding images is actively constructive to an understanding of the world.

Methods

Visual anthropology's methods have focused on the media, employing film and photography in the service of illustrating ethnographic research. Sustained usage of images, as in Margaret Mead's *Balinese Character*, explored the potential of meaning making through images, focusing on an emerging use of photographs as primary-source data. Later critiques engaged documentary forms of filmmaking within a constructivist rather than a positivist model, opening up new areas of exploration in the subject of visual media as cultural document. Using visual material as the source of cultural information, through an examination of visual forms, expanded the methods of ethnographic research, drawing from communication and cultural studies.

The development of the discipline shifted the focus from the use of images and film as method to understanding the signs and pictures produced by cultures in order to understand how individuals and groups used visual objects as means of communication, allowing for the broader analysis of the production and reception of art, performance, architecture, photography, film, and other forms of visual material culture as central to the subject of visual anthropology. This emphasis on the visual aspects of culture created a broader understanding of the experiential nature of culture and incorporated phenomenological approaches that created a recognition of other ways in which culture is understood through the senses.

Reflexivity

The "reflexive turn" in anthropology has been characterized by problematizing the simple distinctions that have been historically presumed between "us" and "them" as well as the very nature of the ethnographer and his or her relation to the ethnography. According to Jay Ruby, to be reflexive is for

anthropologists to systematically reveal their methods and themselves; thereby, they demonstrate the constructed nature of their work. More precisely, the final product is illuminated by insights into the producer and the process.

Critics of postmodernism, such as Marshall Sahlins and Ryan Bishop, contend, however, that revealing too much about the methods or the individual can actually be counterproductive. Indeed, an excessive concern with either the producer or the process (or both) will undermine or even obscure the final product. Given the very fine line between revelation and self-indulgence, the challenge is to incorporate the self deliberately without degenerating into narcissism. But how much revelation is enough, and how much is too much? Ruby calls making this judgment "the most difficult aspect of being reflexive." Perhaps one way of negotiating this tenuous terrain is by not compartmentalizing the ethnographic self and the personal self as distinct or even conflicting but as mutually reinforcing. Rather, the focus should be on how each shapes and influences the other.

Traditional Areas of Inquiry

Art

Beginning with Franz Boas's *Primitive Art* (1927), formal elements in material culture and symbols were explored as central components of culture. Early studies such as Boas's created what has since been recognized as a false dichotomy between the products of anthropological subjects (non-Western, small scale), who create artifacts, and Western industrialized nations, who create "art." Incursions were made in the 1980s as attention was drawn to the construction of primitivism through work in both museology (e.g., the "Primitivism" exhibition at the Museum of Modern Art in 1984 and the "Art/Artifact" exhibition at the Museum for African Art in 1988, both in New York City) and anthropology, culminating in what Shelly Errington in 1998 called the "death of authentic primitive art." This led to a broader understanding of the role of art in sociocultural identities, roles, hierarchies, communicative patterns, aesthetics, and economics in the global world system. A move toward a critical analysis of art, technology, and culture has revealed more nuanced approaches to recognizing artistic practices as an embodied act. More recently, the discussion has moved toward engaging the terrain between art history and anthropology to mine the possibilities of understanding cultural production and reception through the co-construction of artistic works that engage anthropological content. Practitioners working between art and anthropology include Fiamma Montezemolo, Susan Hiller, John Wynne, and Andrew Irving.

Photography

Photographs have occupied a central role in anthropological and ethnographic studies as evidence and are almost always provided as illustrations to "show" aspects of the anthropological subject. They are one of the most pervasive examples of a visual media deployed in anthropological research. Margaret Mead's *Balinese Character* (1942) marked an early attempt to implement photographs as the primary technique for conveying anthropological information. With the shift in the understanding of photography from positivist evidence to subjective representation, early anthropological photographs were mined as products of ideological convention. Photo elicitation (using photographs as the means to get people to talk about culture and what they "see") and home-mode photography (how everyday people used photography in their lives) were added to visual anthropology's methods. These examples provided the earliest explorations into the use of photographs in anthropology. They set the stage for more investigative uses of the medium as a product of culture.

Laena Wilder, following the social documentarian Jacob Riis, deploys cameras on her subjects to generate an emic view (insider's view) of the group, to draw attention to social problems and to transform subjects into collaborators. These insider images, reflecting the home mode, were extended to indigenous self-representations, culminating in more contemporary explorations of photographic practice, as seen in David MacDougall's 1991 film *Photo Wallahs*. This use of photography helped provide a better understanding of the politics of representation (how people construct and how they expect to see particular cultural groups), including analyses of popular images of culture in media forms. These works represent a transformation in the use of photographs as cultural documents, objects that

generate ideologies about culture through their ability to present and re-present cultural realities.

Ethnographic Film

Ethnographic film has played a central role in the development and legitimization of visual anthropology as a subdiscipline. Yet the definition of ethnographic film has been debated and contested over the course of the past 3 decades. While filmmakers such as Karl Heider contend that all films convey ethnographic information, others like Jay Ruby argue for the label to be restricted to only those films with anthropological intent and made by trained, "card-carrying" anthropologists. Largely ignored by both documentary filmmakers and cultural anthropologists, the nebulous terrain of ethnographic film has historically occupied a "no man's land." This is exacerbated by the fact that the best known ethnographic films are made by filmmakers with little or no anthropological training. For these reasons, Ruby has vociferously advocated the transition from ethnographic film (films about culture) to a filmic ethnography (films made with a specific anthropological intent).

In spite of the continuing debate about the theoretical underpinnings and methods that constitute ethnographic film, a canon has emerged that focuses on documentary-style films whose subjects include traditional anthropological subjects. This canon incorporated the early documentary films of Robert Flaherty (*Nanook of the North*, 1922) and Edward Curtis (*In the Land of the War Canoes*, 1914). These examples led to a canonization of ethnographic film that established itself primarily through the vehicle of "observational cinema," as exemplified by Margaret Mead's early work, such as *Trance and Dance in Bali* (1952) and *Bathing Babies in Three Cultures* (1951). Ethnographic film here was assumed to be the objective and detached use of film as documentary evidence, and it was implemented in "salvage ethnography," the purported mission being to visually capture and preserve tribal cultures before they disappeared forever.

The work of Jean Rouch and the influence of cinema verité widened the dialogue to showcase ethnofiction, in an attempt to draw attention to the highly constructed nature of film and the role of the camera and the filmmaker in the production. Robert Gardener began to employ film as a research technique, emphasizing the importance of a filmic record to the ethnographic enterprise. Tim Asch's legacy of pairing filmmakers with anthropologists to capture and create documents for conveying and studying culture influenced the corpus of recent ethnographic work. Asch's work with John Marshall among the Dobe Ju'/Hoansi may be among the most frequently viewed ethnographic films.

Recent work in ethnographic film has become more reflexive, removing observational cinematic techniques and voice-of-God narration in favor of more experimental filmmaking modes, often drawing from Jean Rouch and avant-garde cinema. Harvard University's Sensory Ethnography Lab and the Granada Centre at Manchester University in the United Kingdom have produced many new works exploring a more phenomenological and reflexive approach to ethnographic film, such as Lucien Taylor's *Sweetgrass*.

Indigenous Media

During the past 3 decades, a paradigmatic shift has occurred in the relationship between the filmer and the filmed. Popularly referred to as the "crisis of representation," serious discussion has revolved around who has the responsibility and the legitimacy to represent others. In other words, *who has the right to represent whom?* More specifically, who can represent whom, for what purposes, under what conditions, and for which audiences, and most important, in what ways do these representations matter to those who are being represented?

Ethnographic filmmakers had been grappling with these types of questions for years. Indeed, the "right to film" *preceded* the "right to write." As a result, ethnographic film is no longer the sole domain of the White middle-class male. Other historically oppressed voices are striving for expression, and the opportunity now exists to learn from and engage with the ways in which "women/native/others" choose to represent themselves. Indeed, the emergence of indigenous media is inextricably bound to the processes of decolonization and globalization.

As indigenous groups seize greater control of the visual media, they are invariably altering traditional anthropological representations of themselves and reconceptualizing the relationship between subject and object. One perspective, advanced by Ruby, states that the development of indigenous media

has meant that the era of the objectified film version of someone else's reality has officially come to an end. He argues that indigenous media can be seen as evidence of the inadequacy of the dominant anthropological paradigm and as a challenge that must be met in the reformulation of ethnographic film. To survive, Ruby recommends that ethnographic filmmakers must find a new relationship to the subject, which may entail finding a new subject altogether.

In contrast, Faye Ginsburg argues that indigenous media should not displace ethnographic film. She contends that the two can harmoniously coexist as separate and distinct entities. Ginsburg uses the metaphor of the "parallax effect" to describe the epistemologically positive impact that indigenous media can have on ethnographic film. This parallax is created by the different perspectives in media practices that can potentially offer a clearer vision of the multiplicity of points of view through which culture is "produced, contested, mediated, and reimagined." Instead of displacing ethnographic film, indigenous media resituates it by calling attention to the presence of other perspectives.

The voices of indigenous peoples is a new and growing force in the collective imagination of anthropologists. Although Westerners may not expect such peoples to write anthropological monographs, they have done so, and today, they also present us with visual texts made in film and video. This growing indigenous agency informs the various efforts by indigenous groups, large and small, at self-portrayal and the politics generated as a consequence.

These efforts—born, in part, of the collaboration between anthropologists and local societies as well as the independent activities in different societies—address the practice of producing videos for both internal and external consumption. By looking at these efforts, we are forced to appreciate how different agendas for video production may arise in societies that have different worldviews and social objectives. They also contribute to new alliances between indigenous societies separated by language, continental distances, and differing nation-state regimes and make for new alliances between these Fourth World peoples and First World peoples, especially in domains of ecological and environmental concerns and the sharing of cultural products, primarily music.

The discipline of visual anthropology must embrace this reality as a central recognition of its present subject and endeavor. These voices, primarily from the periphery, from the disadvantaged constituencies of power, and from the shadow of national and international spotlights, are now being heard more frequently and with greater clarity because of the emergence of new and affordable recording video technologies and the dynamic dissemination and distribution platforms of the Internet, in general, and YouTube, in particular.

Emerging Areas of Inquiry

New Media

The advent of the Internet connected users from around the world by enabling instant communication with the click of a mouse. To be sure, technology has reduced the significance of physical distance. With millions of video producers and consumers, user-generated websites are reshaping the way people engage with the media.

Thus far, anthropologists have been slow to seriously investigate what is perhaps one of the most pervasive cultural and technological practices of our time: Youtubification. Youtubification, a cultured technology spawned and sustained by the new media of the Web 2.0 revolution, refers to user-generated video content and its placement on the Internet site YouTube for communication and entertainment. With 2.5 billion videos viewed worldwide and hundreds of millions of hits per day, YouTube is more than just a technology for circulating images. It is an apparatus that is enabling users and groups to short-circuit the cultural and political categories that have been manufactured to contain and domesticate them, contest socioeconomic marginalization, and provide alternate readings of historical and cultural narratives.

YouTube presents central ideas of selfhood, identity, the recognition of social hierarchy, kinship structures, statuses, and power differentials in radically new ways. There are emerging translucent vocabularies of seeing alongside didactic ways of seeing that are comprehensible to varied viewer-consumer constituencies who are domesticators of this stimulus. It is important to understand how the World Wide Web is used by these constituencies to mobilize, advertise, and congregate in the pursuit of common goals. Periscoping above national, impenetrable walls of language and geography to engage in an exchange of ideas with outsiders and engage in trade

in products and services, the audiovisual YouTube holds "power constituencies" accountable in ways that are entirely unprecedented. Empowerment is not to be understood as being limited to access to political power and economic resources only but must also include the visibility garnered by formally invisible peoples. Indigenous authors and producers are increasingly offering their art, music, performances, and rituals to the public and are expecting that they will be appreciated as much as those produced by more mainstream media.

This exchange and communication occurs in novel ways. We must recognize the need for the acquisition of new technological skills and develop new tools and methods for visual anthropologists who wish to study the various new societies and resources of the virtual worlds of the Internet and You Tube, especially the emergence of indigenous authors.

A second issue concerns the already existing media. It is a matter of social justice that ethnographic recordings held in higher education institutions should be made available to the communities whose activities they preserve. With appropriate planning and care by researchers, digitization of research recordings in audiovisual media can facilitate access by remote communities to records of their own cultural heritage. Web 2.0 technology enables the opportunity to utilize digital representations of data to facilitate access by the subjects recorded and their descendants in a way that was not previously possible with analog recordings. Our hope is that this collaboration will serve as a model for our colleagues to follow, as more and more historically marginalized peoples are gaining the skills, technology, and need for a fuller understanding of their own past as well as a means to articulate their present and future.

Museum Anthropology

Over the past 30 years, a debate has developed within anthropology over the analysis and critique of museum displays. This work has focused on the politics of representation, the ethics of collecting cultural property, and debates about museum collections. Within anthropology, this work has attempted to provide theoretical tools to understand the relationship of museums to the cultures represented within the exhibits, as well as museums' relationships to the visiting public, for whom those objects are displayed. Recent work such as that by Mary Katherine Scott, Aaron Glass, and Kate Hennessey looks at the power of museums as sites of authority and agency in identity and community construction in visual anthropology.

Interdisciplinary projects engaging anthropologists, artists, and art historians test the boundaries of exhibition space through recent projects such as Ethnographic Terminalia, a curatorial collective that hosts an annual exhibition of international artists and researchers working at the intersection of art and anthropology. The collective explores the boundaries of anthropology and contemporary art through exhibitions that juxtapose the two. Ethnographic Terminalia exhibitions have been run in tandem with the American Anthropological Association's meetings since 2009 and work to "develop generative ethnographies that do not subordinate the sensorium to the expository and theoretical text or monograph," drawing greater attention to the process of ethnographic display.

VOLTAIRE

Voltaire (1694–1778), born François-Marie Arouet, was one of the leading *philosophes* of the French Enlightenment. Best known for his caustic wit and his ferocious anti-clericalism, he fulminated eloquently against intolerance. Paradoxically, he was thoroughly anti-Semitic, attributing the roots of Christian intolerance to its Jewish heritage. His most famous works are his satirical novellas, especially *Candide*, although these constituted a very small and, in Voltaire's own eyes, minor portion of his voluminous literary output, which also included poetry, tragedies, works of history, pamphlets, and letters. His contributions as a historian were considerable. His attempt at universal history, *Essai sur les moeurs et l'esprit des nations* (Essay on the Customs and the Spirit of Nations), took serious notice of non-European, especially Asian, nations. At a time when European Sinophilia was definitively on the wane, Voltaire remained a great admirer of Asian societies, especially China. He is often characterized as a relatively superficial thinker compared with some of his contemporaries, notably the Comte de Montesquieu and Jean-Jacques Rousseau. Nevertheless, his work includes very perceptive critiques of these authors.

Voltaire's most famous work, *Candide* (1759), is a ferocious satire condemning the intolerance of the Roman Catholic Church, the brutality and futility of war, and the stupidity and complacency of the aristocracy. The naive hero travels the world, enduring one horror after another, while clinging to the teachings of his companion in misfortune, the philosopher Pangloss (a caricature of Gottfried Wilhelm Leibniz), who expounds that all is for the best in the best of all possible worlds. In South America, he stumbles across the hidden utopian realm of El Dorado, very loosely based on the Inca empire of Peru, a kingdom of peace, justice, and order, which contrasts with sordid European realities. In the end, disabused of all his illusions, he decides to withdraw from the world and cultivate his own garden in Constantinople. For Voltaire, Turkey seemed a far more tolerant place than western Europe.

Other novellas and dialogues frequently used non-European settings or characters as foils for European foibles. *The Ingenu* (1767) is the story of a "Huron" (actually the long-lost scion of a Breton nobleman, Voltaire's idea of a European "savage"), who is promptly baptized on his arrival in France, only to fall in love with his godmother, with whom marriage would be considered incestuous. The trope of the "savage" who embodies "natural" wisdom and good sense was hardly original but had been pioneered in dialogue form by the Baron de Lahontan in the beginning of the century before being artfully adopted by Denis Diderot as well as by Voltaire.

Essai sur les moeurs (1756) was a more serious work, a universal history conceived as a retort to *Discourse on Universal History* (1681) by Bishop Jacques-Bénigne Bossuet. Voltaire condemned Bossuet's history not only as theocentric but also as Eurocentric, although Bossuet's account dwells extensively, and by no means derogatorily, on the Egyptian and Assyrian empires. Such places were still considered (relatively) within the European orbit. Rather, Voltaire was incensed by the exclusion of China, whose dynastic annals seemed at the time to date further back than any other known written accounts. The longevity and comparative stability of the Chinese empire eclipsed any European equivalent, even the Romans. Like the Jesuits, from whom he drew most of his information on China, he was a great admirer of Confucian morality. Still, despite Voltaire's attempt to take China and other Asian empires seriously, his history remains only slightly less Eurocentric than Bossuet's.

Voltaire's admiration for Asian empires, along with his visceral distaste for the aristocracy, led him to formulate an elaborate and cohesive critique of Montesquieu, whose work he nonetheless admired. He applauded Montesquieu's defense of liberty, not to mention his anti-clericalism. On the other hand, as a historian, he deplored Montesquieu's cavalier attitude toward his sources, particularly his readiness to distort them to prove whatever point he wanted to make. (Arguably, Voltaire the polemicist, if not the historian, can be accused of comparable distortion.)

Voltaire's most penetrating critique was to call into question the very concept of "despotism" central to the argument of the *Spirit of Laws*. No realm, and certainly no empire, could be subject to the whims of a single individual but instead must rely on an elaborate administrative machinery and, indeed, as Voltaire rightly insisted, on bodies of law to which rulers as well as subjects were bound. China, Persia, or Turkey were certainly not nations without laws. Admittedly, Voltaire conceded, exceptional monarchs in Asia or Europe might manage to exceed their legal authority, but these were exceptions that proved the rule.

Voltaire's critique was predicated on broader political differences with Montesquieu. Montesquieu's depiction of abusive central authority in China or Persia was meant to demonstrate the evils of a system that lacked an aristocracy to hold the monarch in check. Voltaire's contention that these Asian empires were models of orderly government was intended as a demonstration that the aristocracy was superfluous. In the struggles between the monarchy and the aristocracy in 18th-century France, Voltaire and Montesquieu were on opposite sides of the fence. Their debates about Asian societies were, in fact, debates about French politics.

Voltaire was even more dismissive of Rousseau's model of an original asocial humanity, as depicted in *Discourse on the Origins of Inequality* (1755). Humans, Voltaire insisted, were intrinsically social. Any model of "natural" humanity that was not also social was artificial and pointless.

All in all, Voltaire was at his best—and sometimes at his worst—as a critic. His critique of the work of his contemporaries could be very astute and on the mark, but he never devised any original scheme of his own.

W

Wagley, Charles

Charles Walter Wagley (1913–1991), a Boasian-trained American anthropologist, Indigenist, and Brazilianist, is considered a pioneer in Amazonian ethnology and race/ethnic studies in the Americas.

Biography and Major Works

Charles Wagley grew up in Bonham, Texas, and Kansas City in a poor family headed by his mother. Despite many obstacles, including the onset of the Great Depression, he managed to attend the University of Oklahoma and then transfer to Columbia University, where he earned his bachelor's degree in 1936. Continuing his studies for a PhD in anthropology, Wagley took classes with Franz Boas, but it was his mentors Ruth Benedict, Ruth Bunzel, and Ralph Linton who had the greatest influence on him. With support from Bunzel, he conducted dissertation research in the highland Guatemalan community of Santiago Chimaltenango in 1937, leading to his doctoral degree in 1941.

Wagley was also motivated by Linton's interest in acculturation, and for his second ethnographic research, he sought to study a remote group experiencing rapid change. With the support of Heloisa Torres of the Brazilian National Museum and guidance from Alfred Métraux, Wagley journeyed up the Araguaia River in 1939 to study the Tapirapé. Although he published several articles from this research, his 1940 article "The Effects of Depopulation Upon Social Organization, as Illustrated by Tapirapé Indians" stands out as an early exemplar of demographic anthropology.

During his Tapirapé fieldwork, Wagley nearly died of malaria. He lost contact with the National Museum, which sent a team to find him. On the team was a young intern named Eduardo Galvão. The two became friends and developed a professional relationship that lasted until Galvão's death in 1976. As a student of Wagley at Columbia, Galvão became Brazil's first anthropology PhD. Galvão later played a crucial role in developing Brazilian anthropology.

In 1940, Wagley married Cecília Roxa, from a prominent Brazilian family. Through her family ties, he was able to maintain multiple connections with Brazilian intellectuals and literary figures of the era. In 1941, Wagley and Galvão conducted a second study of acculturation among the Tenetehara—resulting in the book *The Tenetehara Indians of Brazil* (1949). With the entry of the United States into World War II, Wagley was recruited to join Serviço Especial de Saúde Pública (the newly formed Brazilian public health organization) to aid efforts to improve the health of rural workers for the purpose of increasing the extraction of key wartime resources. Wagley worked in the Amazon with rubber tappers—setting up health posts and producing culturally appropriate educational materials on health and malaria prevention. His work—one of the earliest examples of applied medical anthropology—proved of such value that the Brazilian government presented him with the prestigious Medal of War and named him to the National Order of the Southern Cross (an honor given to foreigners in recognition of significant service to the nation).

After the war, Wagley resumed teaching at Columbia—eventually becoming the first Franz Boas Professor of Anthropology. He was an important figure in setting up area study programs in the United States (along with Robert Redfield) and became the first director of the Institute of Latin American Studies at Columbia. In 1948, Wagley, Galvão, and both their wives conducted research in one of the communities under Serviço Especial de Saúde Pública's wartime purview—Gurupá. Their collective efforts resulted in Galvão's dissertation and Wagley's classic 1953 ethnography of rubber tappers, *Amazon Town* (still in print at the time of this writing). In 1951–1952, Wagley teamed up with the Brazilian anthropologist Thales de Azevedo to lead the Bahia State–Columbia University Community Study Project. Wagley originally planned the project to parallel the cultural ecology focus of his colleague Julian Steward's project in Puerto Rico, but following a suggestion by Métraux, Wagley focused instead on race relations. The research resulted in the first comparative anthropological study of race relations in Brazil in Wagley's edited book *Race and Class in Rural Brazil* (1952). Building on the Bahian research, Wagley described the cultural area of Plantation America in his 1957 article "Plantation America: A Culture Sphere" (after criticism by Melville Herskovits, Wagley changed the label to "Afro-America"). In 1958, Wagley teamed up with his most prominent student and by then a colleague at Columbia—Marvin Harris—to coauthor the first-ever cross-cultural comparison of minorities—*Minorities in the New World: Six Case Studies*. In 1959, Wagley wrote his influential "Social Race in the Americas"—a foundational piece documenting the cultural construction of "race."

By 1962, Wagley turned his attention to Brazilian national identity in his *An Introduction to Brazil*. He patterned the book on his mentor Benedict's postwar study of Japan, *The Chrysanthemum and the Sword* (1946), although carefully including descriptions of regional, racial, and class diversity in addition to the unifying themes of Brazilian national culture.

In 1971, after being robbed in his New York City apartment elevator, Wagley decided to move to the University of Florida, where he remained for the rest of his life. Also in 1971–1972, he served as president of the American Anthropological Association. During his time at Florida, Wagley published his Tapirapé material (gathered from 1939 to 1965) in *Welcome of Tears: The Tapirapé Indians of Central Brazil* (1977). With the building of the Transamazon Highway, Wagley began what was to be his last project—training students to investigate the massive changes under way in the region. Foreseeing the value of cross-disciplinary research, he encouraged his students to supplement anthropological training with natural science, agricultural, and forestry coursework. His 1974 edited volume, *Man in the Amazon*, reflects this concern, which was also evident in his work to establish what eventually became the interdisciplinary center for Tropical Development and Conservation at the University of Florida.

Critical Contributions to Anthropology

Wagley was influenced by—and made important contributions to—a number of emerging theoretical and methodological approaches of the time. These include the aforementioned research on culture change and acculturation in Amazonia, as well as the expansion of the community study method to peasant communities following the lead of Redfield (notably in *Amazon Town*), contributions to Steward's cultural ecology approach—including the comparison of demographic collapse and cultural survival in Amazonia in "Social and Cultural Influences on Population in Two Tupi Tribes" (1951), and additions to the cultural area concept for Latin America through the description of Plantation America and Wagley and Harris's "A Typology of Latin American Subcultures" (1955).

In addition, Wagley's description of social race was a clear statement on the arbitrary nature of racial classifications—which in the Americas could be based on phenotype, descent, language, dress, wealth, social customs, and/or self-identification—and could change depending on the circumstances. His collaborative work with Harris on race relations and minorities, each groundbreaking approaches, greatly influenced Harris's later work on race and racism. Wagley's ecological focus and early demographic work also influenced Harris's conceptualization of cultural materialism—although the two parted theoretical (but not personal) company later on owing to Wagley's "persistent eclecticism," according to Harris. As a precursor to the anthropological turn to globalization, Wagley's works contained insightful discussions of colonial and neocolonial domination and resistance—as seen in his

discussion of *aviamento*, or the debt-peonage system linking European industrial centers to lowly rubber tappers in his *Amazon Town*. Wagley also introduced innovative approaches to the study of kinship, acculturation, cultural ecology, and race/ethnicity to several generations of Brazilian scholars—in many ways matching the influence of his contemporary Claude Lévi-Strauss in Brazilian anthropology. According to some Brazilian scholars, Wagley is considered one of the founders of modern Brazilian ethnology.

Wallace, Alfred R.

Alfred Russel Wallace (1823–1913), British naturalist, evolutionist, geographer, anthropologist, and reformer, was a central figure in the emergence of the theory of evolution by natural selection, an important contributor to several other natural history and social science subjects, and an influential social critic.

Biography

Wallace was born on January 8, 1823, at Usk, Monmouthshire, Wales, the son of middle-class but not well-off English parents who had moved to Wales a couple of years earlier. They returned to England (Hertford) when Wallace was 5 or 6, and his only formal schooling took place there. A final financial collapse in late 1836 broke up the family, and young Alfred was forced to leave school. For the next 10 years, he worked as an apprentice in the surveying, building, and mapmaking trades, though, during a slow period in 1844–1845, he also taught elementary classes at a private school in Leicester. Meanwhile, he had begun to take an interest in collecting natural history specimens, especially after 1844, when he met Henry Walter Bates, another prominent naturalist-to-be, in Leicester. In 1847, the two decided to mount a natural history collecting expedition to the Amazon River basin.

They arrived in Brazil in April 1848 but soon split up, with Wallace concentrating on birds and insects of the central Amazon and Rio Negro. Wallace was already a committed transmutationist, but after 4 years in the Amazon, he had not recognized a mechanism that could explain evolutionary change. In poor health, he returned to England, but on the way, his ship caught fire and sank, taking 2 years of his collections down with it. Wallace and the crew were rescued 10 days later. Luckily, his collections were insured, and this permitted him to continue on with his researches 18 months later, this time in the East Indies (then known as "the Malay Archipelago").

Starting in Singapore in April 1854, Wallace had fabulous success over the next 8 years, sending home more than 125,000 specimens, again mainly of birds and insects, and recording important details of the region's faunas and peoples. While in the field, he wrote and published three seminal papers: (1) in 1855, "On the Law Which Has Regulated the Introduction of New Species" (an early evolutionary tract considered one of the first modern biogeographical studies); (2) in 1858, "On the Tendency for Varieties to Depart Indefinitely From the Original Type" (the "Ternate" natural selection article that sent Darwin scurrying to complete his *On the Origin of Species*); and (3) in 1859, "On the Zoological Geography of the Malay Archipelago" (outlining his discovery of "Wallace's Line," the most famous biogeographical boundary).

On returning home in the spring of 1862, Wallace settled down to a long career of writing, lecturing, and irritating any social institution that he felt was trampling on the rights of ordinary

people. Until about 1881, his emphasis was natural history, especially biogeography and evolutionary theory. During this period, Wallace wrote four legacy-generating books: *The Malay Archipelago* (1869), *The Geographical Distribution of Animals* (1876), *Tropical Nature and Other Essays* (1878), and *Island Life* (1880). His attention then gravitated more toward social issues, beginning with land reform but eventually extending to political institution reform, monetary policy, anti-vaccinationism, labor problems, and other topics. In 1889, he published the highly successful book *Darwinism*. Later in life, he became interested in astronomy, with his books *Man's Place in the Universe* (1903) and *Is Mars Habitable?* (1907) tackling subjects that are still of interest today.

Wallace married Annie Mitten in 1866, and together they had three children. Except for a few short trips to Europe and a lecture tour around North America in 1886–1887, Wallace stayed close to home after 1862. He remained active to the end, publishing two further social criticism tracts in his final year (at the age of 90). Wallace was well honored during his lifetime with two honorary doctorates, Royal Society membership, several major medals, and the Order of Merit. Wallace died peacefully at his home in Wimborne, Dorset, England, on November 7, 1913, several months before the onset of the First World War.

Wallace's Anthropology Work

As an anthropologist, Wallace is best known for his work in physical anthropology. His observations on Amazon monkeys yielded an important early theory relating speciation to the influence of river barriers; a few years later, he famously studied the field habits of orangutans on the island of Borneo. In 1864, his milestone paper "The Origin of Human Races and the Antiquity of Man Deduced From the Theory of 'Natural Selection'" became the first important treatment relating natural selection to race differentiation. Later, some of his theories on racial origins became influential.

Still, one might argue that his contributions to social and cultural anthropology are just as interesting, if not as well-known. Wallace explored all aspects of evolution, from astronomical cosmology to human social systems. His earliest writings are on subjects such as the uses of varied forms of knowledge, mesmerism, improving library collections and environs, emigration, the perils of national isolationism, and the daily affairs of Welsh farmers—all completed years before his first scientific publication in 1850. Wallace's two books from his Amazon travel days are heavily ethnographic. *A Narrative of Travels on the Amazon and Rio Negro* (1853) includes an appendix of native vocabularies, a separate chapter on aboriginal ethnography, and plentiful accounts of their daily routines, while *Palm Trees of the Amazon and Their Uses* (1853) plies an ethnobotanical course.

Wallace's Australasian studies also had a strong ethnographic side. He paid special attention to residents' spiritual beliefs, local economies and technologies, relations with colonial authorities, racial affinities, moral persuasions, and, once more, vocabularies. Much of this observation is thoughtfully condensed in his *The Malay Archipelago* (1869), one of modern history's great masterpieces of regional description. Later in life, Wallace used his knowledge of tropical peoples to regularly criticize both institutional treatments of them and his colleagues' often racist appreciations. In a 1906 article, for example, he condemned society's selfish treatment of the Polynesians, concluding, "What we have actually done, and left undone, resulting in the degradation and lingering extermination of so fine a people, is one of the most pathetic of . . . tragedies" (p. 182).

It must not be overlooked that Wallace was one of his period's most vocal spiritualists. In a letter in 1866 to T. H. Huxley (the same year Wallace was made the first president of the Anthropology Department at the British Association for the Advancement of Science meetings), he characterized spiritualism as "a new branch of Anthropology." In Wallace's view, material change organized by rote under natural selection was augmented by intelligent spiritualistic influences.

Wallace's Legacy in Anthropology

Having for many years been cited as the "Grand Old Man of Science," Wallace was possibly the most famous scientist in the world in his old age. Wallace's general renown beyond scientific circles would not have been possible without his increasing attention to social issues as he aged. Two early events established this trajectory: (1) at the age of 14, he fell in with a group of followers of the

utopian socialist reformer Robert Owen, who would later inform his approach to social organization, and (2) later, in the 1850s, he read Herbert Spencer's *Social Justice*, which profoundly affected his views on fairness within social institutions. He was also impressed early on by the ideas of George Combe, Robert Dale Owen, John Stuart Mill, and Emanuel Swedenborg.

These influences, added to his middle-class upbringing and years among primitive peoples, gave Wallace a rather unique worldview. He was one of the least racist of all 19th-century investigators, believing that, on average, less technologically advanced peoples' ethical and moral standards were not inferior to those held elsewhere. He also considered aboriginal peoples to be on a par intellectually with Europeans, although lacking the education to optimize those skills. His general philosophical position might be described as "socialist-libertarian": He believed in collective organizing for the common good, but not at the expense of overbearing forms of governmental control.

Wallace had no academic affiliations or students. But, as an engaging and forceful writer in his later years, his opinions on social and moral issues were in constant demand. Many of his diatribes on matters such as militarism, women's rights, eugenics, missionary work, colonial politics, imprisonment, the plight of the poor, immigration, and institutional religion remain fresh sounding even today. Indeed, his positions have been cited as squarely foreshadowing the "liberal agenda" program of the following century. In a 2010 article, K. B. Lowrey went so far as to identify Wallace as an ideal "ancestor figure" for contemporary anthropology.

Wallace, Anthony F. C.

Anthony F. C. Wallace (1923–) is a Canadian American anthropologist and ethnohistorian. The author of 10 books as well as numerous articles and technical reports, he is particularly known for his contributions to psychological anthropology, theory of revitalization movements, and other cultural innovations and for his many historical studies of American Indians and the Industrial Revolution in the United States. He was a professor of anthropology at the University of Pennsylvania for most of his career, as well as director of clinical research at the Eastern Pennsylvania Psychiatric Institute. In 1972, Wallace was made president of the American Anthropological Association. In 2013, he was honored with the Lifetime Achievement Award from the Society for Psychological Anthropology.

Wallace was born in Toronto, Canada, and grew up in Pennsylvania, where he collected Pennsylvania Dutch witchcraft stories and visited an Iroquois reservation to interview leaders of the Handsome Lake religion with his father, the folklorist and historian Dr. Paul A. W. Wallace. Following service in the army in World War II, he completed his undergraduate and graduate studies at the University of

Pennsylvania, where he earned his PhD in 1950. As an undergraduate, he studied physics and history; for his graduate studies, he chose the interdisciplinary field of anthropology. His mentors were two students of Franz Boas: Frank G. Speck, an eminent scholar of northeastern Algonquian and Iroquoian Indians, and A. Irving Hallowell, a formative figure in psychological anthropology; he also studied with Loren Eiseley, the author of widely read books on human evolution.

These intellectual influences are evident in Wallace's commitment to grounding human behavior and cultural processes in biology, psychology, ecology, and history. As he writes in the conclusion to his 1961 (second edition, 1970) work, *Culture and Personality*, his approach is "as all scientific explanations must be—unashamedly reductionistic" because "culture is an open system"; he opposes views of culture as a superorganic phenomenon divorced from biology and psychology. Yet, in that work and elsewhere, he also criticizes the type of scientific work in which a single limited method is followed and "the richness of human experience is not savored." Throughout his career, he alternated between detailed narrative histories and systematizing cross-cultural explanations like that of Frazer's *The Golden Bough*, which Wallace read while he was in the army.

Native American Studies

Some of Anthony Wallace's best-known work focuses on interactions between Native Americans and White Americans in the 18th and 19th centuries. His MA thesis, published as *King of the Delawares: Teedyuscung 1700–1763*, initiated a theme he had explored for many years: the psychological effects of White Americans' unscrupulous land grabs and cultural denigration of American Indians. His most widely cited work on this theme is his 1969 book (with the assistance of Sheila Steen), *The Death and Rebirth of the Seneca*. In it he describes the precolonization Seneca society and personality, including their sophisticated psychological understandings of dreams as revealing unfulfilled wishes. He then portrays the demoralizing effects for the Seneca of being confined to reservations and ends with the story of the prophet Handsome Lake, whose visions in 1799 led to personal transformation and a religious movement that initiated adaptive cultural change. An influential early ethnohistorian, Wallace also published *The Long, Bitter Trail: Andrew Jackson and the Indians* in 1993 and *Jefferson and the Indians: The Tragic Fate of the First Americans* in 1999. Anthony Wallace worked for several Indian nations as a researcher and expert witness on land claims in the 1950s.

The only monograph of Wallace's based on field research was his doctoral dissertation, published as *The Modal Personality Structure of the Tuscarora Indians as Revealed by the Rorschach Test* by the Bureau of American Ethnology in 1952. In it Wallace criticizes the then common method of inferring national character from cultural practices instead of objective psychological measures. Rather than averaging the Rorschach scores of his participants, as others had done, he determined the most common profile, the modal personality structure (a term he took from Cora DuBois), which he found in just 37% of his sample—a result that was surprising given some of the uniformitarian culture and personality theories of his time. He concluded that although socialization experiences are influenced by cultural expectations, and hence tend to be similar in a society, individual personality was the result of personal experiences rather than being molded by culture and, like fingerprints, was unique to an individual.

Psychological Anthropology

Wallace made numerous contributions to the field of culture and personality (later known as psychological anthropology). One is his concept of the *mazeway*. Drawing on Edward Tolman's proposal that rats develop a cognitive map of mazes and are not just responding to stimuli, as well as on work by Hallowell and others, Wallace proposes in a 1956 article, "Mazeway Resynthesis: A Biocultural Theory of Religious Inspiration," that every person builds representations of his or her world that include goals, plans for achieving the goals, and ideas about self and other people and objects. His conception of the mazeway as a probability distribution of associated patterns presages more recent neural network models of cognitive schemas. In other articles (e.g., "The Meaning of Kinship Terms," coauthored with John Atkins), Wallace criticizes semantic analyses that predict how terms are applied but lack "psychological reality."

If each person's mazeway is somewhat different from everyone else's, what is the relation among the personalities in a society? In the 1961 introduction to *Culture and Personality*, Wallace proposes that culture can be thought of not as a "replication of uniformity" but as an "organization of diversity," a way for "individuals to organize their strivings into mutually facilitating equivalence structures," which are predictable patterns of behavior among people who have complementary roles. Members of a group do not need to share mazeways in order to meet each other's needs. Wallace seems to be interested in diversity not only due to his study of the differences among personalities in any society but also because of his concern about subordinated groups. In the preface to *The Long, Bitter Trail*, Wallace urges governments to "find ways of organizing diversity instead of trying to remove it."

In the 1956 "Mazeway Resynthesis" article, Wallace also addresses mental illness and religious inspiration. Using the example of the visions of Handsome Lake, Wallace argues that for healthy psychological functioning, an individual's mazeway must try to maintain satisfactory levels of internal communication, consistency, and correspondence with reality, although we abandon old perceptions with difficulty and thus tend to accumulate inconsistent elements in our mazeways. Situational factors such as bereavement, natural disasters, or other social changes can disrupt mazeway adjustment and create stress. Chronic mental illness may be due to physiological breakdown of normal processes of mazeway repair. Changes in adrenalin metabolism could help bring about religious visions, which in turn lead to a rapid reorganization of the mazeway, restoring equilibrium and reducing stress. This account is original among anthropological accounts of its time in taking religious visions to be therapeutic rather than pathological and in giving a biocultural rather than psychodynamic explanation of mental illness.

Wallace continued to use some psychodynamic concepts throughout his career; for example, in his 1987 *St. Clair: A Nineteenth-Century Coal Town's Experience With a Disaster-Prone Industry*, he proposes that 19th-century mine owners scapegoated careless miners as a defense mechanism against their guilt over inadequate mine safety. The psychoanalytic element of his theories diminished over time, however. In the introduction to *Culture and Personality*, he criticizes contemporary Freudian anthropologists for their failure to follow Freud in grounding clinical psychology in neurology, biology, and experimental psychology.

Revitalization and Religion

In 1956, Anthony Wallace also published his most cited work, "Revitalization Movements." He defines revitalization movements as "a deliberate, organized, conscious effort by members of a society to construct a more satisfying culture." The movement could be religious (e.g., the Ghost Dance, early Methodism), political (e.g., Nazism), or a mix of those. Whatever be the type of revitalization movement, it results in rapid cultural change that is deliberately intended, instead of the more commonly observed process of slow, unintended change.

Wallace postulates that a revitalization movement arises when events such as military conquest, cultural and political subordination, epidemics, or economic dislocations create chronic stress. One of the individuals under this stress undergoes mazeway resynthesis and then converts others to his or her new vision for the culture. If they are successful, cultural transformation occurs. The process of mazeway resynthesis is not only a key causal element in revitalization movements, it is also a model that Wallace believes is replicated on the societal level. He uses the analogy of society as a kind of organism that tries to maintain homeostasis by taking special measures "to preserve its own integrity" when under stress. Wallace does not comment on the seeming discrepancy between this organismic view of society and the more loosely coordinated "organization of diversity" view he put forward during the same period.

In 1966, Wallace published *Religion: An Anthropological View*, in which he summarizes leading anthropological theories of religion, proposes fundamental patterns of behavior that are common to all religions, and discusses some of the functions of religion, including mazeway resynthesis through visions and rituals. Unlike structural-functionalists, who highlighted the conservative function of religion in reinforcing social structures, Wallace drew on his work on revitalization movements to stress that religious visions can also lead to sociocultural change.

Cultural Innovation

Wallace extended his interest in ethnohistory and social change to examine the effects of scientific

and technological innovation. Inspired by Thomas Kuhn's discussion of paradigm shifts in science, Wallace investigates the way the solutions to technical problems instigate thoroughgoing change in the culture of a group, just as the fieldwork method changed the discipline of anthropology. *Rockdale: The Growth of an American Village in the Early Industrial Revolution*, published in 1978, uses the anthropological method of a community study as a lens to portray the social effects of the Industrial Revolution. It also narrates a 19th-century struggle between Enlightenment freethinkers and evangelical Christians, a dialectical struggle of opposites that resulted in the distinctively American synthesis of Christian industrialism, which held that proper stewardship of wealth would produce economic growth for all and equalize social conditions. *Rockdale* was awarded the Bancroft prize in American history (in 1979) and was a finalist for a Pulitzer Prize. A companion study to *Rockdale*, *St.Clair*, shows the failure of 19th-century mine owners to respond realistically to coal mine conditions in that Pennsylvania town and draws conclusions about why some organizations are disaster prone. Wallace draws together a variety of case studies in *The Social Context of Innovation: Bureaucrats, Families, and Heroes in the Early Industrial Revolution as Foreseen in Bacon's New Atlantis*. In that work, Wallace describes some of the social and institutional structures necessary for technological innovation. He disputes that Protestantism was a necessary condition. Although Wallace shares Max Weber's concern with the role of religion in social change, the particular conclusions Wallace drew did not replicate Weber's.

In recent years, Anthony Wallace's many contributions to ethnohistory were noted in a lengthy interview published in the journal *Ethnohistory* (1998). Similarly, the influence of his conception of society as an "organization of diversity" was examined in a 2009 special issue of *Ethos* ("The Organization of Diversity: Developmental Perspectives," edited by Ryan Brown and Harold Odden). Wallace contributed an epilogue to that special journal issue, in which he tied together his interest in the diversity of personalities and roles in a society with his interest in intellectual diversity and social change.

Throughout his career, Wallace also contributed to policy discussions and civil rights. In addition to his work on behalf of Native American land rights, he wrote about the negative effects of high-density public housing ("Housing and Social Structure"), analyzed psychological reactions to disasters, and argued early on that homosexuality should not be considered a mental illness. He spoke against anthropological involvement in counterinsurgency intelligence gathering and for human subjects protections for mental patients.

Wallerstein, Immanuel

Immanuel Maurice Wallerstein (1930–) is one of the most influential social theorists in recent decades. Wallerstein's approach to world history, which he calls the "world-system perspective," has had a wide and deep impact throughout the social sciences and humanities.

Intellectual Development

Wallerstein was born in New York City on September 28, 1930. He earned his BA (1951), MA (1954), and PhD (1959) at Columbia University, where he taught until 1971. Columbia housed outstanding intellectuals such as Karl Polanyi, Lionel Trilling, Richard Hofstadter and C. Wright Mills. Later, Wallerstein's intellectual development advanced from New York City to Paris, Ghana, and the Ivory Coast. While in Paris, he became familiar with the work of the Annales school, a legacy of the historian Fernand Braudel. He also worked with Georges Balandier, a French sociologist, anthropologist, and ethnologist who focused on African colonialism.

As an undergraduate at Columbia, Wallerstein took classes from C. Wright Mills during the period in which Mills was writing *The Power Elite*. Mills was disaffected with the predominant theoretical and methodological approaches in sociology (abstracted empiricism and grand theory). Wallerstein, like Mills, was disaffected, helped create a new way of looking at society, and hoped to renew the possibility of achieving human freedom.

For his dissertation, later published as *The Road to Independence: Ghana and the Ivory Coast* (1964), Wallerstein conducted research on the voluntary associations that led the West African independence movements. The work was based on interviews and surveys that Wallerstein conducted in the Gold Coast (later Ghana) and the Ivory Coast. His studies of the rise and demise of colonial regimes in Africa led him to conclude that one could not understand African history and social change without comprehending the historical and contemporary interactions among Africa, Europe, and the Americas.

Wallerstein was on the faculty at Columbia during the 1960s, an era of international student revolt, including the civil rights movement in the United States, the antiwar movement stimulated by the war in Vietnam, and a countercultural rebellion that made alliances with radical workers in France and Italy. Later, he called these sometimes connected, sometimes independent collection of movements "the world revolution of 1968." In 1971, he moved to McGill University for 5 years, then on to Binghamton University. There, along with Terence Hopkins, he founded the Fernand Braudel Center for the Study of Economies, Historical Systems, and Civilization. In the early 1990s, Wallerstein chaired the international Gulbenkian Commission on the Restructuring of the Social Sciences. In 2000, he became a senior research scholar at Yale. He is a past president of the International Sociological Association and has published more than 30 books and more than 200 articles and book chapters.

At Columbia, Wallerstein came to see intellectual and political projects as two sides of the same coin. He became interested in *dependency theory*, the idea that there is an international hierarchy that underdevelops the Global South. Dependency theory had emerged primarily among Latin American scholars such as Raul Prebisch, Teotonio Dos Santos, and Fernando Henrique Cardozo. It was popularized in the Global North by Andre Gunder Frank. Over the ensuing years, Wallerstein, along with Giovanni Arrighi and Samir Amin, used the concept of an evolving hierarchical global division of labor to analyze African development. Fruitful collaboration and debate among Frank, Amin, Arrighi, and Wallerstein continued throughout their lives.

Formulation of the World-System Perspective

Wallerstein and the dependency theorists argued that core-periphery relations went far beyond formal colonialism. He perceived that similar colonial-like relations had occurred between Poland and western Europe during the 16th century. He discussed this in detail in the first volume of *The Modern World-System*, published in 1974. The world-system perspective explains institutional changes from a focus on entire interpolity systems, in contrast to the usual social science focus on single-nation societies. Wallerstein argued that societies have always existed within larger interaction networks that shaped their histories. Long before globalization became a catchword, the world-systems perspective examined the nature of a world economy that linked a system of interacting polities. Wallerstein defined three kinds

of systems: (1) minisystems based on reciprocity, (2) world empires based on redistribution, and (3) world economies in which a number of states ally and compete with one another. World systems are composed of three components: (1) the core, which contains the most developed societies; (2) the periphery, which is composed of the least developed societies; and (3) the semiperiphery, which is composed of societies intermediate between core and peripheral societies. The relation of core societies to semiperipheral societies and of semiperipheral societies to peripheral societies is similar to the relations between colonizing and colonized states. A key difference is that all the three are part of one overall system. The word *world* means largely self-contained. Only in recent centuries has a single world system become planetary (Earth-wide). In short, it is a world. It is the semiperiphery that helps stabilize the overall system. Often semipheripheral societies are former core states that have been passed by more developed states, or peripheral societies beginning to develop more rapidly. While the core-periphery-semiperiphery structure is more or less constant, the positions of individual societies or states shift over time.

The world-systems perspective has come to encompass a number of bodies of research, historical narratives, and theories that seek to explain world historical social change. In short, it is a knowledge paradigm that contains many competing theories. The key insight of the perspective is that interaction networks (trade, information, and political interactions) have woven polities and cultures together for centuries. Thus, the entire interpolity system, or world system, is the central unit of social evolution. In this approach, what is commonly called globalization is only the latest manifestation of these processes of change.

A world system is a vitally connected interaction network, not merely international relations. The modern world system is a nested stratification system in which core polities (which compete with one another) dominate and exploit dependent peripheral and semiperipheral peoples. A few polities have been upwardly or downwardly mobile within the larger hierarchy, but most stay in the same position.

The evolution of the modern world system has been driven mainly by capitalist accumulation, the struggles among classes, and resistance from peripheral and semiperipheral peoples. The current semiperiphery includes large countries in the Global South (e.g., Mexico, India, Brazil, China, Indonesia) as well as smaller countries that have intermediate levels of economic development (e.g., South Korea, Taiwan, Israel, South Africa). Institutional change has been shaped by both the winners and the struggle of those who resist them. The modern core-periphery hierarchy is an asymmetrical division of labor between core producers of highly profitable commodities and controllers of finance capital, and peripheral producers of much less profitable goods. The semiperiphery is an intermediate zone. Wallerstein's key point is that national development can only be understood and explained by comprehending this core-periphery hierarchy.

Wallerstein argued that the modern world system emerged in the late 16th century (1560–1640), when Europeans first circumnavigated the globe and began colonizing and exploiting other continents. He contends that the Dutch hegemony peaked during the economic and demographic crisis of the 17th century. Then, Great Britain and France contended for hegemony in the 18th century. Britain eventually came to dominate the system in the 19th century. The United States rose to hegemony in the 20th century and is now in a phase of hegemonic decline.

So for Wallerstein, capitalism became predominant in the regional (European) world system in the 16th century. This system then grew larger in a series of cycles and upward trends and is now approaching the upper limits (asymptotes): (a) the long-term rise of real wages, (b) the long-term costs of material inputs, and (c) taxes. These long-term (over centuries) trends lead to a fall in the average rate of profits. Strategies combating these trends—automation, capital flight, acceptance of reduced wages to remain employed, and attacks on the welfare state and unions–slow down but do not eliminate the contradictions of capitalism. This will cause an irreconcilable structural crisis during the next 50 years, which will lead to the emergence of some other system after "The Age of Transition." The results of this transition are far from clear or fixed. Possibilities range from a global fascist state to some form of collectively rational egalitarian and democratic global governance.

Critiques of the World-System Perspective

There have been major critiques of Wallerstein's approach to world-systems analysis:

1. It ignores the particularities of different kinds of capitalism and discounts internal processes in national societies.

2. It neglects class relations and overemphasizes exchange relations.
3. It is too "economistic" and neglects politics and culture.
4. It fails to see a new global stage of capitalism.
5. It neglects the evolution of world systems before the emergence of the modern system.

Wallerstein has answered these criticisms in the prologue to the most recent (2011) edition of *The Modern World-System*, Volume 1.

Later Developments of the World-Systems Perspective

Several groups of scholars have attempted to modify and extend the analysis of the modern world system to precapitalist settings. They have sought to explain how and why the modern system emerged where and when it did in comparative world historical perspective and to understand earlier evolutionary transformations. Initially, Wallerstein was skeptical of such extensions, but more recently, he has come to see their value. Andre Gunder Frank and Barry Gills claimed that the modern capital-imperialist system emerged 5,000 years ago when states and cities came into being in Mesopotamia. Christopher Chase-Dunn and Thomas Hall proposed a comparative and evolutionary world-systems perspective, which contends that earlier regional world systems were usually multicultural networks of competing and allying polities. They also contend that long-term prestige goods exchanges sometimes played an important role in the reproduction of local hierarchies within regional systems. And they also examine the role of political-military interactions and the influences of information exchanges, including ideologies. These extensions have sparked considerable interest in, and new critiques of, world-systems analysis among archaeologists, anthropologists, world historians, and political scientists.

One obstacle to comprehending Wallerstein's argument is the time horizon, which for most people is far less than 50 years. Wallerstein is intentionally vague about what might replace capitalism. He argues that the declining hegemony of the United States and the crisis of neoliberal global capitalism are signs that capitalism can no longer adjust to its internal contradictions. Thus, the world is in a period of chaotic and unpredictable historical transformation. The new system might be an authoritarian global state that preserves the privileges of a global elite or an egalitarian system in which nonprofit institutions serve communities. Wallerstein agrees with those who argue that taking state power will not work, as happened in the Russian Revolution in 1917 and the decolonization movements. Wallerstein has become one of the leaders of the global justice "movement of movements," which emerged around the World Social Forum.

Though there have been many other contributors, Immanuel Wallerstein is the major founder of the world-systems perspective. Wallerstein's outstanding work as a historical sociologist and especially as a public intellectual demonstrates that social theory is not only for academics.

Weber, Max

Maximilian Karl Emil ("Max") Weber (1864–1920) was a key founder of sociology whose ideas have had an increasing influence on anthropology as anthropology has shifted away from its previous specialization in nonstate or marginal peoples.

Brief Biography

Max Weber is widely regarded as history's foremost sociologist. He came from a background of merchants and academics and deeply felt in his own being the psychology of the Protestant ethic of hard work that he so famously analyzed. His father was a minor conservative constitutionalist politician and *bon viveur*; his mother came from a line of rich merchants but was deeply committed to plain living and serious morality. Weber's doctoral thesis (1889) was on medieval trading companies, and his Habilitation thesis (1891) was on the agrarian system and laws of ancient Rome. In 1893, Weber married Marianne Schnitger, his father's elder brother's granddaughter, whose inheritance enabled the couple to set up independently of Weber's parents. The couple were devoted to each other and committed to equality of the sexes (in contrast, as they saw it, to Max's parents' relationship). Marianne, with Max's support, went on to become a well-known feminist scholar. They had no children (most Weber specialists assume that the marriage was never consummated).

In 1894, at the age of just 30, Weber became a professor of economics at Freiburg. After 2 years, he moved to a professorship in Heidelberg. Less than a year later, Weber had a major row with his father, which was never resolved. When his father died shortly afterward, Max went into a deep depression, had to take time off teaching, and eventually resigned his professorship in 1903. Following an extended trip to Italy and an influential 3-month visit to the United States, Weber began one of the most productive periods of his life, including writing *The Protestant Ethic and the Spirit of Capitalism* (1904–1905, revised 1919). He only returned to teaching in 1919, shortly before his death.

Weber was very much a public intellectual, deeply concerned with the big political issues of his day (including the First World War and its aftermath). He stood, unsuccessfully, for political office. To the end of his life, he wrestled with the moral questions of exactly how and to what extent a scholar should become involved in political action. Unlike Émile Durkheim, and despite the fact that he founded the German Sociological Association, Weber regarded himself primarily as a legal historian and a political economist rather than a sociologist.

Weber's main interests were the culturally embedded nature of economic action, the history of complex societies, and, particularly, the questions of the origins and uniqueness of the West. Because Weber had relatively little to say about small-scale, nonliterate societies, his influence on anthropology was slight. In more recent times, that has changed, but his influence for the most part has come mediated through the figures of Talcott Parsons and Clifford Geertz and latterly Pierre Bourdieu and Michel Foucault (see further below). A few modern anthropologists, such as Jack Goody and Eric Wolf, have taken up large-scale historical comparative themes of a Weberian sort without being strongly influenced by Weber himself. M. G. Smith was an exception in that he drew explicitly on Weber in his work on Nigeria and the Caribbean.

Major Works

The Protestant Ethic and the Spirit of Capitalism (*PE*) is arguably the most influential sociological text ever written. It was translated into English by Talcott Parsons and published in 1930. Parsons's is a highly readable, but also unreliable, translation. The famous image of the "iron cage," in which, in Weber's view, modern people are forced to live, seems to have been borrowed by Parsons from Bunyan's *Pilgrim's Progress* and inserted into Weber's text. In fact, Weber's German wording means "steel-hard casing," an even more depressing, though arguably less poetic, image in that it implies an inability to see out through the bars to alternative ways of living. New English translations by Steven Kalberg (2002) and by Peter Baehr and Gordon Wells (2002), much more careful than Parsons's, are now available and convey more accurately what Weber actually wrote.

Weber published many long essays during his lifetime, including comparative studies of the different

economic ethics of world religions. These appeared in English as the books *The Religion of India*, *The Religion of China*, and *Ancient Judaism* (a further study of Judaism, several studies on Christianity, and a projected volume on Islam were never completed). Some of his most important lectures on historical sociology, law, the state, and social methodology were also not published in his lifetime. His widow brought them together and published them posthumously as the three-volume *Economy and Society*. Parts of *Economy and Society* have appeared as separate books (e.g., *The Sociology of Religion*, *The City*, and *The Methodology of the Social Sciences*). His *General Economic History*, which examines the other (nonreligious) factors necessary for the emergence of capitalism (the rule of law, a relatively free market, a minimum level of scientific technology, free labor, double-entry bookkeeping, etc.,), was also put together from lecture notes after his death. It was the first of Weber's works to be translated in English, coming out in 1927.

The "Weber Thesis"

The "Weber thesis" is a claim about the relationship between Protestantism and capitalism. For a number of reasons, in the Germany of Weber's day, any claim to see a special link between the two was likely to stir up debate: (a) Protestant-Catholic relations in Germany were highly sensitive, and the predominance of Protestants in government and commerce gave rise to political and cultural tensions; (b) Weber's argument drew on and debated with already existing German scholarship on the origins of capitalism; and (c) *PE* also had implications for historical method and debates with Marxism (were religious outlooks simply a reflection of underlying economic relationships as Marx had argued, or could religious ethics have an independent influence on historical developments?).

There was yet another reason why the essay generated an enormous and polemical literature from the outset, a stream of publications that has barely halted to this day. Weber's own style of writing, not to mention his entire intellectual framework, is not easy to come to grips with. His long sentences, with many subordinate clauses and qualifications, are indications of his heroic attempts to do justice to enormous quantities of empirical material. The convoluted style goes with a powerful generalizing thrust that, despite the sheer mass of evidence he marshals, gives a remarkable unity to his thought.

Unfortunately, a considerable portion of the literature attacking Weber's *PE* is based on a fundamental misunderstanding of what Weber actually wrote. In *PE*, Weber begins—as a way of introducing the initial problem—by pointing out that in the Germany of his day Protestants outnumbered Catholics among the mercantile and entrepreneurial classes. Without reading any further, this initial statement of a *problem* has been mistaken for the *thesis* that Protestants make good capitalists and Catholics make bad ones (and this is then generalized by writers in other contexts to the assertion that Hindus, or Chinese, or Muslims [or others] make bad capitalists). Naively, Weber is assumed to be some kind of partisan cheerleader for Protestantism and its benign effects on capitalist growth and an opponent of all other forms of religion. Quantities of paper have been wasted digging up examples of Hindus, Catholics, Japanese, and others who are or were good capitalists, or even (occasionally) examples of Protestants who were poor capitalists. Thanks to this fundamental mistake in the interpretation of Weber's work, "Weberian" for many people means believing that economic change is brought about by cultural, religious, or psychological attitudes. This is quite contrary to what Weber himself thought, which was that most of the time religious ethics and other ideologies do *not* have an independent effect on people's actions. The Protestant ethic was, he believed, an exception in this regard.

What Weber was trying to do was to pinpoint the answer to a very specific historical question: Why did modern capitalism emerge only in northwest Europe, a part of the world that, from many points of view, was not particularly favorable to it? And why did it not appear in China or South Asia (India), which had many advantages that Europe lacked? Thus, evidence advanced about the success of East Asian capitalists in modern times is wholly irrelevant. The fact that particular religious outlooks may be highly compatible with capitalism, once the capitalist system is established "on mechanical foundations," as Weber put it at the end of *PE*, is not germane to the question of how that system emerged when no one knew what it was or could be. East Asian societies with strong Confucian values are evidently very well adapted to capitalist production once the advantages of capitalism are

plain for everyone to see and once state bureaucracies have embarked on deliberate policies to encourage "development." What Weber was interested in was a wholly different problem, namely, the first, unplanned, and endogenous emergence of the modern form of capitalism: That is, could modern capitalism have appeared first in East Asia?

Furthermore, as this implies, Weber was interested in one particular approach to capitalism, and the spirit of endless accumulation and hard work that went with it. Capitalistic activity could be and, he recognized, historically often had been carried out in a very un-Puritan spirit (e.g., "booty capitalism," when merchants invested in expeditions that sought to plunder enemies of the state). Weber undertook his comparative study of different civilizations to discover whether non-Christian religious traditions had the potential to produce analogs of the Protestant ethic, in other words ethics that could motivate economic behavior of a modern capitalist sort. Such behavior had four key features: It was active (not resigned or fatalistic), rational (in the sense of systematizing all areas of life to one end), this-worldly, and ascetic. Weber was highly aware of the paradox that the endless work and accumulation of the ascetic Protestant entrepreneur, banned from ever enjoying the fruits of his labor, was, from another point of view, supremely irrational.

Most religious paths for most of human history have failed to combine all four key characteristics. Buddhism, for example, offers a path that is moderately ascetic and capable of rationalization, but it is otherworldly and nonactive for its fullest adherents (i.e., those who become monks or nuns). In other words, in premodern understandings of Buddhism, those who follow the Buddhist path most fully do not engage in worldly action and are led away from any such involvement. Weber found only one religious tradition that was any kind of functional analog of Protestantism, namely, Jainism in India. It is indeed true that many Jains are highly successful merchants and industrialists. However, because of other aspects of the organization of South Asian society, the spirit of Jainism did not spread more widely (Jains were always a minority in a largely Hindu social field). Other factors specific to South Asia (e.g., the organization of scientific knowledge and the patrimonial state) also militated against the endogenous emergence of capitalism in South Asia, though some historians have argued against Weber's conclusions on this.

How Anthropologists Read Weber

Most anthropologists study Weber only as part of their introductory training in social theory. As a consequence, they associate him with one of two possible positions. In the first interpretation, Weber is thought to be a simplistic, positivist advocate of modernization theory and scientific rationality (contemptuous references to "Weberian rationality" as self-evidently misguided and ethnocentric are common). The second way of pigeonholing Weber is to identify him with Geertzian interpretivism, taking at face value Clifford Geertz's invocation of Weber as the patron saint of hermeneutics in the introduction to *The Interpretation of Cultures*. (Geertz [1973] famously wrote, "Believing, with Max Weber, that man is an animal suspended in webs of significance he himself has spun, I take culture to be those webs" [p. 5].) These two interpretations of Weber differ radically, but most anthropologists are not sufficiently interested to notice that they are radically incompatible. As in the parable of the blind men and the elephant, each interpretation grasps one small part of the complex whole that is Weber's thought and takes it as the master key.

Sometimes anthropologists engage with particular parts of Weber's oeuvre, as when they write about charisma, bureaucracy, or Buddhism. But when they do this, they rarely engage with Weber's major themes of comparative civilizational development, the uniqueness of modernity, the rise of individualism, and the relationship between economy and morality. Ironically, when they do tackle such themes, as was the case with Louis Dumont in his magisterial, if controversial, study of inequality and hierarchy in India, *Homo Hierarchicus*, and his subsequent studies of the economic ideology of Europe, they seem keen to disown any acknowledgment of Weber's influence. Weber belongs to sociology, so anthropologists on the whole avoid invoking him as a major theoretical influence. There are understandable institutional reasons for doing so, but it is none the less a pity that anthropology should retain such a deep imprint of its origin in the study of small-scale societies.

Thus, contemporary anthropology receives Weber's influence indirectly, primarily via two other

thinkers who were themselves deeply influenced by him: Pierre Bourdieu and Michel Foucault. Bourdieu built particularly on Weber's distinction between three different forms of stratification: political power, wealth, and status or prestige. Bourdieu attempted to provide much greater systematic consideration than Weber ever did to different forms of capital (social, economic, and cultural) and the degree to which they could be transformed from one to another. Bourdieu also shared with Weber an interest in combining a full account of external, objective forces constraining action and an understanding and appreciation of the internal, subjective motivations of individuals. Many writers in the social sciences content themselves with inhabiting one or the other side of this big divide. Bourdieu frequently claimed to have transcended it. However that may be, through the influence of Bourdieu and also Anthony Giddens, practice theory in anthropology attempts to encompass the big themes of power, resistance, class, and nationality, while still staying true to grassroots perspectives and ordinary people's conceptualizations. What Sherry Ortner, one of the most articulate exponents of practice theory, fails to realize, trapped as she is in her Geertzian view of Weber, is that these are precisely the themes that Weber himself grappled with in his political sociology and historical works.

Foucault has also had a substantial influence on anthropologists working today, particularly his notions of *governmentality* and *biopower*. (Foucault's term *governmentality* is an abbreviation of "governmental rationality.") Foucault's grand theme of the emergence of modern forms of the state, his interest in the ways in which the new institutions of modernity (the prison, the school, the hospital) oblige people to behave in certain ways and encourage concomitant changes in psychological attitudes and dispositions, can be seen as a development of Weber's interest in bureaucracy and what he called *rational-legal domination*. Weber's focus on the new kind of person brought into being thanks to the legacy of Protestantism has its parallels in Foucault's interest in "self-making" projects. Foucault's emphasis may have been more on *discourses* that are independent of particular agents; Weber thought more in terms of sets of *ideal types* (models, if you will) through which actors engage with and construct social reality. But with all due regard for the differences of the eras in which they wrote, and their different social and political positioning within their respective societies, the overall intellectual thrust of the two sociologists was very similar. They both shared a deep pessimism about the dehumanizing effects of modern rationalized forms of organization, though Foucault's views were perhaps bleaker and less nuanced than Weber's. Those anthropologists who have begun in recent years to engage with the state and bureaucracies or to invoke Foucault in their studies of hospitals or government health campaigns are, usually unbeknown to themselves, recovering many of Weber's themes.

Rationality and Ideal Types

Anthropologists often fail to appreciate that Weber allowed for different types of rationality and that different spheres of life could have their own canons of rational conduct. Civilizations could evolve in accordance with processes of internal systematization that were quite different from those of other cultures. Thus, Weber was unique among late-19th-century and early-20th-century sociological thinkers in breaking loose from the single-path evolutionist thinking ("All societies must pass through the same stages") that was taken for granted by his contemporaries. Furthermore, and importantly, Weber distinguished means-end rationality from value rationality. Thus, actions may be what anthropologists would call expressive, undertaken in accordance with a value and still rational in their way, even if they are not intended to bring about instrumental goals. Despite these relativizing moves, Weber was clear that instrumental rationality, thanks to the triumph of capitalism, was now fated to dominate the entire globe; an inevitable consequence was the gradual and inexorable disenchantment or "de-magicking" (*Entzauberung*) of the worlds in which ordinary people live.

Philosophically, Weber was deeply indebted to the German neo-Kantian philosophers of the second half of the 19th century, such as Wilhelm Windelband and Heinrich Rickert. All scientific enquiry is about developing adequate models of an ultimately unknowable reality; there is a fundamental difference, however, between natural science, with its universal laws and purely externalist attempt to grasp phenomena, and the historical sciences, which must combine model building with the attempt to understand the values, subjective

experiences, and viewpoints of the people being studied. It is in this context that his notion of *ideal type* must be understood: "ideal" not in the sense of "recommended" but meaning "abstracted" and "constructed." Actual historical and ethnographic cases will approximate more or less to the model or ideal type (e.g., of bureaucratic organization). Such a gap is entirely to be expected and does not, of itself, demonstrate that the model has no utility. Only the demonstration that, in the situation described, the ideal type also wholly fails to capture the worldview, values, or expectations of the actors would show that the model was inadequate.

Wenner-Gren Foundation

The Wenner-Gren Foundation for Anthropological Research, Inc., one of the major funders of anthropological research internationally, has played an important role in the discipline's development since the end of World War II. A private, operating foundation, it is dedicated to the support of all branches of anthropology, including biological, archaeological, linguistic, and social/cultural research on humanity's origins, historical trajectory, and contemporary diversity.

History

In 1941, the Swedish industrialist Axel Leonard Wenner-Gren established the Viking Fund as a charitable organization incorporated in the United States, funded with $2 million of stock in his company, the Electrolux Corporation. He appointed Paul Fejos, a Hungarian-born medical doctor, film director, and self-taught archaeologist/ethnographer, to manage its activities, and through Fejos's influence, the Fund in 1942 defined its focus as the field of anthropology. In 1951, its name was changed to honor the founder and reflect its mission. Fejos was the architect of the programs and approach of the foundation, and he led it (under the nominal oversight of a board of directors) until his death in 1963, when he was succeeded by his wife and associate, Lita Binns Fejos (later Osmundsen).

After a relatively inactive period during the war years, the second half of the 1940s saw the development of a wide array of activities. The core program provided small grants to individuals and organizations of any nationality. The guiding principle of

the program then and thereafter was to support whatever research expenses were deemed necessary but were not covered by other funders, offering grantees maximum flexibility and minimal bureaucratic requirements. In 1945, a town house in New York City was acquired, which soon functioned as a research institute, housing laboratories, technical equipment available for loan, a library, and space for visiting scholars. The house was also the setting for biweekly "Supper Conferences," important scholarly gatherings that continued for 35 years. In addition, occasional large international symposia were sponsored and held off-site. New programs were devised, among them the Viking Fund Publications in Anthropology monograph series, Summer Seminars in Physical Anthropology, and the Viking Fund Medal.

In the 1950s, when large public and private agencies were providing more ample grants for anthropology, the foundation decided to concentrate a part of its modest endowment on fostering communication and collaboration among scholars worldwide. Two initiatives addressed that goal: (1) the acquisition in 1957 of Burg Wartenstein, a castle in Austria, to serve as an international conference center and (2) the founding in 1959 of the journal *Current Anthropology*. There followed a period of prosperity for both the anthropological profession and the foundation. All programs flourished, and new ones were developed, notable among them a casting program (Anthro-Cast), which pioneered the production of high-quality casts of fossil specimens for research and teaching.

In 1969, a new tax law in the United States imposing more stringent spending and monitoring requirements necessitated some changes in the foundation's operations. The early 1970s brought added financial difficulties: inflation, a poor investment climate, and erosion in the value of the dollar. As the endowment declined, the board was faced with the decision to spend the foundation out of existence or to continue it at a much reduced level. They took the latter course, terminating several programs and, in 1979, selling both Burg Wartenstein and the New York house. The sale of the properties and the moving of the offices to modest rental space meant a severe reduction in in-house projects and a greater emphasis on grant making; in effect, Wenner-Gren no longer functioned as a research institute. Eventually, the board sought new management more suited to the current situation. Lita Osmundsen retired, and after a search, Sydel Silverman was appointed as president in 1987.

A time of reinvigorating programs and instituting new ones, regularizing management, and repairing relationships with the anthropological community followed. This progress was aided by an increase in the endowment, which grew to more than $100 million by 2000, when Silverman retired. Richard G. Fox was named president, and in 2005, he was succeeded by Leslie Aiello. In 2011, the endowment stood at more than $150 million, providing an annual program budget of approximately $6 million.

Current Programs

The principle of maintaining a range of programs that complement one another guided the foundation at its inception and continues to do so today. The largest funding initiative supports individual research of doctoral students and established scholars. In addition, grants are made for write-up of completed research, for the enhancement of research resources and scholarly exchange, for the preservation of anthropology's historical record, and for the organization of conferences and workshops. The foundation's special interest in the international advancement of anthropology is furthered through fellowships for the doctoral training of students from less developed countries, multiyear grants to support anthropology departments in countries where the discipline is underrepresented, and grants for international collaborative research projects. The International Symposium Program, which organizes intensive working conferences on the model developed at Burg Wartenstein, is ongoing; about 145 have been held to date (2012). *Current Anthropology* continues as a highly regarded journal, covering all branches of anthropology worldwide. The foundation remains attentive to the needs of the discipline and ready to devise new initiatives wherever it can make a meaningful impact.

Significance for Anthropology

Although the foundation has always had comparatively modest resources, its diverse programs, including the more than 7,000 grants awarded over its history, have had an inestimable impact on research in anthropology. There are many cases where the

direction of a field was changed, for example, the key role played by the foundation in the application of carbon-14 dating to archaeology, its influence on the transformation of an "old" (typological) physical anthropology into one based on a new synthesis of genetics and evolutionary theory, and the numerous international symposia that charted innovative approaches to a field of inquiry or opened up new ones, such as the politics of reproduction and transnational migration. The foundation's achievements derive from its long-standing close relationship to anthropology, which has enabled it to assess and respond strategically to current needs and promising research directions and thereby provide leadership at the forefronts of the discipline.

Westermarck, Edward

Edvard (Edward) Alexander Westermarck (1862–1939), the Finnish social anthropologist and philosopher, is known for his studies on the evolution of human marriage and morality, as well as for his fieldwork in Morocco. At the London School of Economics, he was a teacher of the first generation of professional anthropologists in Britain.

Biography and Major Works

Westermarck was born in Helsingfors (Helsinki), what was then the Russian Grand Duchy of Finland, to upper-middle-class parents with university connections. An elder brother of his died of tuberculosis, and Edward, too, had early health problems. Due to asthma, he was frequently cut off from school and social life, although he passed his matriculation exam on schedule in 1881. It was only in 1886, during a spell of strenuous mountaineering in Norway, that he gained confidence in his physical fitness. Westermarck never married. He was not outgoing, but he was friendly and got along with people, regardless of culture and class background. He had some lifelong good friends.

In 1881, Westermarck enrolled at the Imperial Alexander University at Helsingfors (today the University of Helsinki). He graduated with a thesis in philosophy in 1886. The naturalistic tendencies of European thought in the 1880s made a lasting impact on him. He was skeptical of German idealism, and he dismissed Christianity as untenable both philosophically and ethically. At 24, inspired by Darwin's views on the early development of humans, he learned English to study the reports by colonial administrators and missionaries that were kept at the British Museum Library.

Westermarck spent the academic year of 1887–1888 in London, writing his doctoral thesis. His friendship with the psychologist James Sully (1842–1923) proved crucial at this time. They had met in Norway 2 years earlier, and it was Sully who introduced Westermarck into his academic network. Sully also presented Westermarck to the Couplands, with whom Westermarck lodged and who also had connections with leading British intellectuals.

Westermarck defended his thesis at Helsingfors in 1889, and E. B. Tylor recommended the work to Macmillan Publishers. Macmillan published an extended version, with a preface by Alfred Russel Wallace, in 1891, *The History of Human Marriage*. The book and the huge publicity it received were, according to Westermarck, the turning point of his career.

After this tour de force, Westermarck embarked on a work of even more encyclopedic dimensions: a general, comparative account of the development of morality. *The Origin and Development of Moral Ideas* was published in two volumes in 1906 and 1908.

The year 1898 saw the beginning of Westermarck's lasting connection to Morocco. At first, he intended his trip to be just one leg of a comprehensive research journey. However, he soon realized that Morocco alone presented enough material for his research. Even in general, the interests of social anthropologists at the time were shifting toward the intensive study of geographically limited areas. Westermarck's active field research covered 6 years, on and off from 1898 to 1913. He traveled widely, even in regions considered out of bounds not only for Europeans but also for Moroccan government officials. After 1923, he again regularly spent some part of the year in Tangier, where he bought a house. Shereef Sîdi Abdessalam el-Baqqâli (1876–1942) was Westermarck's crucial contact and friend in Morocco. El-Baqqâli was employed as Westermarck's guide and the head of his staff,

but he also gave Westermarck language instruction and collected fieldwork data. El-Baqqâli is explicitly acknowledged as the coauthor in *Wit and Wisdom in Morocco* (1930), a collection of proverbs. In 1926, Westermarck published the main results of his Moroccan research in his two-volume *Ritual and Belief in Morocco*.

In 1904, Westermarck was enrolled as Appointed Teacher of Sociology (in effect, social anthropology) at the London School of Economics. In 1907, the 3-year appointment was converted to a professorship, which Westermarck held until his retirement in 1930.

At Helsingfors, Westermarck sought the chair of philosophy. The university senate voted in his favor, but the appointment was blocked for reasons connected with language policy. The university was bilingual, with Finnish and Swedish as the media of instruction. Westermarck's first language was Swedish, but he refused to sit the required exam for Finnish. The chair was given to a Finnish speaker, but in compensation, a new professorship was created for Westermarck in 1906. It was agreed that Westermarck could also keep his job in Britain and spend part of the year there.

At the turn of the 20th century, Finnish bourgeois politics was dominated by two central concerns: (1) relations to the Russian central government and (2) the rivalry between ethnic Finns and ethnic Swedes. Nationalist politicians in Russia hoped to dismantle the constitutionally guaranteed Finnish autonomy. Westermarck made use of his international contacts to gain sympathy for the Finnish cause. In Finnish domestic politics, Westermarck stressed Swedish language rights. After Finnish independence, he was part of the Finnish delegation to the League of Nations, sent to represent Finland in a dispute with Sweden over the Aaland Islands. He advocated Swedish cultural autonomy within a territorially unified Finnish state.

Westermarck's work for the Academy of Åbo (today, Åbo Akademi University) must be seen in this context. In 1918, the academy was founded as a private university, with Swedish as its language of instruction. Westermarck was appointed to the chair of philosophy, which he held until 1932. He was also elected the first rector for 1918 to 1921. As head of the new university, he was active in recruiting staff and securing donations. He hoped to foster a modern research university with a strong profile for the social sciences. No doubt he had the London School of Economics in mind as a possible model. However, the senate failed to renew Westermarck's rectorate for another 3-year period. Westermarck's friends saw this as a power grab by the vice rector and his retinue in the science faculty.

The outcome was probably a blessing in disguise, as it left Westermarck with more time for research. His years at Åbo saw the completion of many long-term projects. There were three volumes on Morocco and some new work on sex and marriage. In 1932, he finished *Ethical Relativity*. His very readable memoirs, *Memories of My Life*, were published in 1929. Westermarck's very last book, *Christianity and Morals*, sums up his various moral objections to Christianity.

On September 1, 1939, Nazi troops crossed the Polish border, plunging Europe into war. Westermarck, on hearing the news on the radio, reacted with a severe attack of asthma and died on September 3.

Critical Contributions to Anthropology

At the turn of the 20th century, the boundaries between anthropology and moral philosophy were sometimes vague. Westermarck's research spans both. He addressed three major themes: marriage and sexuality, the nature of morality, and popular religion in Morocco.

Marriage and Sexuality

In *The History of Human Marriage*, Westermarck's main finding was that monogamy was the original form of human conjugal life. The theory of original promiscuity, which had been the received view, was refuted with a wealth of evolutionary argument and historical data. Westermarck explained monogamy and prohibition of incest in terms of instincts, which in turn had biological explanations.

Westermarck's explanation of incest aversion between siblings is known as the *Westermarck hypothesis*. It is sometimes seen as his most important contribution to modern research. He claimed that the physical proximity of two individuals during childhood activates in them an inborn disposition to avoid sexual contact. What activates aversion is cohabitation, not genetic relatedness per se. This still makes evolutionary sense. It reduces inbreeding, because individuals who grow up together are for the most part also genetically related.

Sigmund Freud rejected Westermarck's theory. Famously, he believed that the earliest human sexual impulses are directed toward the child's immediate family members. There would be no reason for the incest taboo unless humans were actually tempted to commit incest, something that Westermarck's theory would deny. Westermarck responded in a revised edition of his book in 1921. He pointed out that activities that humans instinctively avoid may *also* be prohibited by law and custom. But Westermarck did not describe exactly how incest aversion, as a psychological propensity of individuals, gives rise to social norms and institutions relating to incest. The final assessment of Westermarck's hypothesis perhaps depends on whether it is taken to explain only incest aversion or also the social prohibition against incest.

Theory of Morality

Westermarck presents his theory of morality in *The Origin and Development of Moral Ideas.* The bulk of this study consists of historical and anthropological data. But it also develops a philosophical position. Morality is based on emotions of a particular kind, called retributive emotions. Higher animals, including humans, have a natural propensity to react to each others' behavior by paying back in kind, for good or ill. Moral emotions appear when retributive emotions acquire a universal, impartial, and disinterested character. During cultural evolution, moral judgments increasingly target the agents' motives instead of external behavior. Their range of application extends beyond the individual's immediate surroundings, while increasingly excluding animals, children, and the mentally ill as subjects of moral evaluation.

Ethical Relativity reiterates Westermarck's theory, with a focus on philosophical argument. He argues that a normative science of ethics is impossible. Ethical systems that claim rational grounds, such as utilitarianism and Kantianism, in fact reach their conclusions on the basis of emotions. In the last analysis, moral judgments are generalizing claims about emotions that the relevant actions would normally evoke in impartial observers. But Westermarck sometimes just makes the more modest claim that moral concepts are "ultimately based" on emotions.

Westermarck believes that moral emotions give rise to mores and customs, which are later codified into laws. However, he is not very specific about the process or about the role of society in it. Westermarck is sometimes accused of reducing social phenomena to psychology. This is not quite true, but his main emphasis nevertheless lies on shared human nature, not on the social dynamics that influence moral outlook.

In his broad anthropological syntheses, Westermarck shows himself an adherent of evolutionism and comparative method. He hoped to uncover the instincts or emotions that lay at the bottom of various customs and beliefs. Thus, by their "origins," he did not simply mean their beginning in the prehistoric past but, more important, the emotional background that supports them at the present moment.

Fieldwork in Morocco

In Morocco, Westermarck studied popular religious ideas such as holiness (*baraka*). Holiness could be inherited, acquired, and lost. Westermarck found its sensitivity to external influences to be its socially most important characteristic. He considered his result to be at odds with Émile Durkheim's theory of primitive religion.

Westermarck's ethnographic material from Morocco is a valuable and accurate historical source. It sheds light on popular beliefs that were unknown to other Westerners and ignored or suppressed in the existing scholarship by Moroccan authors on Islamic law and religion. In his presentation and analysis, Westermarck followed the conventions of comparativist anthropology. He did not attempt to relate native ideas and practices to the general dynamic of society. Nevertheless, he divulged valuable data that make such analysis possible.

Westermarck's Legacy

Westermarck's importance was widely recognized in the early 1900s. However, his fame declined rapidly as the comparative method lost ground. Westermarck, who was criticized by Durkheim, developed an antipathy toward French sociology and functionalism. Westermarck freely acknowledged his intellectual debt to James G. Frazer, Edward Burnett Tylor, and other comparativists of the previous generation. What is less often remembered is that he both trained and helped materially to support the next generation of scholars, many of whom

eventually embraced functionalism. Westermarck was among the first to stress the importance of extended fieldwork and of becoming fully conversant in the native languages. By this, he set the standard for subsequent anthropology.

Westermarck's appointment at the London School of Economics was a crucial step in the professionalization of anthropology in Britain. At the London School of Economics, Westermarck became the teacher of an entire generation of British and international researchers, including E. E. Evans-Pritchard, Raymond Firth, Morris Ginsberg, Ian Hogbin, Lucy Mair, Bronisław Malinowski, Ashley Montague, Talcott Parsons, Hortense Powdermaker, Isaac Schapera, and Gerald Cambden Wheeler. In the 1920s, Westermarck and Malinowski conducted their seminars together.

Westermarck's Finnish students included the anthropologists Hilma Granqvist, Rafael Karsten, Gunnar Landtman, and Ragnar Numelin; the ethnologists Uno Harva and K. Rob. V. Wikman; and the philosopher Rolf Lagerborg. Due to Westermarck's influence, social anthropology was taught relatively early at Finnish universities. The Westermarck Society, founded in 1940, became the professional association of Finnish sociologists.

The last few years have seen a rise of interest in evolutionary approaches to human behavior, including Westermarck's incest theory. Empirical research appears to support his explanation of incest aversion. In moral philosophy, *Ethical Relativity* is known as a carefully developed statement of a relativist and emotivist position.

White, Leslie

Leslie A. White (1900–1975) is among the world's most cited anthropologists. White was a controversial figure who was schooled in Boasian anthropology but went on to forcefully inject social evolutionary theory into the discipline during the 1940s through the 1960s.

Early Years and Education

White was born in Salida, Colorado, on January 19, 1900. He was the second of three children. White and his siblings (Helen, born 1898, and Willard, born 1902) were the children of Alvin Lincoln White, a civil engineer, and Mildred Mae Millard. White's father was a brilliant man who had little time for anything other than work. White's mother, 12 years younger than her spouse, fell in love with another man, and his parents divorced in 1905. White's father got custody of the children and briefly lived in Kansas City, Missouri, and Greeley, Kansas. White's father gave up his engineering career to purchase a farm in Lane, Kansas, where he and his children lived between 1907 and 1914. White's childhood memories were dominated by farm life. It was a lonely and unhappy existence for White and his siblings. White's limited social life revolved around a one-room schoolhouse dominated by a wood-burning stove and weekly trips to Lane. White hated the drudgery of farm life, but his life abruptly changed in 1915 when his unmarried sister became pregnant. White's father was devastated by

his daughter's pregnancy, and the family moved to avoid the social stigma attached to her condition. The constant moving and White's father's obvious shame over his daughter's pregnancy caused a major rupture in the family. The Whites eventually moved to Zachary, Louisiana, where White graduated from high school.

White was an outstanding student, and all his teachers noted that he had marked ability. Despite his academic success, his relationship with his father remained troubled, and on the day he graduated, he left home on foot with a single small suitcase. White worked as a bookkeeper until he enlisted in the navy in 1918. Although he never explained why he joined the navy, the experience was life changing. All who have written about White's academic career have stressed this point. In the navy, the stark contrast between the idealistic new recruits and the war-weary, seasoned veterans led White to believe that all he had been taught about the "American way of life" was nothing more than propaganda and folklore. After White was discharged from service in August 1919, he entered Louisiana State University. He abandoned his idea of studying physics or astronomy and instead majored in history. Two professors at Louisiana recognized White's abilities and strongly suggested he transfer to Columbia University.

White studied psychology at Columbia and received a BA in 1923 and an MA in 1925. Although he took no anthropology courses as an undergraduate or graduate student, he did take classes at the New School for Social Research, where he was exposed to anthropology for the first time. White began reading the work of Franz Boas, Alexander Goldenweiser, Alfred L. Kroeber, Elsie Clews Parsons, and Clark Wissler. At the urging of his close friend Harry Elmer Barnes, White decided to attend the University of Chicago, convinced that Chicago had the best program in anthropology and sociology in the nation. He was drawn to the interdisciplinary nature of the program and its outstanding reputation, but his tenure at Chicago was turbulent and controversial. Sociologists such as Ellsworth Faris did not like White, and at one point, he was encouraged to leave the department. There is no question that White was a polarizing figure, a lightning rod who made already existing tensions in the department much worse. According to White, in May 1927, matters came to a head when he took a written and oral examination. White had published an article critical of the work of some of the sociologists, and quarrels among different departmental factions erupted during his examination. White believed that this examination led the joint department to split apart, and his views on the separation of the department have become part of the folklore of Chicago anthropology.

Professional Career

Entering the field of anthropology held great appeal for White, who wanted to prove to anyone who doubted it that the social sciences were relevant. He believed that they were tools that could enhance equality and promote positive cultural evolution. White's first anthropological field trip was to Acoma in May 1926. His dissertation, "Medicine Societies of the Southwest," was very much within the Boasian framework. For young scholars such as White, few sources of financial aid were available. Thus, White was fortunate to work with Elsie Clews Parsons, who became not only a mentor but also a significant source of financial support. Parsons's academic and financial support had a deep impact on White, as evidenced by their voluminous correspondence. Without Parsons's support, White, perpetually short of money, could not have produced the monographs he wrote. Parsons and White used a "secretive method" in which they perceived the ethnographer's task to be to seek out knowledgeable informants who would be willing to divulge forbidden or hidden information. Parsons and White were gifted at finding informants and went to great lengths to keep their identities secret. By today's standards, White's fieldwork methods were unethical or, at best, questionable. No current ethnographer would consider using the clandestine research methods White employed. But at the time White was doing fieldwork, his methods were common. According to Don Fowler, a historian of Southwestern ethnology and archaeology, scholars of White's era assumed the role of "ethnologist as high grade detective."

Between 1928 and 1957, White's ethnographic fieldwork received uniformly high praise from Southwestern experts. White wrote five monographs: *The Acoma Indians* (1932), *The Pueblo of San Felipe* (1932), *The Pueblo of Santo Domingo* (1935), *The Pueblo of Santa Ana*, and the *Pueblo of Sia* (1962). All were published as Memoirs of the

American Anthropological Association or by the Bureau of American Ethnology. None of White's monographs gave a hint that he would become a champion of evolutionary theory and that he would become deeply antagonistic to Boas and his students. For White, the attraction of fieldwork was twofold. First, he wanted to arouse in his readers a deep appreciation of, and interest in, American Indian culture and to illustrate why the Indians believed and acted as they did. White's work thus went beyond the mere collection of facts, for he showed that American Indian culture was rich in symbolic content and that it deserved careful analysis in its own right. In so doing, he wanted to prove that Indian culture in the broadest sense of the term was not inferior, as racists maintained. Second, White wanted to demonstrate the power of cultural systems in a particular setting—that is, to prove that Indians and their manner of living was every bit as important and "normal" as white, middle-class American culture. In White's estimation, all cultures trap their members in complex webs and exact a heavy toll on those who live within them. Accordingly, White wanted to understand culture's inner workings, so that rather than being constrained by culture one could be liberated.

The dichotomy between White's fieldwork with Native Americans in the Southwest and his forceful advocacy of cultural evolutionary theory has struck many anthropologists as startling. This ignored a basic fact: Without an appreciation of White's political commitments, it is not possible to appreciate the reasons why he embraced evolutionary theory and forcefully argued that it had a place in the discipline. It was White's political commitment to the Socialist Labor Party (SLP) that shaped the corpus of evolutionary work for which he is so well-known. Accordingly, the development of White's thought during the Depression era is most clearly seen in his largely unknown contributions under the pseudonym John Steel to the *Weekly People*, the official organ of the SLP. Within the pages of this socialist paper, White honed the arguments on cultural evolution that appeared in various anthropological journals in the 1940s. During the 1930s, White developed the concept of cultural evolution because he believed that it could function as both a science and a principle of action consistent with his Marxist views. Anthropology's significance and importance for him, therefore, was that it provided a self-conscious, rational, and humane way of understanding the transition from one type of society to another.

The period 1927–1930 had a tremendous impact on White's life and career. In 1927, he accepted his first teaching position at the University of Buffalo, where he had access to the papers of Lewis Henry Morgan. In 1929, he was among the first American scholars to visit the Soviet Union, participating in a 6-week trip sponsored by a Communist Party front organization called The Open Road, and in 1930, he accepted a faculty position at the University of Michigan. The first material published by White that indicated the importance of evolutionary theory appeared shortly after he returned from his trip to Russia in 1929. In 1930, White delivered a paper at the combined meeting of the American Association for the Advancement of Science, the American Folk-Lore Society, and the American Association of Physical Anthropologists. The paper, "An Anthropological Appraisal of the Russian Revolution," was very different from other presentations, and the language used was provocative. In his presentation, White argued that the Russian Revolution was the most significant event in modern history. Taking exception to the various ways in which it had been discussed by political pragmatists, White argued that it was not a revolution at all but a cultural mutation resulting from centuries of cultural development. Thus, for White, the Russian Revolution was not a model "social experiment"—that is, a planned human intervention in the social process designed to raise the welfare of people—or the realization of an idea created in the mind of some radical thinker. For White, the Russian Revolution and the political unrest that was shaking the world was evidence that the world's social and political problems needed to be reconsidered. In White's estimation, the Russian Revolution proved that society was evolving culturally. Its significance was that it ushered in a new social order that was an evolutionary development beyond capitalism. It dissolved vertical class stratification and the exploitation of the worker, characteristics of the capitalist system.

White's paper made headlines nationwide. Archival records indicate that he was seriously considering abandoning anthropology for a career in socialist politics. Why he did not change careers is unknown. What is known is that his fledgling career in anthropology at the University of Michigan

almost came to an abrupt halt. As a recent hire, he had little job security, and the university administrators were furious. Radicalism had no place on the campus, and one administrator told White that he believed that his tenure at Michigan would be short. White had joined the SLP in Buffalo in 1929, but now, shaken, he became increasingly secretive. He ceased writing anything remotely provocative under his own name. He also employed a number of other precautions. He used post office boxes in Detroit and Cleveland for socialist mailings and never spoke to a socialist audience near Ann Arbor. What White could not hide was that his conception of the evolutionary development of modern society was organized along radical materialist lines. In essence, White was attempting to describe the SLP's theory of evolution in anthropological terms. White had no doubt that an anthropologist without a materialistic conception of history was akin to a mariner without a compass. He had reached this conclusion from the commonsense assumption that the basic element of any culture is the business of living or the problem of survival.

By the end of the 1930s, White wanted to branch out from evolutionary writings for the SLP. White was well aware that anthropologists would be skeptical, if not hostile, to his views, but he felt that he had a moral and scientific obligation to change their minds. He committed himself to waging battle with the entire discipline if necessary, for he was convinced he knew the truth. His work was not simply an intellectual exchange of ideas but a call to arms. White first presented his ideas in 1939 at a meeting of the American Anthropological Association. He was strongly encouraged to discuss evolutionism by Ralph Linton, who had organized a session titled "Theory and Method in Ethnology." Apart from White, other presenters included Bronisław Malinowski, Adam Kardiner, George Murdock, and George Herzog. Looking back, White recalled that he had blasted the antievolutionists with considerable vigor. According to Esther Goldfrank, White spoke with fervor, and the audience was visibly upset, with the lone exception of Franz Boas, who was unmoved by White's words. It was on this day that White became an iconoclast within the field of anthropology. However, it was not until several years later, in 1943, that the article most often identified as heralding the revival of evolutionary theory ("Energy and the Evolution of Culture") was published in *American Anthropologist*. This was White's first article solely concerned with evolutionism and intended for professional anthropologists. It was here that he proposed the thermodynamic law $E \times T = C$ (energy times technology equals culture). This article was quickly followed by a steady stream of others published in *American Anthropologist*, *Southwestern Journal of Anthropology*, and several other academic journals.

The pointed exchanges White had with Alfred L. Kroeber, Robert Lowie, Julian Steward, and many others took place in print and via heated correspondence. By the end of the 1940s, harsh words had become the norm. The polemical debates that were waged were widely discussed, and there is no question that White almost single-handedly reinjected evolutionary theory into anthropological discourse. Despite the harsh words exchanged, White and those he most vigorously attacked, such as Lowie and Steward, had a grudging respect for each other. In the succeeding years, White would elaborate on many of his ideas as they concerned the theory of cultural evolution, the science of culture, the career of Lewis Henry Morgan, and ethnological theory—especially Boas's contribution. With the publication of *The Science of Culture* and *The Evolution of Culture* in 1959, White had won the battle to revive evolutionary theory. Unfortunately for White, he needlessly alienated scholars sympathetic to his work. In some ways, after 1959 he became his own worst enemy. The Plains anthropologist Bernard Mishkin had earlier characterized White as being pugnacious and believed that he wielded his pen as if it were a tomahawk.

Post-1960 and White's Legacy

White's contribution as an important anthropological theorist ended around 1960, for two reasons. First, his wife, Mary, died in June 1959. Her death started a downward spiral in White's professional and personal life. Many who knew White were convinced that he was never the same after Mary's death. For more than 30 years, Mary had organized White's professional life. She had typed all his papers, prepared his manuscripts for publication, and accompanied him on field trips to the Southwest. Second, after Mary died, White became an alcoholic. This led to a disastrous second marriage and numerous embarrassing incidents. Finally,

in 1966, White, driving while intoxicated, crashed his car into a tree. He was arrested and taken to a county jail, where he was photographed and fingerprinted. Two days later, he went to his first Alcoholics Anonymous meeting, and for the rest of his life, he attended at least two meetings a week.

After 1960, White published significantly less than he had in the past. The two books he published, *The Ethnography and Ethnology of Franz Boas* (1963) and *The Social Organization of Ethnological Theory* (1966) were roundly criticized by his peers. These works were not just unwarranted polemical attacks but ill-tempered diatribes against Boas and his followers. Even as White's own career declined, he profoundly influenced the careers of his students at the University of Michigan. Many scholars within the discipline readily acknowledge White's influence on their thought. For instance, Robert Carneiro, Lewis R. Binford, and Betty Meggers have all explicitly stated that White had a profound impact on their careers. Other students had a far more complex relationship with White. For example, Elman Service did not like to discuss the influence White had on his thought as he did not want to be too closely aligned with his mentor. Likewise, Marshall Sahlins moved very far from his early interest in evolutionism and does not consistently mention White.

More generally, White was instrumental in creating one of the best departments of anthropology in the United States in the post–World War II era. Hired in 1930 to replace Julian Steward, White transformed the anthropology department at the University of Michigan into the powerhouse it is today. For 25 years, White chaired the department in his own unique style. As chair, White is remembered both fondly and negatively. On the one hand, he was criticized for extreme frugality, and the pay structure in the department was chaotic. On the other hand, he always put the greater good of the department ahead of his own interests and concerns. For instance, he hired scholars whom he believed were a good fit for the department even if he did not like them. He firmly believed that it was in the best interests of the department and the university to discourage the development of schools of thought. To this end, he did his level best to prevent an ingrown "Michigan school" of anthropology. White believed that such schools of thought fostered a hermetic quality that inhibited intellectual growth and new ideas.

White retired in 1970, but after all his years of service, there was no fond farewell ceremony, party, or recognition of any sort. White had ambivalent feelings about the department and made very different statements to his friends and colleagues about his retirement. The reality is that the final years of his life were sad and lonely. His former students actively tried to help White. He taught part time at Rice University, San Francisco State University, and the University of California at Santa Barbara. At the time of his death, White was working on his magnum opus, *Modern Capitalist Culture*. He compared this manuscript to the La Brea tar pits—he quipped that like the dinosaurs, once he put his foot in he was never able to reemerge. Thus, the majority of White's work written later in his career is unpublished and voluminous. Thanks to Robert Carneiro, Ben Urish, and Burton Brown, *Modern Capitalist Culture* was published in 2008. Another full-length manuscript, "The Fuel Revolution," remains unpublished. For White, like many other influential anthropologists, the discipline was not merely a social science but a way of life.

Whorf, Benjamin Lee

Benjamin Lee Whorf (1897–1941) was an American linguist best known for the development and exemplification of a principle of linguistic relativity.

Life

Whorf came from a New England family with both artistic and scientific interests. He trained in chemical engineering, graduating from Massachusetts Institute of Technology in 1918, and soon after was hired as a fire prevention engineer at Hartford Fire Insurance, a position he held for the rest of his life, with time off for research. Whorf had theosophical connections, and he remained interested in spiritual questions and the relation of science to religion. But from an early age, his central fascination was in languages and their basic elements. In the 1920s, he started working on Aztec (Nahuatl) and Mayan languages, presenting scholarly papers and coming into contact with major figures in the field. In 1930, he obtained funding for research in Mexico, including fieldwork on Nahuatl as spoken in a village outside Mexico City. Whorf's work on Mexican material led, among other things, to a prescient proposal for the interpretation of the Mayan script as involving an important phonetic element. This view, dismissed for decades, turns out to have been essentially correct.

Whorf's thinking was transformed through contact with Edward Sapir, who moved to Yale in 1931. Whorf attended Sapir's classes and joined the PhD program under his supervision. Sapir urged Whorf to undertake the long-term study of a language very different from those of the Indo-European and Semitic families. Already familiar with Nahuatl, Whorf began years of work with Ernest Naquayouma, a New York–based native speaker of Hopi, another Uto-Aztecan language. Over the next 10 years, Whorf was an active participant in what has come to be called the first Yale school of linguistics. He was recognized by Sapir as "one of the most valuable American Indian linguists that we have at the present time" and taught one of Sapir's courses in 1938. In the summer of that year, Whorf visited the Hopi reservation in Arizona. Whorf died in 1941, at the age of 44.

Theory

From the time of his "conversion" via Sapir, Whorf was an exponent of Boasian linguistics, which denies assumptions of the superiority of some languages over others and of the universality of Western grammatical categories. Boasians showed that "primitivity" lay in the ear of the listener, since any language can seem chaotic and bizarre, and either excessively vague or excessively narrow in focus—both are used as criteria of "primitivity"—if judged by the standards of another. For this reason, holders of the Boasian view argued that it was inappropriate to start from the categories of traditional Western grammar, assume that they were universal, and then seek to find how they were expressed in non-Western languages. Instead, one should interrogate the forms themselves as they are used, something that will often require new terminology that more adequately reflects the actual patterns of the language. Basic elements of this linguistic program, as Boas himself recognized, had been laid out by Wilhelm von Humboldt (1769–1835) early in the 19th century. Much of Whorf's work was a drawing out of its implications.

Whorf himself, with his background in the natural sciences, seems to have assumed three operational "levels" in his thinking about science and linguistics.

Level 1: This level is that of the actual physical structure of the universe. Through most of modern Western history, this appeared to be adequately represented by Euclidean geometry and Newtonian physics. But developments in 20th-century science—Whorf cites relativity theory, quantum mechanics, and non-Euclidean geometry—reveal a very different universe, one that does not correspond directly either to our lived experience of the world or to our conceptualization of it. In this, Whorf was a scientific

discontinuist very much like his older contemporary Gaston Bachelard (1884–1961), and like him was interested both in critiquing and in understanding "common sense."

Level 2: Whorf accepted that there were universals of human experience, potentially offering "a canon of reference for all observers," beyond the diversity of languages and cultures. He saw Gestalt psychology as a science likely to uncover such a general frame.

Level 3: While lived experience may be universal, conceptualizations of this experience depend to a large degree on language and culture, and so vary. Although Whorf never claimed that all thinking is linguistic, he did maintain that we think to some degree in language and that insofar as this is the case, the traits of given languages can orient the subject to attend to differing aspects of experience. This point had been made by Boas and formulated by Sapir, citing Einstein, as "a kind of relativity"; Whorf wrote of "a new principle of relativity, which holds that all observers are not led by the same physical evidence to the same picture of the universe, unless their linguistic backgrounds are similar, or can in some way be calibrated" (Whorf, 2012, p. 214). The references to Einstein make it clear that this is a heuristic principle: Just as the observer must take his or her position and velocity into account when measuring someone else's, so the observer must take the patterning of his or her own language into account when considering another one. Just as there is no unmoving point in the Einsteinian universe, so for the Boasians, there is no language or group of languages that provides the measure for all others. Measurement, or calibration, is possible, but it can only be mutual, taking the specifics of both participants into account.

Boas and Sapir had insisted that one's language posed no limit to the potentialities of what one *could* conceive, yet both gave examples in which language did influence conceptualization. Whorf resolved this apparent contradiction by introducing a distinction between the (unlimited) possibilities of thought and the limits of what he called habitual thought—unforced everyday thinking that tends to follow the easiest associative pathways, those laid down by languages and cultures. The idea that habituation creates easy, but not inescapable, paths to follow is clear in the very analogies used by Whorf (and earlier by Sapir) to characterize the influence of linguistic patterns: tracks, paths, roads, grooves—it is always possible, with effort, to get off the beaten track and lay down a new one. This is an important point in reading some of Whorf's apparently deterministic statements, which are always referring to habitual thinking; and it is why there is no contradiction in Whorf himself feeling that it should be possible, for instance, to use English to give a presentation of concepts implicit in Hopi grammar.

The relativity principle operates for all levels of language. Phonetics and phonemics provide a model ("Phonemics is a relativity principle" [cited in Lee, 1996, p. 88])—it was Whorf who introduced the term *allophone* to indicate a positional variant of a phoneme. Vocabulary is pertinent insofar as words are related or unrelated, thus showing a conceptual linkage between referents. But the aspect of language on which Whorf concentrated most of his attention was that of pervasive grammatical categories. These categories, such as gender, tense, number, or, in some non-Western languages, shape or data source, are constantly used in constructing sentences and are not easily accessible to conscious reflection. As a result, as Boas had indicated, they are likely to guide attention to some aspects of a situation rather than others, and to do so unconsciously or semiconsciously. These categories could be explicitly marked (overt) or not (covert); Whorf was a pioneer in the identification of covert categories or *cryptotypes*.

Hopi and Standard Average European

Whorf offered an extended reflection on the conceptual implications of grammar in a series of articles on Hopi. His approach is always through contrast, as exposure to a very different system makes our own assumptions explicit. Whorf introduces the idea that in important ways modern western European languages share underlying grammatical semantics: Instead, then, of talking only about English, Whorf contrasts Hopi with what he calls Standard Average European (SAE), a category that has come to be recognized as a distinctive linguistic area, or *Sprachbund*.

- In SAE, plurality applies both to real plurals, items that can appear together, and "imaginary plurals," items that can never appear together to form a group. So English treats "ten men" and

"ten days" in the same way. Hopi, on the other hand, only has real plurals. This has a first implication for concepts of time: The universal human experience of duration (Level 2 above) is conceptualized differently in the two cases. In SAE, units of time are treated as things that can be counted using cardinal numbers; in Hopi, time relations are treated with ordinals: "on the tenth day" rather than "ten days."

- SAE languages have both count and mass nouns ("three bottles" vs. "some water" or "a glass of water"). This distinction, Whorf argues, leads to conceiving imaginary masses of substance, notionally infinite extents of water, or bread, or bone, out of which "a glass of water," "a loaf of bread," or "a bone," respectively, are notionally cut. This extends to time, which is treated as a limitless uniform substance of which years, days, and minutes are chunks of differing size. Hopi, on the contrary, only has count nouns. "In specific statements, 'water' means one certain mass or quantity of water, not what we call 'the substance water.'" And time, which in human experience never takes the form of a thing with a shape, is not treated with nouns at all in Hopi but with "a kind of adverb, to use the nearest SAE analogy."
- One class of Hopi verbs can appear either using the unmarked stem, which gives the meaning of a single occurrence, or in a form indicating repeating action. Unlike SAE verbs, however, this distinction operates equally over what we call time and what we call space: Just as the punctual verb "It gives one slosh" has a segmentative form "It is tossing in waves," the punctual "It forms a sharp acute angle" has the segmentative "It is zigzag."
- A Hopi verb can either be unmarked or carry one of two suffixes that indicate distinctions that most of the literature (including Whorf's earlier formulations) labels as tenses but that Whorf—on second reading, as it were—came to conceive of as "validity forms," which he called "assertions": the unmarked reportive, formerly called past-present; the expectative, formerly called future; and a third form that indicates general truths. Whorf argues that the first two are not tenses in the SAE sense but distinctions between what is already known, including both the past and the objective aspect of the present, and what is coming into being, including both what we call the future and the transformative aspects of the present. SAE, by contrast, has a three-part division of past, present, and future, which, in accord with the treatment of mass substance discussed above, are conceptualized as virtual "spaces" to be filled with events. This corresponds to the modern Western conceptualization of "time" (Level 3), but it is only one of many possible constructions accounting for the general human experience of time as duration (Level 2)—the Hopi "assertions" offer another.
- Whorf thus claims that Hopi conceptualizes (Level 3) human spatiotemporal experience (Level 2) differently than does SAE. In particular, it does not separate empty uniform space from a domain of uniformly flowing one-dimensional time. This is why, in an often cited manuscript passage, Whorf (2012) writes that Hopi contains

> no words, grammatical forms, constructions or expressions that refer directly to what we call "time," . . . or that even refer to space in such a way as to exclude that element of extension or existence that we call "time," and so by implication leave a residue that could be referred to as "time." (pp. 73–74)

- This has often been taken to mean that the Hopi are either primitives incapable of conceiving time or mystics living outside time: On the contrary, what Whorf is saying is that our own constructions of space and time (Level 3) are "recepts from culture and language."

Whorf After Whorf

At the time of Whorf's death, he had published only a small number of articles. During the following 15 years, these were reprinted along with manuscripts discovered after his death, culminating in 1956 in the publication of the volume *Language, Thought, and Reality: Selected Essays of Benjamin Lee Whorf*, which is still the main source for Whorf's writings.

In the 1950s, researchers interested in testing for linguistic variation in cognition first mentioned a "Whorfian hypothesis" or "Sapir-Whorf hypothesis" that language influences thinking in a way that should be amenable to the kind of testing psychologists are comfortable with. Note the difference between such a "hypothesis" and Whorf's *principle*

of linguistic relativity requiring the specific characteristics of one's language to be taken into account. The psychologists carried out testing primarily on vocabulary, not on grammatical categories, and the favorite domain was that of color. It was argued that since Whorf believed that language, which could be reduced to vocabulary, determined thinking, and therefore perception, he must have held that the number of color words should determine color perception. Since, in fact, human physiology affects color perception, such experiments generally failed to show significant language-based differences.

With the rise of the cognitive sciences from the 1960s, with their project of discovering how thinking works regardless of linguistic and cultural differences, Whorf became a convenient straw man: Philosophers, psychologists, and linguists regularly took his name as a label for extreme linguistic determinism ("the famous Sapir-Whorf hypothesis of linguistic determinism," as Steven Pinker puts it), which they then proceeded to disprove or dismiss, over and over again. One particularly influential critique came in 1981 from the linguist Ekkehart Malotki, who argued that many Hopi forms can best be translated into English using tenses and the whole SAE "metaphysics" of time. The method here is the opposite of Whorf's (and of Boas's and Sapir's): It asserts universal (which happen to correspond to SAE) meanings for forms and then notes exceptions, leaving them as exceptions. In this, it confuses what I have called Level 2 and Level 3, taking SAE conceptualizations as equivalent to human experience in general.

Although some scholars had continued to draw on Whorf's ideas throughout the period (e.g., Dell Hymes, Paul Friedrich, Michael Silverstein, and George Lakoff), the 1990s saw a snowballing of interest. This was due both to more serious exegeses of what Whorf actually said in the work of John Lucy and Penny Lee and to more sophisticated psychological testing, often based on grammatical categories (e.g., number, animacy, space and time categories, gender), which began to find "Whorf effects." There is even talk of a "neo-Whorfian renaissance." So far, this rediscovery bears mainly on cognition. But the principle of linguistic relativity as Whorf formulated it is open-ended: We do not know the implications that using a given language may have not only for cognition but also for broader conceptualization and imagining, for everyday social interaction, or for the exploitation of linguistic potentialities in verbal art.

Wilson, Edward O.

Edward Osborne Wilson (1929–), a Harvard professor for more than 50 years and one of the world's most eminent entomologists, is best known for his

role as a prolific communicator about science to the general public. While some of his books express his deep love for nature and concern for life on earth, others are ambitious syntheses attempting the seemingly impossible: the biological understanding of morality and religion; the mathematical modeling of the relationship between genes, mind, and culture; or the unification of the natural and human sciences.

Early Work: *Island Biogeography, The Insect Societies,* and *Sociobiology*

In the early 1950s, after earning a BS and MS in biology from the University of Alabama, Wilson became a graduate student at Harvard. At Harvard, he discovered the "superorganism" concept promoted by the eminent Harvard entomologist W. M. Wheeler (the adviser of Wilson's own PhD adviser, C. M. Carpenter). Wilson was fascinated by Wheeler's discussion about the cooperation and division of labor in insect societies and, in his own research, identified the crucial role that pheromones played in insect communication. In 1958, Wilson's pathbreaking contributions earned him a position on the Harvard faculty.

Wilson liked to structure and synthesize scattered information, creating new "tractable" scientific subfields. An early example was his *Island Biogeography*, written together with Robert McArthur (1967). His next large overview was *The Insect Societies* (1971), a big coffee-table book, in which the last chapter contained the blueprint for his next big step: an overview of the vertebrates. That was *Sociobiology: The New Synthesis* (1975), the leading goal of which was to extend the modern synthesis of Mendelism and Darwinism in the 1930s and 1940s (which used the newly invented mathematical population genetics to "translate" evolutionary processes into changes of gene frequencies in a population) to encompass social behavior. As a new comparative discipline, sociobiology was intended to deal with all aspects of social behavior, including human. To fit with the prevailing neo-Darwinian paradigm, however, sociobiology needed to be formulated as a branch of modern population biology. Wilson believed that this would also help boost the position of evolutionary biology as a worthy competitor to the ascendant molecular biology at Harvard. More philosophically, Wilson also hoped that sociobiology would be capable of unifying the natural and human sciences.

The idea that social behavior could be treated as an evolutionary trait (similar to, say, morphology) was completely new to science at the time. W. D. (Bill) Hamilton, who in 1964 started the sociobiological revolution (while not using the term *sociobiology*), kept the discussion at a universal theoretical level. However, Wilson's explicit treatment of humans as a biological species in the last chapter of *Sociobiology* and his discussion of the probable genetic basis of many traits typically regarded as cultural or uniquely human (such as sex roles, or moral and religious beliefs) triggered the fierce sociobiology controversy in the fall of 1975. For the critics, including Wilson's own colleagues at Harvard, Richard Lewontin and Stephen Jay Gould, sociobiology was not new and exciting but an old and ideologically tainted "bad" science.

Wilson's Sociobiological Paradigm

While Wilson was accused of being a biological determinist, as a modern evolutionist he took pains to emphasize the *interaction* of genes and environment with regard to behavioral traits, contra Konrad Lorenz's view of aggression as an inflexible instinct. The adaptive nature of human traits also meant that there had been enough time for us to have changed our nature since the Stone Age. "Man makes himself genetically" was a phrase Wilson used. He admitted that evolution by natural selection in general was a slow process compared with culture and that the genetic differences between human populations were quite small, but he suggested that "multiplier effects" could affect these small differences and help speed up evolution. For Wilson, this pointed to the need for a new anthropological genetics. For the critics, committed "culturists," this was anathema.

There is no doubt that *Sociobiology* has had a great impact, not only as an encyclopedia of accumulated new theory and research but especially as a breaker of the post–World War II taboo on a biological explanation of human behavior. However, when it came to his own theoretical paradigm for sociobiology, Wilson did not work within the game-theoretical framework and core ideas exemplified by Bill Hamilton, George Williams, John Maynard Smith, Robert Trivers, and others (i.e., the way of thinking that would later be identified with "sociobiology" as a research paradigm). His own theory building rather aimed at capturing and quantifying

the full richness of the evolutionary process. This is why Dawkins's *The Selfish Gene* (1976), pedagogically focusing on "strategies" of "selfish genes" to explicate Neo-Darwinian reasoning, was such a different book from *Sociobiology*—a point largely ignored by political critics.

The Gene-Culture Connection

One aim of *Sociobiology* was to deliberately provoke the social sciences and humanities to consider biology, even suggesting that they would "shrink to specialized branches of biology." Later, however, Wilson totally reconsidered the relationship between genes and culture. In 1981, he produced a new version of sociobiology together with Charles Lumsden in their heavily mathematical *Genes, Mind, and Culture*.

According to Lumsden and Wilson, behavior is not explicit in the genes; rather, the genes prescribe a set of "epigenetic rules," but these are meanwhile influenced by the physical and cultural contexts, in fact "feeding" on them. The epigenetic rules are responsible for the architecture of the human mind. And this is how we get to culture. For the authors, culture equals the epigenetic rules translated into mass patterns of mental activity and behavior.

This is because the epigenetic rules affect individuals' choices of cultural behaviors or artifacts—"culturgens," isolated units that can be either chosen or discarded. (Obviously this meant a dismissal of any holistic conception in favor of a view of culture as simply an outcome of a mass of individual choices.)

But maybe the transformation of sociobiology was not so total. *Genes, Mind, and Culture* can rather be seen as the attempt to demonstrate mathematically what Wilson had earlier famously verbally declared in *On Human Nature*: "The genes hold culture on a leash." The book is full of models demonstrating how the mind (i.e., cognitive development) is directed by the genetically influenced epigenetic rules toward certain culturgens rather than others. This is how the genes hold culture on a leash. One of the prime examples of an epigenetic rule is avoiding mating with someone you grew up with (for more discussion, see below).

The idea of a coevolutionary process, with or without the mind, stimulated other researchers at the time (although the mathematical models from *Genes, Mind, and Culture* were not used). Social scientists used to regarding culture as a complex whole strongly disagreed with the depiction of culture as a "sum of mental constructs and behaviors, including the construction and employment of artifacts." Edmund Leach wrote a dismissive review in *Nature*. In *Promethean Fire* (1983), Lumsden and Wilson discussed the gene-culture connection in popular, verbal form.

Biophilia, The Diversity of Life, and the Science Wars

Biophilia, published in 1984, represented a transition between sociobiology and Wilson's next immediate project: the protection of the environment and the defense of the world's biodiversity. The book dealt with one particular postulated "epigenetic rule"—that of biophilia, our love for nature—while it emphasized the need to preserve nature.

Soon a new generation of university students got to learn about Wilson the environmentalist, rather than Wilson the sociobiologist. To demonstrate the acute danger of species extinction, Wilson used a model from his early book on island biogeography, which showed how the destruction of even a limited area had unforeseen repercussions for a much wider area. Later, Wilson's popular book *Diversity of Life* (1992) argued compellingly for saving the species-rich rainforest. In the meantime, he had published the magisterial and Pulitzer Prize–winning book *The Ants* (1990) together with his friend Bert Hölldobler, with whom he also later coauthored *Journey to the Ants* (1994).

In the meantime, in the wake of sociobiology, the new field of evolutionary psychology had emerged. With its emphasis on the evolved human mind and its active attempts to distance itself from sociobiology, evolutionary psychology may have appeared as a new paradigm. For Wilson, however, evolutionary psychology was just the same as his "revised" genes-mind-culture version of sociobiology, featuring the epigenetic rules.

Soon again, Wilson, highly visible at Harvard, was pulled into academic politics. In the mid-1990s, he joined the cadre of proscience activists in the so-called Science Wars, following Gross and Levitt (1994) in attacking the new "cultural left" in academia: postmodernists and social constructivists, who argued (and taught students) that science had

no special claim to truth. In his 1994 autobiography *Naturalist*, he even retroactively interpreted the attacks on sociobiology as early manifestations of postmodern "anti-science." (Ironically, as pointed out by Ullica Segerstrale, his 1970s critics were, rather, old-fashioned "defenders of the truth," believing in "good" and "bad" science.) Wilson's next book, *Consilience: The Unity of Knowledge* (1998), might be seen as, in part, his response to the Science Wars.

Later Themes: Consilience, Eusociality, and Religion

In *Consilience*, Wilson presented gene-culture coevolution as the shining solution to the quest for the unity of knowledge. The tools needed for connecting the social and the natural sciences and the arts were the epigenetic rules. They made it possible for us to perceive the world consiliently as a "seamless web of cause and effect." (Science, meanwhile, would continue accumulating epigenetic rules. Already existing candidates were now universal color terms, genetic control of behavior-affecting medical conditions, and biological constraints on aesthetic preferences).

In the 2000s, Wilson was ready for yet another update on his favorite creatures, the social insects (especially ants), written again with Bert Hölldobler. The focus in *The Superorganism* (2009) was on the explanation of the origin of insect eusociality. The authors wanted to play down the role of genetic relatedness and emphasize instead other factors (e.g., intercolony competition) as important for the emergence of cooperation, arguing for an explanation in terms of group or multilevel selection instead of kin selection. Meanwhile, the "fall" of kin selection and its substitution with group selection was, surprisingly, militantly announced by Wilson in articles from 2005 onward, creating a major controversy. He made this point also in his popular 2012 book *The Social Conquest of Earth*. (Ironically, Hamilton himself had already in 1975 developed a multilevel selection model that demonstrated the equivalence of kin and group selection explanations. See Segerstrale, 2013, for Hamilton's actual views.)

The Social Conquest is a richly textured overview of human cultural evolution and particular turning points and their causes. It is also an examination of human nature and the human condition, and our special role as stewards of the earth. Without reneging on the genetic foundation of the epigenetic rules, Wilson identifies human ultrasociality as crucial for our success as a species (which in turn invites comparisons with other successful eusocial species—his beloved social insects).

One theme preoccupying Wilson throughout his academic life has been the relationship between science and religion. Brought up as a Southern Baptist but leaving the church and becoming an avid naturalist, Wilson was suspicious of religious preachings and earlier wanted to explain away religion with the help of science. Later (in *Consilience*), admitting that our metaphysical quest is part of human nature and that we have an innate need for beliefs and myths, he (rather surprisingly) suggested that evolutionary biology should provide the answers to our "why" questions, because evolutionary biology was the "best [i.e., most adaptive] myth we ever had." By now, he could also explain religion scientifically: The submission to a perceived higher power was just an expression of a more general, adaptive biological tendency. Wilson also attempted reconciliation with religious leaders, and in 2006, in *The Creation*, he even reached out to the creationists, inviting them to help him protect "the creation"—that is, all life on earth—as he continued raising global ecological awareness.

A unique feature of Wilson as a scientist is his tendency to operate in two modes, an objectivist and a normative one. In his objectivist mode, he treats evolutionary biology as a regular descriptive and explanatory science and defends it from political critics. In his normative mode, he feels free to derive values for mankind directly from evolutionary biology—a license not necessarily appreciated by his fellow scientists in evolutionary biology (and for them, it is beside the point that his explicit suggestions are typically liberal). At the same time, Wilson's many scientific contributions, synthetic efforts, and beautiful writing style have resulted in great acclaim both scientifically and in the public realm—among other things, the National Medal of Science, the Crafoord Prize, many other awards, and numerous honorary doctorates, as well as two Pulitzer Prizes.

Wilson, Monica

Monica Hunter Wilson was born on January 3, 1908, into a Presbyterian mission family at Lovedale, Eastern Cape, South Africa; she died a mere 20 miles away at her botanical garden on October 26, 1982. Between these two events, Wilson had a distinguished career as a social anthropologist and historian, focusing on issues of social change, family life, and religion among the Pondo, Xhosa, Nyakyusa, and Ngonde peoples of what are now South Africa, Tanzania, and Malawi, respectively.

Wilson received her university education at Fort Hare (a missionary institution serving African students) and Cambridge in history and anthropology. She also participated in Bronisław Malinowski's famous seminar at the London School of Economics; there she interacted with many of the great Africanist anthropologists of the time and strengthened her dedication to the study of social change. At the Rhodes-Livingstone Institute in Northern Rhodesia (now Zambia), she collaborated with her husband, the anthropologist Godfrey Wilson, until his tragic suicide in 1944 in reaction to the horrors of World War II. She became the first woman to be awarded a full professorship—in social anthropology—in not one but two South African universities—Rhodes University, Grahamstown (1947) and the University of Cape Town (1952). When she left Rhodes for the University of Cape Town in search of equal pay for equal work, Wilson succeeded Isaac Schapera as chair of the department.

Wilson maintained close ties with the people and places she had researched since the 1930s, including returning to Tanganyika (now Tanzania) in 1954 for additional fieldwork among the Nyakyusa. Her books include five ethnographies on the Pondo (*Reaction to Conquest*, 1936) and Nyakyusa (starting with *Good Company*, 1952, and ending with *For Men and Elders*, 1977). Wilson also coauthored *The Analysis of Social Change* (with Godfrey Wilson, 1945) and *Langa* (with Archie Mafeje, 1963), coedited the two-volume *Oxford History of South Africa* (with Leonard Thompson, 1969, 1971), and edited, completed, and wrote a memoir-epilogue, *Freedom for My People* (1981), on Z. K. Matthews, the Black South African anthropologist, lawyer, African National Congress leader (who first proposed the Freedom Charter), and diplomat. Among some 30 published articles, chapters, and distinguished lectures, Wilson's most influential pieces include the comparative "Witch Beliefs and Social Structures" (1951) and "Divine Kings and the Breath of Men," the Frazer Lecture of 1959. After her retirement in 1973, she continued a life of astounding anthropological contribution.

Critical Contributions to Anthropology

The Study of Social Change

Monica Wilson pioneered the analysis of social change and studied the effects of contact, conquest, missionization, and land scarcity at a time when most social anthropologists portrayed African societies as relatively static entities concerned with the social structure of "traditional" societies. Having moved from studying history to anthropology, she

was motivated to set the record straight by writing a less biased, more evenhanded account of the histories and people of her homeland. For Wilson, it was the anthropologists' duty to confront the full reality of the life of Blacks in South Africa. Her first book on the Pondo of the Eastern Cape, *Reaction to Conquest*, did just that, addressing life on Black reserves, White-owned farms, and towns. It is an extraordinary study on sexual socialization, love, marriage, and adultery in the context of social change and economic deprivation. More than 75 years after its publication, the book is remarkably relevant to the AIDS epidemic that has since engulfed South Africa.

With her husband, Godfrey Wilson, she wrote a book-length theoretical essay *The Analysis of Social Change*. They developed the concept of scale, exploring the implications for central and southern African peoples of changing from living in a small-scale society to a large-scale society. One aspect of the increase in scale was an increasing range of choices, affording both opportunities and challenges. She would return to these ideas 20 and 30 years later in subsequent essays investigating the zigzag nature of social change.

Wilson wrote four books on the Nyakyusa of what is now Tanzania, which focused on age-village systems, kinship, and ritual. The final book, *For Men and Elders*, combines her interest in history with the anthropological study of changing societal institutions. It spans a century of transformations in African family life, examining classic anthropological topics such as kinship, marriage, and inheritance. Sensitive to both social structure and emotions (e.g., in the role of friendship), Wilson investigates relations between generations (especially fathers and sons), genders (men and women), and age-mates.

Comparison, Conflict, and Coherence

Wilson was a professional observer; she stressed the importance of documentary evidence, whose value would endure even if modes of interpretation changed. Comparison across points of view and societies and drawing connections among different aspects of society, were likewise at the center of her work. "Divine Kings and the Breath of Men"—on Nyakyusa notions of vitality, cooperation, and conflict—illustrates her systematic way of proceeding from the intellectual climate, in which a set of ideas flourish, to the practical aspects of a particular institution, to historical context, and from the particulars of one society to comparative materials from other societies and eras. Analyzing "the breath of men," or public expression of anger, as a prelude toward the resolution of conflict, she wrote of the danger in South Africa of the absence of occasions on which Blacks can speak their minds to Whites.

Political Context

The political context of racially segregated South Africa and British colonialism produced challenges and fodder for Wilson's work. Opposition to her husband's pacifism during World War II as well as to their uncovering of unpalatable facts regarding urbanization at African mines led to Godfrey Wilson's resignation from the Rhodes-Livingstone Institute. Monica Wilson used evidence to dispute the notion that Afrikaners had arrived in an unpopulated land. She used comparison to demonstrate that tensions inherent in the social structure shape the form witch beliefs take, linking lessons from the Pondo and Nyakyusa to political witch hunts in the McCarthy era. With Mafeje, she studied a township whose residents launched protests against passbook requirements that severely limited Blacks' mobility outside their homelands. She spoke out against the establishment of Black homelands, migrant labor's effect on African family life, the increasing segregation in South African universities, and colleagues who had been banned via apartheid laws. Remaining in South Africa due to her commitment to offering liberal teaching in a repressive environment, she disliked and was suspicious of power but was not afraid to stand up to it. As a young widow, she raised her two sons in similar values. As her son Francis, a renowned labor economist, wrote, this remarkable anthropologist was a woman with a shadow, dignity, and the authority that derives from an integrated personality.

Wittfogel, Karl

Karl August Wittfogel's "hydraulic" theory strongly influenced anthropological theories of state formation during the 1950s and 1960s. Though his theory of the hydraulic state was partly derived from Karl Marx's and Friedrich Engels's writings, his theories had broad epistemological and political roots. Wittfogel studied Chinese history and developed a materialist theory accounting for the development and character of hydraulic societies that drew on Marxian materialist analytical principles, while critiquing communist societies as despotic social formations. His 1957 book *Oriental Despotism: A comparative study of total power* influenced a generation of mid-20th-century archaeologists and evolutionary cultural anthropologists, who drew on his work to explain the rise of pristine riverine states (e.g., that of ancient Egypt) and to develop a variety of ecological anthropological theories.

Karl Wittfogel was born in Woltersdort, Germany, on September 6, 1896. He was a member of the Communist Party from 1920 up to the early 1930s, and he studied critical Marxist theory at the University of Frankfurt's Institute for Social Research. In Frankfurt, he developed a traditional Marxist theoretical critique while specializing in the study of Chinese history. He expanded on Marx's and Engels's scant writings on the Asiatic mode of production to account for the formation of pristine and secondary nonfeudal despotic states throughout the world. His later writings became so mired in his personal anticommunist crusade that it can be difficult to disentangle his antitotalitarian vehemence from his theoretical contributions.

In his 1929 essay "Geopolitik, Geographischer Materialismus und Marxismus" (Geopolitics, Geographical Materialism, and Marxism), Wittfogel separated irrigation societies into three categories: the Egyptian type, the Japanese type, and the Indian type. The Egyptian type represented the classic, centralized hydraulic state with a large despotic, bureaucratic managerial base allowing hydraulic operations stretching for hundreds of miles. These massive irrigation works required the development of extensive centralized, often despotic, bureaucratic organization to coordinate distant hydraulic activities. The Japanese type represented small-scale—often limited to a single valley system—irrigation systems that cannot be intensified and expanded with centralized hydraulic management. The Indian type was characterized by independent, decentralized irrigation networks that must occasionally rely on a unified moderate- to large-scale labor force to construct and maintain the irrigation infrastructure.

In 1931, Wittfogel attended a conference in Leningrad, where he clashed with his hosts after the Soviet Communist Party denounced Marx's and Engels's theory of the Asiatic mode of production. Wittfogel interpreted the party's condemnation as a protective move designed to eliminate critiques within the party that the Soviet Union had become a despotic state. He returned to Germany, bitter over the Soviet rejection of the Asiatic mode of production, and though he resigned from the Communist Party in 1931, he was arrested as a communist after the Nazi administration came to power. He was imprisoned in several camps, including Esterwegen, from which Western scholars helped arrange his eventual release. He left Germany in 1934 for England, later traveling to China, where he conducted research from 1935 to 1937, before immigrating to the United States.

In 1940, Wittfogel married the anthropologist Esther Goldfrank and took research positions at Columbia University and the University of Washington, writing on the development of Chinese society. As the Cold War's American anticommunist fervor developed, he provided testimony to the U.S. Senate's International Security Subcommittee in an executive session and identified scholars whom he believed were communists or were spreading communist propaganda in the classroom. He testified against his colleague and former friend, Owen Lattimore, claiming that Lattimore was likely a communist. Among those whom Wittfogel named as communists were the historian Moses Finkelstein, a

former student at Columbia, and Herbert Norman, who committed suicide after Wittfogel publicly named him as a communist. After Norman's suicide, Wittfogel found himself increasingly isolated from the Columbia faculty, and he spent an increasing amount of time at the University of Washington. During the 1950s, Wittfogel and Goldfrank were repeatedly contacted by the Federal Bureau of Investigation (FBI), and FBI documents indicate that they provided the FBI with information on acquaintances whom they believed to hold views aligned with communism.

While maintaining an explicitly anticommunist critique, Wittfogel developed an explicitly materialist ecological theory exploring the similarities of pristine hydraulic states. David Price has argued that Wittfogel's unique position as an anticommunist cooperating with the FBI while undertaking Marxist-linked analysis provided a space in which he was one of the few openly materialist social scientists writing during the McCarthy period. During this period of isolation, Wittfogel increasingly worked on *Oriental Despotism* (1957), a work combining his interest in Chinese history with materialist conceptions of history.

Wittfogel's hydraulic theory sought to explain why the primary pristine states in world history emerged from societies located along massive river systems. *Oriental Despotism* presented a synthetic theory, drawing on historical examples from Egypt, Mesopotamia, and the Indus and Yangtze rivers to argue that the ecological, demographic, and technological conditions historically arose in the societies developing along these river systems, favoring the development of centralized bureaucratic systems that were initially needed to meet the administrative tasks required to manage dams, hundreds of miles of canals, and other elements of irrigation systems needed to increase the productivity of large irrigation systems stretching across large regions. These hydraulic societies developed intense, centralized bureaucratic governmental systems that highly concentrated state power.

Wittfogel argued that despite the obvious differences in local histories, technologies, language, religion, and other specific ideologies, the hierarchical bureaucratic structure of each of these hydraulic societies was remarkably similar—having arisen as solutions to the same ecologically based administrative needs.

Wittfogel's hydraulic theory did not claim that all irrigation-based societies would develop into centralized despotic systems. It recognized that small, localized irrigation systems would not increase productivity if they developed organizational structures reaching beyond local environments. He labeled such localized irrigation societies as hydro-agricultural societies. He argued that the scale and complexity of the massive irrigation systems (stretching for hundreds or thousands of kilometers) inevitably led to the rise of hydraulic oppressive states.

Wittfogel's contribution to a session at the annual meeting of the American Anthropological Association in 1953, organized by Julian Steward, was instrumental in bringing his work to the attention of anthropologists. In 1955, Steward organized a small conference at the University of Illinois, whose attendees included a core group of anthropologists whose work would later grapple with hydraulic theory or incorporate materialist forms of analysis. Robert McCormick Adams, Stanley Diamond, Morton Fried, Marvin Harris, Robert Murphy, and Eric Wolf were among the participants. Wittfogel's *Oriental Despotism* directly influenced the development of ecological anthropological approaches in the 1950s and 1960s.

Karl Wittfogel died in New York City on May 25, 1988.

Wittgenstein, Ludwig

Ludwig Wittgenstein (1889–1951), the Austrian/British philosopher of logic, mathematics, language, and mind, was one of the most important voices in philosophy in the 20th century.

Wittgenstein was born in Vienna to a wealthy Austrian family. After studying engineering in Berlin and Manchester, he moved to Cambridge, United Kingdom, at the recommendation of the logician Gottlob Frege, to study with Bertrand Russell and G. E. Moore. Recognized as a genius by both Russell and Moore, his first book, *Tractatus Logico-Philosophicus*, was accepted for a PhD degree in Cambridge in 1929 so as to enable him to take up a teaching position there. He became a professor of philosophy at Trinity College, Cambridge, in 1939 but resigned in 1947 to concentrate fully on his writing. Wittgenstein's work is usually divided between two different phases—the first providing a theory of language and its relation to the world on the model of logic and the second providing a philosophical therapy for puzzles that falsely arise in the quest for an ideal language.

This essay focuses on topics in Wittgenstein's later texts, especially *Philosophical Investigations* (*PI*) and the notes from a file box compiled in the book titled *Zettel*. Many social scientists are attracted to Wittgenstein's concept of "forms of life," taking its main contribution to be the recognition of the social character of human beings: But if we allowed the argument to rest at this point, there would be nothing original in Wittgenstein's philosophizing on the human. To do justice to the complex issues that Wittgenstein gathers under this concept, we must pay attention to both "form" as well as "life" in this expression.

To Have a Life in Language

The notion of life has recently reemerged in sociological and anthropological thought, often under pressure from new developments in the biological sciences. For Wittgenstein, though, the notion of life is not limited to biological or natural life, though it absorbs these notions of life. The fundamental questions for him seems to be the following: What can we say about the kinds of creatures we are, given that we have a life in language? How does the human use of language differ from the way signs are attributed to animals or plants? Consider the following remark (among many others):

> The dog *means* something by wagging his tail. What grounds would one give for saying that?—does one also say: "By dropping its leaves, the plant means that it needs water"? (*Zettel*, p. 521)

The intuition here seems to be that not everything that can be interpreted as a sign is imbued with meaning. For Wittgenstein, meaning occurs within a form of life in which intentions and expressions, the inner and the outer, the soul and the body are stitched or lined with each other. Thus, while we can imagine expressions such as "Oh, the plant is dropping its leaves; it is asking for water," this construction of the natural is evidence of how the natural might be absorbed in the social—it is not evidence of the plant's intention to convey a meaning to us. Two crucial aspects of our life with language follow. First, for Wittgenstein, words themselves have lives and can be robbed or emptied of life—becoming frozen, numb, and lifeless. Second, one indication that words have life is that they can be projected into new situations. Thus, Wittgenstein says (*Zettel*, p. 143) that what one means by "thought" is what is *alive* in a sentence, that a sentence would be a mere sequence of sounds or written shapes without this quality of life that animates it. He makes an analogy between circulation of words and circulation of money, suggesting that words that have gone dead are like paper money that cannot be used in the way in which real money can be used because there is no one to receive it. Another way in which Wittgenstein suggested that something is *alive* in words is contained in his remarks that our ability to project words in new contexts reveals something about their physiognomy. For instance, a word such as *ball*, he says, already contains shadows of other uses of this word, which makes it possible to use it in other sentences. But this quality of projection cannot happen independently of someone else's ability and willingness to receive words as meaningful when they are thus projected in new contexts.

The notion that words have life then relates to my acknowledgment of the presence of the other (to whom does it look like that?) who must be able

to receive my words and of a context that is in place (under what circumstances?). Words become dead when the contexts in which they could be received disappear. A speaker might utter the words, but life has been drained out of them.

Consider now the importance of projection for understanding our life with or in language. In his book titled *Claim of Reason*, Stanley Cavell offers the example of the word *feed*. I might "feed the cat" or "feed the lion," but I might also "feed the meter" or "feed your pride." What allows me to project the word in this manner? What does Wittgenstein mean when he says that the shadows of other uses of a word are already contained in its first (literal?) use? The thought here is that, first, such projections allow contexts to be stitched together and, second, they embody our grammatical sense of what anything, a machine or an emotion, might be. When I say that it is not easy to feed his pride, I give expression to the idea that pride is the kind of emotion that can be made to grow by flattery. This is a grammatical statement in the Wittgensteinian framework, in that it lays out the criteria for emotions such as pride. While other languages might not have the same verb-and-noun combination, the idea that some emotions can grow might be expressed through other grammatical forms—such as those of duration and physiognomy of emotions. Thus, one might say that grammar tells us what kind of object something like an emotion is. This, for Wittgenstein, is the difference between philosophical grammar and linguistic grammar.

If words have variance in their use, they also have internal constancy. This internal constancy is achieved within forms of life and not by some mechanical application of rules. It rests on collective and individual imagination, creativity, as well as natural disposition. Thus, for instance, one would not say "light as a stone," except in irony, because our experience of the natural is woven into the forms of life we lead with language.

Forms of Life

Two passages of crucial importance on the concept of form of life for our discussion are as follows:

> "So you are saying that human agreement decides what is true and what is false?"—It is what human beings *say* that is true and false; and they agree in the *language* they use. This is not agreement in opinions but in form of life. (*PI*, p. 241)

> What determines our judgment, our concepts, and reactions, is not what *one* man is doing *now*, an individual action but the whole hurly burly of human actions, the background against which we see any action. (*Zettel*, p. 567)

As these citations formulate it, human forms of life are defined by the fact that they are forms created by and for those who are in possession of language. Yet we must ask what Wittgenstein means by agreement being agreement in *form of life* and not simply an agreement in *opinions*. Let us take as our guide Stanley Cavell, who suggests a distinction between what he calls the ethnological or horizontal sense of form of life, emphasizing "form," and its vertical or "biological" sense, emphasizing "life." The first captures the notion of human diversity—the fact that social institutions, such as marriage and property, vary across societies. The second refers to the distinctions captured in language itself between the so-called lower or higher forms of life—between, say, poking at your food, perhaps with a fork, and pawing at it or pecking at it. However, it is important to understand that the biological is not taken here as something "given"; rather, we show our agreements in what might be considered natural from within our form of life by not only *what* we say but *how* we say it. The limits of the human body or the human voice are not given in advance, but neither is it purely a matter of opinion as to whether a slave is human or whether a man committing acts of atrocity is human or a machine. Cavell (1976) expresses this thought by saying that in our everyday actions, we show that we understand slaves to be humans:

> When he wants to be served at table by a black hand, he would not be satisfied to be served by a black paw. When he rapes a slave . . . he does not feel that he has by that fact itself, embraced sodomy. When he tips a black taxi driver . . . it does not occur to him that he might more appropriately have patted the creature fondly on the side of the neck. (p. 377)

Cavell's understanding of the concept of form of life shows that we are not simply socially conditioned but that our criteria go deeper than official representations of who counts as a person and who counts as a slave. The injustices and oppression inflicted by the social order through its laws or

through its commercial practices that fix the jural status of slaves as nonhumans do not completely socialize one into their treatment as nonhumans, which is what makes it possible for criticism to emerge. The point is that the source of criticism lies not simply in rational deliberative forms in which one would debate opinions about whether a slave is a human being or not but in the manner in which a certain history of the natural is embedded in everyday gestures of the kind that Cavell describes, which show that I relate to this person as a human being. This view of forms of life has a significant impact on what we might call Wittgenstein's picture of culture.

If one were to take away the nuances that come from a step-by-step development of the idea of culture in Wittgenstein, then, he argues, culture is not given once and for all but is rather continuously made in the act of individuals trying to imagine the paths of their lives in light of the lives of the words, concepts, and practices of their cultures. *PI* opens with a paragraph from Augustine, in which he describes how a child learns what is the proper use of language:

> When they (my elders) named some object, and accordingly moved toward something, I saw this and I grasped that the thing was called by the sound they uttered when they meant to point it out. . . . I gradually learnt to understand what objects they signified; and after I had trained my mouth to form these signs, I used them to express my own desires.

The signal importance of these opening lines in Wittgenstein lies in the fact that he gestures toward the idea of culture as the scene of both inheritance and education. The figure of the child that haunts this text and the various scenes of instruction (of learning to read and of learning to project numbers) show the limits of thinking of culture as simply a set of rules or of shared values that have to be imbibed—they gesture powerfully toward the processes through which people learn not only to make words of their cultures their own but also to confront what they regard as their culture with their imagination of their own words and their lives. The essential point here is to see that for Wittgenstein, the process of coming to own one's experience is neither a simple act of resistance to the norms of one's culture nor an act of simple acceptance; rather, it is through education that people learn and create the shape of agreements and attunements to their cultures. It follows that, against the claims that Wittgenstein was a conservative, a deeper reading of *PI* suggests that claims to one's culture rest on being able to find one's voice within it, both as a gift and as a rebuke.

Wittgenstein's Influence on Anthropological Theory

Wittgenstein's influence on anthropological theory might be seen in three main areas. First, his argument against the possibility of private language led to an understanding of meaning as social and public rather than individual and private and inaugurated the interpretive turn in cultural anthropology. Second, his remarks on Frazer have been productive for rethinking the question of not only what made rituals efficacious but also what gave them depth within a form of life. Wittgenstein's demonstration of the difference between the first-person and third-person perspective on the category of belief led to a serious critique of the anthropological modes of rendering beliefs of other societies as simply collective representations. Finally, Wittgenstein's radical reformulation of everyday life as both a site of trance and illusion, and a cure for metaphysical emptiness opened up new ways of thinking about the everyday as more than the site of routine and habit. Earlier, impoverished readings of Wittgenstein, which interpreted *PI* as endorsing the view that different languages, cultures, and communities were like hermetically sealed units, have fortunately been discarded through readings of his texts that are more attuned to the multiplicity of voices in his texts (especially *PI*) as well as through attention to form, tone, and pitch in his writing.

Wolf, Eric

Eric R. Wolf (1923–1999) was a leader among anthropologists seeking to address new problems following World War II: restive peasantries, nation-state coherence, the turmoil of capitalist and colonial expansion, and the role of power in culture. Ecumenical in approach, he lamented the specialized trajectories that had drawn history and the social sciences away from political economy, as well as the boundaries that separated the subfields of anthropology. This discipline, Wolf maintained, is the most scientific of the humanities and the most humanist of the sciences; it requires an ongoing dialogue between the rationality of the Enlightenment and the emotion-laden tenor of everyday life.

A principled and politically engaged scholar, Wolf was sympathetic to Marx's vision of political economy, with its emphasis on labor and production. Boyhood exposure to the ravages of the Great Depression in a textile factory managed by his father; his youthful escape from the Nazi subjugation of Vienna, where he had grown up in a secular Jewish household; and his encounter with the German sociologist Norbert Elias in an English internment camp contributed to this sensibility, as did his eventual immigration to New York and combat experience with the U.S. army in fascist Italy. Pursuing a PhD from Columbia University under the G.I. Bill, Wolf was among a cohort of student veterans who rejected anthropology's then reigning paradigm, according to which each people has "a" culture—coherent, bounded, and outside history. Together, they discussed historical texts influenced by Marx and welcomed the arrival of the cultural ecologist Julian Steward. A member of Steward's Puerto Rico project, Wolf explored the vulnerability of struggling coffee growers in the Central Highlands to world commodity prices.

Early Work

Wolf's subsequent work focused on nation-states and peasantries, new territory for anthropology. In a 1953 essay, Wolf reflected on the ecological bases of European states, shown to be riven not only by ethnic claims but also by divisions between industrial and agrarian complexes. The cultural integration of such states into single "nations" was necessarily fraught and often violent, a case in point being Germany. Turning to Mexico, Wolf found that "interstitial power brokers" were pivotal contributors to national coherence. His 1956 article on "group relations in a complex society" examines cliques of sometimes violent "politician entrepreneurs" who, manipulating patron-client relations, transformed Mexico's Institutional Revolutionary Party into a holding company for local interests. A 1958 essay analyzes how mainly mestizo brokers propagated the myth of the Virgin of Guadalupe as a unifying national symbol. *Sons of the Shaking Earth* (1959), Wolf's first book, taps archaeological and historical knowledge to reconstruct Mexico's indigenous polities, their differential subjugation to Spanish colonizers, and their differentiated participation in the Mexican Revolution. The book reveals Wolf's signature method: comparative study of carefully chosen empirical cases so as to analyze the effects of convergent, divergent, and interactive historical processes on culture change.

Comparison informed Wolf's pioneering work on peasants. "Closed Corporate Peasant Communities" (1957) juxtaposes peasants in central Java with those in highland Mesoamerica, whose villages alike exhibited communal land jurisdiction, restrictive membership, and wealth-leveling institutions. These patterns, Wolf theorized, constituted responses to similar experiences of land and labor appropriation by the colonizing Europeans. *The Hidden Frontier* (1974, coauthored with John Cole) presents two villages in south Tyrol that shared the same Alpine ecology but exhibited different languages and a different ideology of inheritance. Here, historical subjugation to contrasting (specifically Austro-Hungarian and Italian) political regimes led to contrasts in ethnic identity and in the uses to which ethnicity was put.

Besides comparison, Wolf's early work displayed his interest in "culture-as-historical process"—a theoretical orientation opposed to the "culture-and-personality" school taught by Ruth Benedict at Columbia. Against her claim that whole societies, like the Kwakiutl, the Zuni, or the Dobu, and even whole nation-states, like Japan or Russia, could be characterized by discrete clusters of traits reproduced through the psychological conditioning of children, Wolf promoted Anthony Wallace's 1961 proposition that culture is about "the organization of diversity" rather than "the replication of uniformity." An extended essay of 1964, "Anthropology," elaborates on Elias's insight that in 19th-century Germany there had emerged a lay understanding of *culture* as different from, and in tension with, *civilization*. The first term meant something down home and "ours," the second something cosmopolitan and "theirs," for example, the French. Boas, Wolf argued, had imported an understanding of culture forged through pushback against the Enlightenment into American anthropology, where it found a home among the psychologically oriented next generation of Boasians, including Benedict.

For Wolf, ever wary of nationalism's excesses, the romantic view of culture as interior and "ours" had come to the fore in Europe at a time when some European nations were contending for dominance while others had yet to achieve separate identities and political independence. The idea that each "nation" was animated by a distinctive emotional profile shored up the aspirations of nations becoming states. Charting a different course, Wolf's 1966 essay, "Kinship, Friendship and Patron-Client Relations in Complex Societies" reconsiders Mexico's power brokers as an instance of the "upward circulation" of "interpersonal sets," as contrasted with the "downward circulation" of courtly manners in France or public school manners in England. Although the models of etiquette characteristic of each case are particular, they do not define national character so much as point to different "parallelograms of social forces."

Peasants and *Peasant Wars of the Twentieth Century*

Not surprisingly, Wolf criticized Robert Redfield for depicting peasant culture as value saturated, timeless, and homogeneous. In *Peasants*, his landmark 1966 book, he defined peasants rather as "rural cultivators whose surpluses are transferred to a dominant group of rulers" and whose culture is formed out of complex interactions with wider fields of power. Households, usually patriarchal, committed the energy and emotions of their constituents to provide for subsistence, the required surpluses, and an annual round of ceremonies necessary to ensure their reproduction—and reputation—over time. In a theoretical move that anticipated gender studies, Wolf attributed men's dominance over these imperatives to the social support they received from external (ceremonial and economic) contexts. In addition, he theorized why the family looms large in peasant communities: Small in scale, flexible, and self-exploiting, it is an ideal institution for confronting the unpredictable pressures that peasants face.

Beyond the family, peasants generate both "horizontal" and "vertical" sociocultural groupings. Comparing horizontal forms—for example, mutual aid and burial societies, labor exchanges, Latin American fiesta systems, or southeast Chinese *tsu* or clans—Wolf reveals how they contribute to the ongoing viability of households, only episodically and contingently diverting energy from them. He also compared vertical forms connecting households with the landlords, urban elites, and state officials who collect their rents. Among them, Wolf found networks, spun from relations of kinship, friendship, co-god-parenthood, and patronage, to be especially salient. Capable of bridging highly unequal social positions, such "webs" (as he also called them) engage the powerful and powerless in habits of exchange. Whether horizontal or vertical, peasant sociocultural forms participate in wider histories, shielding cultivators from erratic prices, new demands on their surplus, or appropriations of their land, all the while lending cultural content to national integration.

In the second half of the 1960s, Wolf researched six cases of peasant revolution, examining the historical engagement of rural cultivators with capitalist markets and colonial overlords and their stratification into landed, landless, and "middle" or "small-holding" peasants. In each case, the middle category, together with indigenous intellectuals and professionals, contributed disproportionately to revolutionary activity. In *Peasant Wars of the Twentieth Century* (1969), Wolf discusses this finding in terms of the greater sociocultural stability of middle peasants; especially in peripheral regions, the cushion of horizontal and vertical groupings reduced the risk

to middle peasant families of fighting for the cause. The book appeared shortly after Wolf's seminal leadership in the first teach-in against the Vietnam War in 1965 and on the eve of his role, with Joseph Jorgensen, in the American Anthropological Association's Ethics Committee's investigation into the use of ethnographic data for counterinsurgency purposes in Southeast Asia.

Europe and the People Without History

A commitment to comparative methods, an approach to sociocultural forms that privileges open-ended webs of connection over discrete and bounded wholes, and an insistence on analyzing these forms in relation to large-scale historical processes were foundational for Wolf's major opus, *Europe and the People Without History* (1982). The book uses Marx's mode of production concept to illuminate three ways of mobilizing social labor—kin ordered, tributary, and capitalist. Eschewing the typological fixity of the French structural Marxists, Wolf views each as internally varied and dynamic, replete with its own engines of power and wealth accumulation, structures of social inequality, and ideological justifications. Kin-ordered and tributary modes, alone and in interaction, are shown to change and grow no less than restless capitalism, although the comparison dramatizes capitalism's far greater impact. Turning land, labor, and capital into commodities (Wolf followed Karl Polanyi here), forever pulling up stakes in one place to penetrate others, in love with technological innovation, the capitalist mode even threatens the capacity of power holders to wield and maintain power. Most important, through the imperial projects of competing European nation-states, capitalism's churning effects overflowed the world. Ironically titled, *Europe and the People Without History* analyzes the histories of Native Americans on the "commodity frontier" of the fur trade, slaves and indentured servants coercively recruited to toil on plantations, and uprooted peasants migrating to swell an industrial proletariat.

Europe and the People Without History constitutes a tour de force of world histories, and at the same time, it clarifies how Wolf conceptualized culture in relation to power. Note his ambivalent use of the word *structure*, an architectural metaphor that is sidelined in favor of metaphors from physics such as *vectors* and *forces*. Nor do forces come across as abstract or disembodied; like a good historian, Wolf is specific about the agendas of particular militarized chiefdoms, merchant and industrial companies, banking houses, political regimes, revolutionary cabals, and so on. Clearly for him, it is human projects emerging from fields of political-economic-ideological competition that move and shake the world. A subsequent essay, "Facing Power" (1990), delineates four kinds of power—individual potency or capability, the imposition of one's will on others, the tactical operations of more or less organized groups, and power that, through strategically deployed ideology, organizes the political economy.

Unlike many who have followed Marx, Wolf does not treat ideology as superstructure; rather, he brings to light how dominant power holders work tirelessly to ritualize and disseminate power-laden messages across all levels of society. Through what he called "acculturation," but later acknowledged could be labeled "hegemony," holders of power both institutionalize their positions and relegate challenges to a realm of disorder and chaos. Ideology, a rigid manifestation of culture, is thus implicated in the very operations of power, its task being to forestall erosion and keep alternatives at bay. But resistance to power also rests on culture building, including emotionally laden bodily and aesthetic dimensions reinforced through ritual. Although skeptical of oppositional agency, Wolf closely observed how contrary mobilizations such as "peasant wars" unfold: how they elicit participation, retain commitment, and sometimes actually reshape cultural repertoires and images. In the "rough and tumble" of social life, states a well-known passage in *Europe and the People Without History*, groups exploit inherited forms, perhaps imparting new meanings to them. They borrow forms that better express their interests or create entirely new forms that answer to new circumstances. Cultures are in effect processes that "construct, reconstruct, and dismantle" cultural materials in response to "identifiable determinants."

Europe and the People Without History appeared just as anthropologists were charting their postmodern turn, a rupture that not only relegated Marx, so important to Wolf's intellectual trajectory, to a secondary place in the widening firmament of critical theorists but also subjected him to close reading as the author of a "Euro-centric master narrative." The reception of Wolf's major work was inevitably shaped by this unfolding paradigm shift. According

to the critics, he had dwelled in the material world at the expense of appreciating the autonomy of ideas; had treated capitalism as a steamroller, obliterating all in its path; had pursued causality as if a predictive science of society were possible; and had failed to acknowledge the desire for, and magic of, commodities because of a "productionist" bias.

Envisioning Power

In answering these criticisms, Wolf defended an epistemological empiricism and commitment to explanation—to the comparative reconstruction of historical trajectories to answer big questions—while also considering the role of ideation in human interactions more deeply. His last book, *Envisioning Power: Ideologies of Dominance and Crisis* (1999), reiterates his earlier criticism of anthropology's romantic approach to culture. But it also charts new ground. It had been Wolf's lifelong project to analyze Nazism, which had so marked his youth in Europe. In *Envisioning Power*, he juxtaposes the Third Reich with other instances familiar to anthropologists, in which economic, demographic-ecological, and military collapses produced severe anxiety about future viability, leading people to succumb to cosmic and frenzied ideologies—specifically Aztec human sacrifice, extreme Kwakiutl potlatching, and, more broadly, nativist movements like Cargo Cults and Ghost Dances.

As *Envisioning Power* makes clear, "interested" groups are not expressions of narrow economic positioning; each is rather a complex, internally differentiated, and erratically bounded formation embarked on creating and maintaining a semblance of order in the midst of destabilizing interactions with the outside world. Because some of these interactions rattle the very foundations of people's livelihoods, cultural processes invariably address deeply potent themes: social reproduction (family roles, gender relations, and personhood), precedence and hierarchy (descent, authority, rank, rulership, class, and race), and existential insecurity (the spirit world). Material elements and the "free-floating zig-zags" of the mind are alike involved. Among the "identifiable determinants" that call forth such themes are mayhem-inducing natural disasters, epidemics, reconfigured trade routes, imperialist intrusions, technological innovations, and the devastating crack-ups of capitalism.

In many respects, this power-saturated theory of culture resonated with the theories of Antonio Gramsci, Michel Foucault, and Pierre Bourdieu, who superseded Marx for many anthropologists (and whom Wolf credits for contributions to his thinking in *Envisioning Power*). All were skeptical that commonalities of language and custom, traditions and ways of being, automatically signal sentiments of identity and social solidarity, viewing them rather as held in place by discourses and practices of vastly unequal power. All, especially Foucault and Bourdieu, shared Wolf's caution with regard to "agency." Yet, with the partial exception of Gramsci, Wolf was uniquely obsessed with *how* diversity gets organized, that is, with the social agents who "install and defend institutions and organize coherence." In *Envisioning Power*, "ideological managers" from charismatic shamans to Nazi communicators are shown to use performative skills to bestow meanings, name things, and energetically overrule contrary interpretations.

Wolf as a Theorist of Culture and Power

Although Bourdieu wrote evocatively about North Africa, he, and Gramsci and Foucault, took as their objects of analysis the complex societies of the capitalist West. So, too, did Wolf. Ever the anthropologist, however, he also wanted to know how culture and power interact in small-scale societies, past societies, even "pre-historical" societies as revealed by archaeology. Other theorists would not so easily compare the cosmic excesses generated by the Kwakiutl, the Aztecs, and the Nazis during their respective encounters with terrifying societal meltdowns. This raises another respect in which Wolf stands out among theorists of culture and power. He was haunted by the ever-lurking possibility of chaos. Such a dark understanding of culture—otherwise appreciated for creativity and beauty and, indeed, for ordering and giving meaning to life—comes across especially strongly in "Perilous Ideas: Race, Culture, People" (1994), an essay honoring Sidney Mintz, which assimilates cultural essentialism with racism and ethnic cleansing. That Wolf had a theory of culture centered on process and power—that the theory embraced all of the world's peoples, drew attention to charismatic communicators, and took account of the hugely destabilizing effects of unforeseen crises—makes it a salient framework for our time.

World-Systems Theory

The world-systems perspective is a strategy for explaining institutional change that focuses on whole intersocietal systems rather than single societies. The main insight of the world-systems perspective is that important interaction networks (trade, information flows, alliances, and fighting) have woven polities and cultures together since the beginning of human sociocultural evolution. These intersocietal interaction networks were rather small when transportation was mainly a matter of hiking with a pack. However, globalization, in the sense of the expansion and intensification of larger economic, political, military, and information networks, has been increasing for millennia. The world-systems perspective explains institutional change with regard to these intersocietal systems (world systems).

The idea of the *whole system* means that all the human interaction networks, both small and large, from the household to global trade, constitute the world system. It is not just a matter of "international relations" or global-scale institutions, such as the World Bank. Rather, at the present time, the world system is nearly all the people of the earth and all their cultural, economic, and political institutions and the interactions and connections among them. The world-systems perspective looks at human institutions over long periods of time and employs the spatial scales that are required for comprehending these whole interaction systems. Interaction networks have become larger with the development of technologies of transportation and communications, and so small, regional world-systems have expanded and merged to become the earthwide system of the present. In their 1997 *Rise and Demise: Comparing World-Systems*, Christopher Chase-Dunn and Thomas D. Hall adapted the concepts that have been developed for studying the modern world system for use in the comparison of the modern system with earlier systems and for the study of long-term sociocultural evolution. Archaeologists have also used world-systems concepts for studying premodern systems. In their 2011 work, Hall, Nick Kardulias, and Chase-Dunn review the research and debates that archaeologists have contributed.

The intellectual history of world-systems theory has roots in classical sociology, Marxian political economy, geopolitics, and anthropological theories of sociocultural evolution. But in explicit form, the world-systems perspective emerged only in the 1970s, when Samir Amin, Andre Gunder Frank, and Immanuel Wallerstein began to formulate the concepts and to narrate the analytic history of the modern world system.

A System of Stratification

The modern world system can be understood structurally as a stratification system composed of dominant core societies (themselves in competition with one another) and dependent peripheral and

semiperipheral regions, a few of which have been successful in improving their positions in the larger core-periphery hierarchy, while most have simply maintained their relative positions.

This structural perspective on world history allows us to analyze the cyclical features of institutional change and the long-term patterns of development in historical and comparative perspective. Human economic, political, social, and cultural institutions are socially constructed, so this entry uses the term *social* as shorthand for all of these. By "sociocultural evolution" is meant a process of patterned change that is distinct from biological evolution because it is based on the intergenerational transmission of information by means of language instead of genetic inheritance.

Core and Periphery

We can see the development of the modern world system as driven primarily by capitalist accumulation and geopolitics, in which businesses and states compete with one another for power and wealth. Competition among states and capitals is conditioned by the dynamics of struggle among classes and by the resistance of peripheral and semiperipheral peoples to domination and exploitation from the core. In the modern world system, the core is Europe, the United States, and Japan, while the semiperiphery is composed of large and powerful countries in the Global South (e.g., Indonesia, China, Mexico, India, and Brazil) as well as smaller countries that have intermediate levels of economic development (e.g., Taiwan, South Korea, South Africa, Israel, Venezuela). It is not possible to understand the history of institutional change without taking into account both the strategies and technologies of the winners and the strategies and forms of struggle of those who have resisted domination and exploitation.

World-systems scholars contend that leaving out the core-periphery dimension or treating the periphery as inert are grave mistakes, not only for reasons of completeness but also because the ability of core capitalists and their states to exploit peripheral resources and labor has been a major factor in deciding the winners of the competition among core contenders. And the resistance to exploitation and domination mounted by noncore peoples has played a powerful role in shaping the evolution of global governance. Thus, world history cannot be properly understood without attention to the core-periphery hierarchy.

A hegemon is the most powerful state in a system of states, and as made clear by Antonio Gramsci, hegemony must be based on a combination of coercion and consent. In the modern world system, the hegemons (the United Provinces of the Netherlands in the 17th century, the United Kingdom of Great Britain in the 19th century, and the United States in the 20th century) have been capitalist core states that have succeeded in getting ahead of the competition in profitable new lead industries as well as providing stability and global leadership.

It is also difficult to understand why and where innovative institutional change emerges without a conceptualization of the world system as a whole. New organizational forms that transform institutions and lead to upward mobility most often emerge from societies in semiperipheral locations. Thus, all the countries that became hegemonic core states in the modern system had formerly been semiperipheral (The Netherlands, England, and the United States). This is a continuation of a long-term pattern of sociocultural evolution that Chase-Dunn and Hall have called "semiperipheral development." Semiperipheral marcher states and semiperipheral capitalist city-states had acted as the main agents of empire formation and commercialization for millennia. This phenomenon arguably also includes organizational innovations in contemporary semiperipheral countries (e.g., Mexico, India, South Korea, Brazil, and Venezuela) that may transform the now global system.

This approach requires that we think structurally. We must be able to abstract from the particularities of the constantly changing situations that constitute uneven development to see the structural continuities. The core-periphery hierarchy remains, though some countries have moved up or down. The interstate system remains, though the internationalization of capital has further constrained the abilities of states to structure national economies. States have always been subjected to larger geopolitical and economic forces in the world system, and as is still the case, some have been more successful than others at exploiting opportunities and protecting themselves from liabilities.

Understanding Globalization

In this perspective, many of the phenomena that have been lumped under the term *globalization* correspond to recently expanded intercontinental trade,

financial flows, and foreign investment by transnational corporations and banks. However, globalization is more than just an economic process. Cultural, political, and social interaction networks and shared discourses have also become more integrated on a global scale. Much of the globalization discourse assumes that until recently there were separate national societies and economies and that these have now been superseded by an expansion of international integration driven by information and transportation technologies. Rather than a wholly unique and new phenomenon, globalization is primarily international integration, and as such, it is a feature of the world system that has been oscillating as well as increasing for centuries. For example, the great chartered companies of the 17th century played an important role in shaping the development of world regions 400 years ago, and there was a great wave of international economic, political, and cultural globalization in the 19th century. Certainly, the transnational corporations of the present are much more important players, but the point is that "foreign investment" is not an institution that only became important since 1970 (or since World War II). Giovanni Arrighi has shown that finance capital has been a central component of the world system since the 14th century. The current floods and ebbs of world money are typical of the late phase of very long "systemic cycles of accumulation." In their 2000 study, Chase-Dunn, Yukio Kawano, and Benjamin D. Brewer empirically demonstrated the cyclical nature of these waves with time-series data on international trade globalization.

Phillip McMichael has studied what he calls the "globalization project" that emerged in the 1980s—the abandoning of Keynesian models of national development and a new (or renewed) emphasis on deregulation, privatization, and opening of national commodity and financial markets to foreign trade and investment. The term many prefer for this turn in global discourse is *neoliberalism*, but it has also been called "Reaganism/Thatcherism" and the "Washington Consensus." The worldwide decline of the political left predated the revolutions of 1989 and the demise of the Soviet Union, but it was certainly also accelerated by these events. The structural basis of the rise of the globalization project was the new level of integration reached by the global capitalist class and a crisis of overproduction and lower profits when Japan and Germany finally caught up with the United States in manufacturing. The internationalization of capital has long been an important part of the trend toward economic globalization. And there have been many claims to represent the general interests of business before. Indeed, every modern hegemon has made this claim. But the real integration of the interests of capitalists all over the world has very likely reached a level greater than at the peak of the 19th-century wave of globalization.

Recent Developments and Future Challenges

The world system has now reached a point at which both the old interstate system, based on separate national capitalist classes, and new institutions representing the global interests of capital are powerful simultaneously. As William Robinson has argued, in this light each country can be seen to have an important ruling class faction that is allied with the transnational capitalist class. The big question is whether or not this new level of transnational elite integration will be strong enough to prevent competition among firms and national states from turning into warfare, as it has always done in the past, during a period in which the hegemon (now the United States) is declining and economic growth is slow.

The insight that capitalist globalization has occurred in waves, and that these waves of integration are followed by periods of de-globalization, has important implications for the immediate future. Capitalist globalization increased both intranational and international inequalities in the 19th century, and according to Volker Bornschier, this process has continued in the late 20th century and early 21st century. Growing inequalities and slow economic growth have caused world revolutions in the past and are causing another one now.

Early skirmishes of the current world revolution occurred in the anti–International Monetary Fund riots in the 1980s, followed by the Zapatista revolt in 1994 and the so-called Battle of Seattle in 1999. There was a short hiatus caused by the terrorist attacks on the United States in 2001, but this was followed by the huge meetings of the World Social Forum, the Pink Tide populist regimes in Latin America, the Arab spring, the European anti-austerity summer, and the Occupy movement that began in the fall of 2011.

There is a tension between those who advocate de-globalization and delinking from the global capitalist economy and the building of stronger, more cooperative, and self-reliant local and national social relations, on the one hand, and those who seek to build new, or reformed, institutions of democratic global governance, on the other. Self-reliance is an understandable reaction to exploitation and insecurity, but it is not likely to solve the major problems that will confront humanity in the 21st century: ecological degradation, rising levels of conflict, and huge North/South inequalities. The great challenge of the 21st century is the building of a democratic and collectively rational global commonwealth. World-systems theory will be an important contributor to this project.

Wundt, Wilhelm

Wilhelm Wundt (1832–1920) was one of the important precursors of cultural anthropology in the German-speaking countries. His research and lectures at Leipzig University were inspiring for anthropologists all over Europe, including eminent anthropologists like Franz Boas, Émile Durkheim, and Bronisław Malinowski, who visited Leipzig and attended his lectures.

Born in Mannheim, Germany, Wundt studied medicine in Heidelberg and Berlin. After professorships at Heidelberg and Zurich, he was appointed professor of philosophy at Leipzig in 1874. One year later, he received an honorary degree of doctor of philosophy at the same university. In 1879, he founded the Institute of Experimental Psychology at the University of Leipzig, and he may thereby be acclaimed as one of the founding fathers of psychology. However, his particular interest was in *Völkerpsychologie*, a term first used by Wilhelm von Humboldt and subsequently, in 1851, by Moritz Lazarus, who even founded a journal with the title *Journal for Völkerpsychologie*. For Wundt, this term provided the fundamental concept for a new science that was related to the cultural anthropology of that time (called *ethnology*) but distinguished, as Wundt claimed, in its objective: to explain the variety of peoples and cultures not only by their features and geographical emplacement but also through people's "physical and spiritual habitus." Wundt considered cultural anthropology a historical science, whereas his interest was in the natural foundation of cultures and their mental prerequisites. Wundt first published on the topic in 1888, in a short article titled "Ways and Aims of Völkerpsychologie." From 1900 to 1920, he published his monumental 10-volume work titled *Völkerpsychologie*. Starting with his most basic argument, which assumes that

the physiology and psychology of man are united through the unity of experience, his approach includes an evolutionary perspective, assuming that the core elements of culture develop in accordance with the psychological dispositions of people. Thus, language, mythology, customs, and religion differentiate in tandem with the increasing complexity of mental faculties. For each of these domains, Wundt identifies stages of complexity—for example, from simple clauses to relative clauses or from ideas about the soul to more complex religious practices.

Wundt's original approach was the association of man's mental-psychological properties with culture. He believed that culture and history were considered ephemeral, whereas psychological explanations revealed the proper causes of cultural development. Wundt attracted many scholars during his lifetime. The integration of the mental and the cultural were very appealing in the world of 19th-century philosophy, and his background in experimental psychology seemed to provide a solid empirical foundation for his theories. However, after his death, the idea of *Völkerpsychologie* lost its appeal. One reason for its rejection was its inherent evolutionism. A second reason was the mixing together of the mental and the social. On this point, Durkheim insisted that the sphere of the social should be separated from the mental sphere. Wundt's ideas were unacceptable because they questioned the autonomy of the social and cultural sciences.

The relation between Malinowski's ideas and those of Wundt is much less clear. We know that Malinowski's stay in Leipzig played a crucial role in his turn toward anthropology and that he attended Wundt's lectures. But there is no record indicating how he evaluated Wundt's approach. Perhaps Malinowski's conception of rituals functioning to relieve stress can be related to Wundt's association of the mental with the social. This may be concluded from Bernhard Streck's assumption that Malinowski's concept of need is based on Wundt's emphasis on volition as key to human character. It had also been claimed that Wundt was a forerunner of the Culture-and-Personality school, although eminent authors like Margaret Mead never referred to Wundt. In spite of its unanimous rejection even among German-speaking anthropologists, there have been racist psychologists, like Ludwig Ferdinand Clauss, who used *Völkerpsychologie* as a basic concept for their arguments about the character of races and became promoters of the Nazi ideology.

Chronology of Theory in Anthropology

300s BCE	Plato's and Aristotle's works are published.
1090s CE	Oxford University founded.
1209	Cambridge University founded.
1651	Thomas Hobbes publishes *Leviathan*.
1748	Comte de Montesquieu publishes *The Spirit of the Laws*.
1755	Jean-Jacques Rousseau publishes *Discourse on the Origin and Basis of Inequality Among Men*.
1767	Adam Ferguson publishes *An Essay on the History of Civil Society*.
1776	Adam Smith publishes *The Wealth of Nations*.
1798	Thomas R. Malthus publishes *An Essay on the Principle of Population*.
1818	Georg W. F. Hegel becomes chairman of philosophy at the University of Berlin.
1851	Great Exhibition of 1851 (Crystal Palace), London.
1859	Charles Darwin publishes *On the Origin of Species*.
1861	Johann J. Bachofen publishes *Das Mutterrecht*.
	Adolf Bastian travels in Southeast Asia.
1865	John Lubbock publishes *Prehistoric Times*.
	John McLennan publishes *Primitive Marriage*.
1867	Karl Marx publishes the first volume of *Capital*.
1869	American Museum of Natural History founded.
1871	Anthropological Institute (after 1907 The Royal Anthropological Institute) founded.
	Edward Burnett Tylor publishes *Primitive Culture*.
1875–1885	Herbert Spencer publishes *The Principles of Sociology*.
1877	Lewis Henry Morgan publishes *Ancient Society*.
1879	Wilhelm Wundt founds the Institute of Experimental Psychology at the University of Leipzig.
1881	Death of Lewis Henry Morgan.
1882	Death of Charles Darwin.
1884	Edward Burnett Tylor appointed Reader at Oxford University.
	Pitt Rivers Museum founded at Oxford University.
1890	First publication of James G. Frazer's *The Golden Bough*.
1893	Chicago World's Columbian Exposition.

1895	Émile Durkheim publishes *The Rules of Sociological Method*.
1898	Alfred C. Haddon leads the Cambridge Anthropological Expedition to the Torres Straits.
	L'Année Sociologique begins publication in Paris.
	Leo Frobenius publishes "The West African Culture Circle."
1899	Franz Boas appointed Professor of Anthropology at Columbia University.
	Sigmund Freud publishes *The Interpretation of Dreams*.
	Thorstein B. Veblen publishes *The Theory of the Leisure Class*.
1900	Alfred C. Haddon becomes university lecturer in ethnology at Cambridge University.
1901	Anthropology department and museum founded at University of California, Berkeley. Alfred. L. Kroeber hired as assistant professor.
1902	American Anthropological Association founded.
	Émile Durkheim becomes chair of education at the Sorbonne.
1903	Death of Herbert Spencer.
	W. E. B. Du Bois publishes *The Souls of Black Folk*.
1904	Edward Westermarck becomes first lecturer in anthropology at the London School of Economics.
1909	Arnold van Gennep publishes *The Rites of Passage*.
1910	Lucien Lévy-Bruhl publishes *Les fonctions mentales dans les sociétés inférieures* (How Natives Think).
1912	Émile Durkheim publishes *The Elementary Forms of the Religious Life*.
1915	Bronisław Malinowski makes his first trip to the Trobriand Islands.
1916	Edmund Husserl becomes professor of philosophy at the University of Freiburg.
	Edward Sapir publishes "Time Perspective in Aboriginal American Languages: A Study in Method."
	Elsie Clews Parsons makes her first field trip to Zuni.
	Ferdinand de Saussure's students publish *Cours de linquistique general*.
1917	Death of Edward Burnett Tylor.
	Death of Émile Durkheim.
1918	Laura Spelman Rockefeller Memorial established.
1922	Bronisław Malinowski appointed lecturer at the University of London.
1923	Frankfurt Institute for Social Research founded (generally associated with the Frankfurt School).
1925	Institute of Ethnology of the University of Paris founded.
	Marcel Mauss publishes "An Essay on the Gift: Forms and Reasons of Exchange in Archaic Societies."
	Margaret Mead does her first fieldwork in Samoa.
1926	Paul Radin publishes *Crashing Thunder: The Autobiography of an American Indian*.
	Prague Linguistic Circle founded.
1928	Paul Rivet elected professor of Museum Anthropology.
1929–1935	Antonio Gramsci writes his prison notebooks.
1929	University of Michigan Department of Anthropology founded.
1930	Robert Redfield publishes *Tepoztlan, A Mexican Village: A Study of Folk Life*.

1931–1937	A. R. Radcliffe-Brown teaches at the University of Chicago.
1931	Edward Sapir becomes Sterling professor at Yale.
1934	Ruth Benedict publishes *Patterns of Culture*.
1936	A. R. Radcliffe Brown appointed professor of anthropology at Oxford University.
	Walter Benjamin publishes "The Work of Art in the Age of Mechanical Reproduction."
1937	E. E. Evans-Pritchard publishes *Witchcraft, Oracles and Magic Among the Azande*.
1938	Benjamin Lee Whorf visits the Hopi reservation in Arizona.
	Paris Museum of Mankind (Musée de l'Homme) opens.
1939	George Peter Murdock and colleagues publish *Outline of Cultural Materials*.
1940	E. E. Evans-Pritchard and Meyer Fortes publish *African Political Systems*.
1941	Axel Leonard Wenner-Gren establishes the Viking Fund (after 1951, the Wenner-Gren Foundation).
	Melville Herskovits publishes *The Myth of the Negro Past*.
1942	Death of Bronisław Malinowski.
	Death of Franz Boas.
	Kenneth Pike becomes president of the Summer Institute of Linguistics.
1943	Leslie White publishes "Energy and the Evolution of Culture."
1944	Karl Polanyi publishes *The Great Transformation*.
1946–1952	Julian Steward teaches at Columbia University.
1947	Max Gluckman founds the Department of Social Anthropology at the University of Manchester (Manchester School).
1949	Claude Lévi-Strauss publishes *The Elementary Forms of Kinship*.
	Human Relations Area Files (HRAF) founded at Yale University.
1950	Death of Marcel Mauss.
1951	Jacques Lacan begins to give seminars in Paris. The seminars continue until 1980.
	Niko Tinbergen publishes *The Study of Instinct*.
1954	Edmund Leach publishes *Political Systems of Highland Burma*.
	Harry Hoijer coins the term "Sapir-Whorf Hypothesis."
1955	Death of A. R. Radcliffe-Brown.
	Julian Steward publishes *Theory of Culture Change*.
	Noam Chomsky publishes *Logical Structures of Linguistic Theory*.
1956	Ward Goodenough publishes "Componential Analysis and the Study of Meaning."
1957	Karl Wittfogel publishes *Oriental Despotism*.
1958	*Current Anthropology* founded.
1959	English version of Karl Popper's 1935 *The Logic of Scientific Discovery* is published.
	Leslie White publishes *The Science of Culture*.
	Oscar Lewis publishes *Five Families; Mexican Case Studies in the Culture of Poverty*.
1960s	Formalist/Substantivist debate.
1960	Jean Rouche films and produces *Chronique d'un été*.
1961	Franz Fanon publishes *The Wretched of the Earth*.
1962–1963	Roy Rappaport conducts fieldwork among Tsembaga Maring in Papua New Guinea.
1962	Claude Lévi-Strauss publishes *The Savage Mind*.

1962 Jürgen Habermas publishes *The Structural Transformation of the Public Sphere*.
Pierre Bourdieu's first published use of the term *habitus*.
1963 Erving Goffman publishes *Stigma: Notes on the Management of Spoiled Identity*.
1966 Louis Dumont publishes *Homo Hiarchicus*.
Marvin Harris publishes "The Cultural Ecology of India's Sacred Cattle."
Mary Douglas publishes *Purity and Danger*.
1967 Jacques Derrida publishes *Of Grammatology*.
1968 David Schneider publishes *American Kinship: A Cultural Account*.
Marvin Harris publishes *The Rise of Anthropological Theory*.
Roy Rappaport publishes *Pigs for the Ancestors*.
1969 Michel Foucault publishes *Archaeology of Knowledge*.
Victor Turner publishes *The Ritual Process*.
1970 Roland Barthes publishes *S/Z*.
1972 Death of Julian Steward.
Eleanor Burke Leacock publishes an introduction and notes for Friedrich Engels's *The Origin of the Family, Private Property, and the State*.
René Girard publishes *Violence in the Sacred*.
William Labov publishes *Language in the Inner City*.
1973 Clifford Geertz publishes *The Interpretation of Cultures*.
Death of E. E. Evans-Pritchard.
Ethos, flagship journal of the Society for Psychological Anthropology, commences publication.
Marshall Sahlins publishes *Stone Age Economics*.
Sherry Ortner publishes "On Key Symbols."
1974 Immanuel Wallerstein publishes the first volume of *The Modern World-System*.
1975 Death of Leslie White.
Death of Max Gluckman.
Edward Osborne Wilson publishes *Sociobiology: The New Synthesis*.
1977 Paul Rabinow publishes *Reflections on Fieldwork in Morocco*.
1978 Edward Said publishes *Orientalism*.
1979 June Nash publishes *We Eat the Mines and the Mines Eat Us*.
1980 Pierre Bourdieu publishes *The Logic of Practice*.
1981 Michelle Zimbalist Rosaldo publishes *Knowledge and Passion: Ilongot Notions of Self and Social Life*.
1982 Eric Wolf publishes *Europe and the People Without History*.
1983 Benedict Anderson publishes *Imagined Communities*.
Death of Victor Turner.
Paul Rabinow and Hubert Dreyfus publish *Michel Foucault: Beyond Structuralism and Hermeneutics*.
1984 Death of Michel Foucault.
Neil Smith publishes *Uneven Development*.

1985	Marshall Sahlins publishes *Islands of History.*
	Sidney Mintz publishes *Sweetness and Power.*
1986	George Marcus and Michael M. J. Fischer publish *Anthropology as Cultural Critique: An Experimental Moment in the Human Sciences.*
	James Clifford and George Marcus publish *Writing Culture: The Poetics and Politics of Ethnography.*
1987	Death of Eleanor Leacock.
	Stephen Tyler publishes *The Unspeakable: Discourse, Dialogue, and Rhetoric in the Postmodern World.*
1988	Gayatri Chakravorty Spivak publishes "Can the Subaltern Speak?"
1989	David Harvey publishes *The Condition of Postmodernity.*
	Renato Rosaldo publishes *Culture and Truth: The Remaking of Social Analysis.*
1990	Arjun Appadurai publishes "Disjuncture and Difference in the Global Cultural Economy."
	Judith Butler publishes *Gender Trouble: Feminism and the Subversion of Identity.*
1992	Barbara Tedlock publishes *The Beautiful and the Dangerous.*
	Jerome Barkow, Leda Cosmides, and John Tooby publish *The Adapted Mind: Evolutionary Psychology and the Generation of Culture.*
	Nancy Scheper-Hughes publishes *Death Without Weeping: The Violence of Everyday Life in Brazil.*
1993	Lila Abu-Lughod publishes *Writing Women's Worlds: Bedouin Stories.*
	Partha Chatterjee publishes *The Nation and Its Fragments.*
1995	Death of David Schneider.
1997	Death of Roy Rappaport.
1998	Christopher Chase-Dunn and Thomas D. Hall publish *Rise and Demise: Comparing World Systems.*
1999	Death of Eric Wolf.
	Setha Low publishes *Theorizing the City.*
2000	Death of Kenneth Pike.
	Maurice Godelier becomes the founding director of the Musée du Quai Branly.
2001	Death of Marvin Harris.
2002	Death of Pierre Bourdieu.
2003	Death of Edward Said.
2004	Death of Jacques Derrida.
2006	Death of Clifford Geertz.
	Sherry Ortner publishes *Anthropology and Social Theory: Culture, Power and the Acting Subject.*
2007	Death of Mary Douglas.
2009	Death of Claude Lévi-Strauss.
2012	Edward O. Wilson publishes *The Social Conquest of Earth.*
